ltdirchk.dtx

1 L^AT_EX System Dependent Initializations

This file implements the semi-automatic determination of various system dependent parts of the initialization. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}{space}` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `{space}`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `{dir}` is an entry in the input path, T_EX will try to load the expansion of `{dir}{filename}{space}`

So either `{dir}` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `{filename}`. This means that for UNIX-like syntax, each `{dir}` should end with a slash, /.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse` After a call of the form: `\filename@parse{filename}`, the three macros `\filename@area`, `\filename@base` and `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `{filename}`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS T_EX versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` `\@TeXversion` is now set automatically by the initialization tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation is left for information. L^AT_EX does not set this variable exactly, the automatic tests set it to:
2 for any version, v , $v < 3.0$
3 for any version, v , $3.0 \leq v \leq 3.14$

<undefined> otherwise.

However these values are accurate enough for L^AT_EX to take appropriate action for these old T_EXs.

If your T_EX is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this¹, L^AT_EX will not work around a bug in old T_EX versions, and so error messages will appear in a very strange format, with `^J` appearing instead of line breaks:

```
LaTeX Error: \rubbish undefined.^J^JSee the LaTeX manual or LaTeX=Companion  
for explanation.^JType H <return> for immediate help.  
...  
.3 \renewcommand{\rubbish}  
{}
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
LaTeX Error: \rubbish undefined.  
See the LaTeX manual or LaTeX Companion for explanation.  
Type H <return> for immediate help.  
.  
...  
.3 \renewcommand{\rubbish}  
{}
```

Note that this has an extra line ! . which does not appear in error messages that use the default settings with a current version of T_EX, but this should not cause any confusion we hope.

2 Initialization

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

Most such definitions are repeated later in the “right” place, usually (but not always) with different implementations. To be able to spot this more easily if you look into the file `latex.ltx` (which is stripped of comments) we add some comment lines to that effect that survive the stripping process by `docstrip`.

```
1 <*dircheck>  
2 %% ---- START temporary definitions for bootstrapping; later overwritten ----  
3 </dircheck>
```

¹Actually if your T_EX is really old, version 2, L^AT_EX can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

2.1 INITEX

```

4  <*dircheck>
5  <*initex>
6  <initex> \ifnum\catcode`\\=1
7  <initex>   \errmessage
8  <initex>   {LaTeX must be made using an initex with no format preloaded}
9  <initex> \fi
10 \catcode`\\=1
11 \catcode`\\=2

```

If LuaTeX is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of LuaTeX do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```

12 \ifx\directlua\undefined
13 \else
14   \ifx\luatexversion\undefined

```

Enable e-TeX/pdfTeX/Umath primitives with their natural names

```

15   \directlua{tex.enableprimitives("",%
16             tex.extraprimitives('etex', 'pdftex', 'umath'))}

```

In current formats enable primitives with unprefixed names. the `\textralaterelease` guards allow the primitives to be defined with a `\luatex` prefix if older formats are specified.

```

```

(End definition for `\strip@prefix`.)

3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between START and END is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

```

116  {*docstrip}

```

START

3.1 texsys.cfg

This file contains the site specific definitions of the four macros `\@currdir`, `\input@path`, `\filename@parse` and `\@TeXversion`.

As distributed it only contains comments, however this ‘empty’ file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You are allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir` `\@currdir<filename><space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, TeX will try to load the expansion of `<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, /. One exception to this rule is that the input path should always contain the empty directory {} as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TeX versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` You should not need to set this macro in `texsys.cfg`. LATEX tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all

of which do not need this file as the automatic tests work. All the code is commented out.

3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
133 % \def\@currdir{./}
134 % \let\input@path\@undefined
```

3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
135 % \def\@currdir{./}
136 % \def\input@path{%
137 %   {/usr/local/lib/tex/inputs/distrib/}%
138 %   {/usr/local/lib/tex/inputs/contrib/}%
139 %   {/usr/local/lib/tex/inputs/local/}%
140 % }
```

3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
141 % \def\@currdir{./}
142 % \let\input@path\@undefined
```

3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
143 % \def\@currdir{./}
144 % \def\input@path{%
145 %   {c:/tex/inputs/distrib/}%
146 %   {c:/tex/inputs/contrib/}%
147 %   {c:/tex/inputs/local/}%
148 % }
```

3.6 VMS (DECUS T_EX, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
149 % \def\@currdir{[]}
150 % \let\input@path\@undefined
```

3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
151 % \def\@currdir{[]}
152 % \def\input@path{%
153 %   {tex_inputs:}%
154 %   {SOMEDISK:[SOME.TEX.DIRECTORY]}%
155 % }
```

3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
156 % \def\@currdir{::}
157 % \let\input@path\@undefined
```

3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with `:`, and they should contain *no* spaces.

```
158 % \def\@currdir{::}
159 % \def\input@path{%
160 %   {Hard-Disk:Applications:TeX:TeX-inputs:}%
161 %   {Hard-Disk:Applications:TeX:My-inputs:}%
162 % }
```

3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form `<area>name`. For maximum compatibility with macro sets, you want `name.ext` to be mapped to `<ext>name`, and `<area>name.ext` to be mapped to `<area.ext>name`. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. `<>name` is the desired ‘current directory’ syntax.

the following code would possibly work:

```
163 % \def\@dir#1#2 {%
164 %   \@dcr{#1}#2..\@nil%
165 % \def\@dcr#1#2.#3.#4\@nil{%
166 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 %
167 %
168 % \def\@currdir{\@dir{}}
169 % \def\input@path{%
170 %   {\@dir{area.one}}%
171 %   {\@dir{area.two}}%
172 % }
```

END

```
173 \immediate\closeout15
```

If `texsys.cfg` did exist, then input it.

```
174 \else
175 \typeout{** Using the existing texsys.cfg}
176 \closein15
177 \input texsys.cfg
178 \fi
179 \{/docstrip\}
```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```
180 \dircheck\input texsys.cfg
```

4 Setting `\@currdir`

`\@currdir` This is a local definition of `\IfFileExists`. It tries to relocate `texsys.aux`. If it succeeds, then the `\@currdir` syntax has been determined. If all the tests fail then `\@currdir` will be set to `\@empty`, and `ltxcheck` will warn of this when it checks the format.

```
181 \begingroup
182 \count@\time
183 \divide\count@ 60
184 \count2=-\count@
185 \multiply\count2 60
186 \advance\count2 \time
```

The current date and time stamp.

```
187 \edef\today{%
188   \the\year/\two@digits{\the\month}/\two@digits{\the\day}:
189   \two@digits{\the\count@}:\two@digits{\the\count2}}
```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```
190 \immediate\openout15=texsys.aux
191 \immediate\write15{\today^J}
192 \immediate\closeout15 %
```

#1 is the file to try, #2 is what to do on success, #3 on failure. Note that this definition is overwritten later on again!

```
193 \def\IfFileExists#1#2#3{%
194   \openin\@inputcheck#1 %
195   \ifeof\@inputcheck
196     #3\relax
197   \else
198     \read\@inputcheck to \reserved@a
199     \ifx\reserved@a\today
200       \typeout{#1 found}#2\relax
201     \else
202       \typeout{BAD: old file \reserved@a (should be \today)}%
203       #3\relax
204     \fi
205   \fi
206   \closein\@inputcheck}
```

```

207 \endlinechar=-1
If \@currdir has not been pre-defined in texsys.cfg then test for UNIX, VMS and
Oz-TEX-Mac. syntax.
208 \ifx\@currdir\@undefined
209   \IfFileExists{./texsys.aux}{\gdef\@currdir{./}}%
210   {\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%
211   {\IfFileExists{texsys.aux}{\gdef\@currdir{}}{}}

```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces a format with no user-interaction. Later if the format is not suitable for the system, **texsys.cfg** may be edited and the format re-made.

```

212 \ifx\@currdir\@undefined
213   \global\let\@currdir\@empty
214   \typeout{\string^J^J%
215     !! No syntax for the current directory could be found\string^J%
216   }%
217 \fi

```

Otherwise \@currdir was defined in **texsys.cfg**. In this case check that the syntax specified works on this system. (In case a complete **LATEX** system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending **texsys.cfg** and try again.

```

218 \else
219   \IfFileExists{@currdir texsys.aux}{}{%
220     \edef\reserved@a{\errhelp{%
221       texsys.cfg specifies the current directory syntax to be\string^J%
222       \meaning\@currdir\string^J%
223       but this does not work on this system.\string^J%
224       Remove texsys.cfg and restart.}}\reserved@a
225     \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@@end}

```

The version of \@currdir in **texsys.cfg** looks OK.

```

226 \fi
227 \immediate\closeout15 %
228 \endgroup
229 \typeout{\string^J^J%
230   \noexpand\@currdir set to:
231   \expandafter\strip@prefix\meaning\@currdir.\string^J%
232 }

```

(End definition for \@currdir, \IfFileExists, and \today.)

Stop here if the file is being used unstripped.

```

233 <*docstrip>
234 \relax\endinput
235 </docstrip>

```

5 Setting \input@path

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found to be very reliable. The first-time installer of L^AT_EX 2_E can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through L^AT_EX 2_E. This will check, among other things, whether `texsys.cfg` will need to be edited and the format remade.

`\input@path` Now set up the `\input@path`.

`\input@path` should either be undefined, or a list of directories as described in the introduction.

```
236   \typeout{^^J%
237     Assuming \noexpand\openin and \noexpand\input^^J%
238     \ifx\input@path\@undefined
```

`\input@path` has not been pre-defined.

```
239     have the same search path.^^J%
240   \else
```

`\input@path` has been defined in `texsys.cfg`.

```
241     have different search paths.^^J%
242     LaTeX will use the path specified by \noexpand\input@path:^^J%
243   \fi
244 }
```

(End definition for `\input@path`.)

6 Filename Parsing

`\filename@parse` Split a filename into its components.

```
245 \ifx\filename@parse\@undefined
246   \def\reserved@a{./}\ifx\@currdir\reserved@a
```

`\filename@parse` was not specified in `texsys.cfg`, but `\@currdir` looks like UNIX...

```
247   \typeout{^^JDefining UNIX/DOS style filename parser.^^J}
248   \def\filename@parse#1{%
249     \let\filename@area\empty
250     \expandafter\filename@path#1\\}
```

Search for the last /.

```
251   \def\filename@path#1/#2\\{%
252     \ifx\\#2\\%
253       \def\reserved@a{\filename@simple#1.\\}%
254     \else
255       \edef\filename@area{\filename@area#1}%
256       \def\reserved@a{\filename@path#2\\}%
257     \fi
258   \reserved@a}
259 \else\def\reserved@a{}{}\ifx\@currdir\reserved@a
```

```

\filename@parse was not specified in texsys.cfg, but \currdir looks like VMS...
260   \typeout{^^JDefining VMS style filename parser.^^J}
261   \def\filename@parse#1{%
262     \let\filename@area\empty
263     \expandafter\filename@path#1\\}

7 TeX Versions

`\@TeXversion` TeX versions older than 3.141 require `\@TeXversion` to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg TeX3.14 would be detected as TeX3, but L^AT_EX only needs to take account of TeX's older than 3, or between 3 and 3.14.

```

329 \ifx\@TeXversion\undefined

340 ⟨/dircheck⟩
```

8 ltxcheck.tex

After the format has been made, and article.cls moved with the other files to the ‘standard input directory’ as specified in `install.txt`, the format may be checked by running the file `ltxcheck.tex`.

File b

ltplain.dtx

1 Plain T_EX

L^AT_EX includes almost all of the functionality of Knuth's original 'Basic Macros'. That is, the plain T_EX format described in Appendix B of the T_EXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep     \magstephalf  
\mathhexbox  
\vglue      \vgl@  
\hglue      \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L^AT_EX font definitions are done using NFSS2 so none of PLAIN's font definitions are in L^AT_EX.

L^AT_EX has its own tabbing environment, so PLAIN's is disabled.

L^AT_EX uses its own output routine, so most of the plain one was removed.

```
1  {*2ekernel}  
2  \catcode`{\=1 % left brace is begin-group character  
3  \catcode`}=\=2 % right brace is end-group character  
4  \catcode`$=\=3 % dollar sign is math shift  
5  \catcode`&=\=4 % ampersand is alignment tab  
6  \catcode`#=\=6 % hash mark is macro parameter character  
7  \catcode`^=\=7 % circumflex and uparrow are for superscripts  
8  \catcode`_=\=8 % underline and downarrow are for subscripts  
9  \catcode`^^I=\=10 % ascii tab is a blank space  
10 \chardef\active=13 \catcode`~=\active % tilde is active  
11 \catcode`^^L=\active \def^^L{\par}% ascii form-feed is \par  
12 \message{catcodes,}
```

We had to define the \catcodes right away, before the message line, since \message uses the { and } characters. When INITEX (the T_EX initializer) starts up, it has defined the following \catcode values:

```
\catcode`^^@=\=9 % ascii null is ignored  
\catcode`^^M=\=5 % ascii return is end-line  
\catcode`\\=\=0 % backslash is TeX escape character  
\catcode`%=\=14 % percent sign is comment character  
\catcode` =\=10 % ascii space is blank space  
\catcode`^^?=\=15 % ascii delete is invalid  
\catcode`A=\=11 ... \catcode`Z=\=11 % uppercase letters  
\catcode`a=\=11 ... \catcode`z=\=11 % lowercase letters  
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do\ \do\\\do\{\do\}\do\$\\do\&%  
14 \do\#\do\^\do\_\\do\%\do\~}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

15 \catcode`@=11

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

\@ne Small constants are defined using \chardef.

\tw@ 16 \chardef\@ne=1

\thr@@ 17 \chardef\tw@=2

\sixt@@n 18 \chardef\thr@@=3

\@cclv 19 \chardef\sixt@@n=16

20 \chardef\@cclv=255

(End definition for \@ne and others.)

\@cclvi Constants above 255 defined using \mathchardef.

\@m 21 \mathchardef\@cclvi=256

\@M 22 \mathchardef\@m=1000

\@MM 23 \mathchardef\@M=10000

24 \mathchardef\@MM=20000

(End definition for \@cclvi and others.)

Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

25 \message{registers,}

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

The following counters are reserved:

0 to 9 page numbering

10 count allocation

11 dimen allocation

12 skip allocation

13 muskip allocation

14 box allocation

15 toks allocation

16 read file allocation

17 write file allocation

18 math family allocation

19 language allocation

20 insert allocation

21 the most recently allocated number

22 constant -1
End of historical L^AT_EX 2.09 comments.

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, \count 10 always contains the number of the highest-numbered counter that has been allocated, \count 14 the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a \count, \dimen, \skip, and \box all with the same number; \count 20 contains the lowest-numbered insert that has been allocated. Of course, \box255 is reserved for \output; \count255, \dimen255, and \skip255 can be used freely.

It is recommended that macro designers always use \global assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-\global assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```
26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...
36 \count20=255 % allocates insertions 254, 253, ...
```

\insc@unt The insertion counter and most recent allocation.
\allocationnumber

46 \toksdef\toks@=0
```

(End definition for `\count@` and others.)

```
\newcount Now, we define \newcount, \newbox, etc. so that you can say \newcount\foo and \foo  
\newdimen will be defined (with \countdef) to be the next counter.  
\newskip To find out which counter \foo is, you can look at \allocationnumber.  
\newmuskip Since there's no \boxdef command, \chardef is used to define a \newbox,  
\newbox, \newinsert, \newfam, and so on.  
\newtoks LATEX change: remove \outer from \newcount and \newdimen (FMi) This is nec-  
\newread essary to use \newcount inside \if... later on. Also remove from \newskip, \newbox  
\newwrite and \newfam (DPC) to save later redefinition.

```

In the past `\LaTeX{}` used the default value of `\texttt{1}` for `\cs{tracinglostchars}` because this was the best it could do. This way one would at least get a warning in the `\texttt{.log}` file. e-`\TeX{}` improved on that and supported a value of `\texttt{2}` to show the warning on the terminal, so we could have changed the default when we made the e-`\TeX{}` extensions required—however, we overlooked that opportunity.

In 2021 this parameter was improved on again and now also accepts the value `\texttt{3}`

(error on the terminal). This made us realize that we should change the default. Using `\texttt{3}` would really be the best, but for compatibility reasons we only use `\texttt{2}`.

`\changes{v2.3g}{2021/07/16}{Use 2 as default value for \cs{tracinglostchars}}`

```

(End definition for \bgroup and \egroup.)

\obeylines In \obeylines, we say \let^{^^M}=\obeyedline instead of \def^{^^M}{\obeyedline} since this allows, for example, \let\obeyedline=\cr \obeylines \halign{....}

This is essentially a plain T_EX trick and in its original version where you had to use to use \let\par=\cr not really a safe idea in L^AT_EX. If anybody used this trick this now breaks (and one needs to use \obeyedline instead).

```
419 </2ekernel>  
420 <*2ekernel | latexrelease>  
421 <latexrelease>\IncludeInRelease{2022/06/01}{\obeylines}%  
422 <latexrelease> {Add a redirection to obeylines and obeyspaces}%
```

If the active ^{^^M} escapes, e.g. into a \write (which is effectively in a different context) we don't want the definition from \obeylines but rather a simple \par (in fact even the primitive one, not the L^AT_EX version \para_end: which is only defined later).

```
423 \begingroup  
424 \catcode`^^M=\active % these lines must end with %  
425 \gdef\obeylines{\catcode`^^M\active%  
426 \let^^M\obeyedline%
```

The next line ending the definition is rather curious and it took me awhile to understand why rollback fails. The problem is the following: if `\textrlease` is used, then blocks of `\IncludeInRelease ... \EndIncludeInRelease` are bypassed at high speed by grabbing each as a delimited argument. However, in that case `^M` is seen not as code but as line ending characters and in that mode `TEX` discards everything from that point onwards to the real end of the line so it works like a comment — pretty strange really (and I think due to the fact the the original pascal compiler could have some garbage showing up after the normal line ending character). Thus we really have to make sure that any closing braces is not one the same line as an `^M`, because otherwise it would get dropped and we end with unbalanced braces and never see the `\EndIncludeInRelease` — weird. In other places it doesn't matter because we aren't using the incomplete result.

```
427  }%
428  \global\let^M\par % this is in case ^M appears in a \write
429  \endgroup
```

`\obeyedline` The `\obeyedline` expands by default to `\par` with whatever definition `\par` has when it is executed. It can, however, be redefined (before calling `\obeylines!`) to achieve some special effects. If you want to alter its definition when already in the scope of `\obeylines`, it has no effect (because `\let` is used above). In that case simply make another call to `\obeylines` immediately. As you are in a restricted scope all that happens is that your redefinition is applied.

For the default definition we have to use `\def` not `\let` because the meaning of `\par` can change and we want to use the one that is current when `\obeylines` act.

There is a small subtlety here: in an `\edef` the active `^M` stayed put (because it was equal to the primitive `\par`), now `\obeyedline` expands and you get what it contains, i.e., in that case `\par`, into the `\edef` or `\mark` unless we use `\protected` on it.

```
430 \protected\gdef\obeyedline{\par}
```

The definition of `\obeyspaces` is changed in the same way and now executes `\obeyedspace` for each active space.

```
\obeyedspace
431 \global\let\obeyedspace\space
432 \begingroup
433 \catcode`\ =\active%
434 \gdef\obeyspaces{\catcode`\ \active\let =\obeyedspace}%

```

An active space elsewhere generates `\space` by default (for example in a `\write`).

```
435 \global\let =\space%
436 \endgroup
437 {/2ekernel | \textrlease}
438 {|\textrlease}\EndIncludeInRelease
439 {|\textrlease}\IncludeInRelease{0000/00/00}{\obeylines}%
440 {|\textrlease} {Add a redirection to obeylines and obeyspaces}%
441 {|\textrlease}
```

From 2019 onwards the commands are made robust (somewhat later in the kernel sources). So if we roll back they are robust, so when redefining them we have to get rid of the robust payload first. Otherwise that is seen by the later rollback below, which then installs a fragile version of the new definition on top of the one we roll back to here, sigh. `\kernel@make@fragile` also changes its definition (later own) so this is done directly.

```
442 {|\textrlease}\expandafter\let\csname obeylines \endcsname\@undefined
```

```

443 <|latexrelease>\expandafter\let\csname obeyspace \endcsname\@undefined
444 <|latexrelease>
445 <|latexrelease>\begingroup
446 <|latexrelease>\catcode`^\^M=\active % these lines must end with %
447 <|latexrelease> \gdef\obeylines{\catcode`^\^M\active \let^\^M\par %

```

Closing brace on a separate line (see comment above).

```
448 <|latexrelease> }%
```

Another pitfall: if we do a rollback `\par` is no longer the primitive, so the roll back definition needs `\let` to what is now the primitive.

```

449 <|latexrelease> \global\let^\^M\RawParEnd % this is in case `^\^M appears in a \write
450 <|latexrelease>\endgroup
451 <|latexrelease>\def\obeyspaces{\catcode`\ \active}
452 <|latexrelease>
453 <|latexrelease>\let\obeyedline\@undefined
454 <|latexrelease>\let\obeyedspace\@undefined
455 <|latexrelease>\EndIncludeInRelease
456 <|*2ekernel>

```

(*End definition for `\obeylines` and others.*)

`\loop` We use Kabelschacht's method of doing loops, see TUB 8#2 (1987). (unless that breaks
`\iterate` something :-). It turned out to need an extra `\relax`: see pr/642 (`\loop` could do one
`\repeat` iteration too much in certain cases).

```

457 \long\def \loop #1\repeat{%
458   \def\iterate{\#1\relax % Extra \relax
459             \expandafter\iterate\fi
460           }%
461   \iterate
462   \let\iterate\relax
463 }

```

This setting of `\repeat` is needed to make `\loop... \if... \repeat` skippable within another `\if....`

```
464 \let\repeat=\fi
```

(*End definition for `\loop`, `\iterate`, and `\repeat`.*)

`\TeX` defines `\sim` in `ltdefns.dtx`.

`\slash` This generates a / acting a bit like – but still allows hyphenation in the word part preceding it (but not after).

```
474 \def\slash{\penalty\exhyphenpenalty}
```

(End definition for `\slash`.)

`\break`

```
475 \def\break{\penalty-\@M}
```

`\nobreak`

```
476 \def\nobreak{\penalty \@M}
```

`\allowbreak`

```
477 \def\allowbreak{\penalty \z@}
```

(End definition for `\break`, `\nobreak`, and `\allowbreak`.)

`\filbreak`

`\goodbreak`

```
478 \def\filbreak{\par\vfil\penalty-200\vfilneg}
```

```
479 \def\goodbreak{\par\penalty-500 }
```

(End definition for `\filbreak` and `\goodbreak`.)

`\eject` Define `\eject` as in plain `\TeX` but define `\supereject` only in the compatibility file.

```
480 \def\eject{\par\break}
```

(End definition for `\eject`.)

`\removelastskip`

```
481 \def\removelastskip{\ifdim\lastskip=\z@\else\vskip-\lastskip\fi}
```

(End definition for `\removelastskip`.)

`\smallbreak`

`\medbreak`

```
482 \def\smallbreak{\par\ifdim\lastskip<\smallskipamount}
```

`\bigbreak`

```
483 \removelastskip\penalty-50\smallskip\fi}
```

```
484 \def\medbreak{\par\ifdim\lastskip<\medskipamount}
```

```
485 \removelastskip\penalty-100\medskip\fi}
```

```
486 \def\bigbreak{\par\ifdim\lastskip<\bigskipamount}
```

```
487 \removelastskip\penalty-200\bigskip\fi}
```

(End definition for `\smallbreak`, `\medbreak`, and `\bigbreak`.)

`\m@th`

```
488 \def\m@th{\mathsurround\z@}
```

(End definition for `\m@th`.)

`\underbar` Due to `\TeX`'s redefinition of `\underline` plain `\TeX`'s `\underbar` can be done in a simpler fashion (but do we need it at all?).

```
489 \def\underbar{\underline{\sbox\tw@{\#1}\dp\tw@\z@\box\tw@}}
```

(End definition for `\underbar`.)

`\strutbox` `\TeX` sets `\strutbox` in `\set@fontsize`.

`\strut`

```
490 \newbox\strutbox
```

```
491 \def\strut{\relax\ifmmode\copy\strutbox\else\unhcopy\strutbox\fi}
```

(End definition for `\strutbox` and `\strut`.)

`\hidewidth` For alignment entries that can stick out.

492 `\def\hidewidth{\hskip\hideskip}`

(End definition for `\hidewidth`.)

`\narrower`

493 `\def\narrower{%`
494 `\advance\leftskip\parindent`
495 `\advance\rightskip\parindent}`

(End definition for `\narrower`.)

`\textrm` defines `\ae` and similar commands elsewhere.

496 `\chardef\%='\%`
497 `\chardef\&='\&`
498 `\chardef\#= '\#`

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

`\leavevmode` begins a paragraph, if necessary

499 `\def\leavevmode{\unhbox\voidb@x}`

(End definition for `\leavevmode`.)

`\mathhexbox`

500 `\def\mathhexbox#1#2#3{\mbox{$\m@th \mathchar"#1#2#3$}}`

(End definition for `\mathhexbox`.)

`\ialign`

501 `\def\ialign{\everycr{}\tabskip\z@skip\halign} % initialized \halign`

(End definition for `\ialign`.)

`\oalign`

502 `\def\oalign#1{\leavevmode\vtop{\baselineskip\z@skip \lineskip.25ex%`
503 `\ialign{\##\crcr#1\crcr}}}`
504 `\def\o@align{\lineskip\z@\oalign}`
505 `\def\ooalign{\lineskip\z@-\maxdimen \oalign}`

(End definition for `\oalign`, `\o@align`, and `\ooalign`.)

`\sh@ft` The definition of this macro in plain.tex was improved in about 1997; but as a result its usage was changed and its new definition is not appropriate for `\textrm`.

Since the version given here has been in use by `\textrm` for many years it does not seem prudent to remove it now. As far as we can tell it has only been used to define `\b` and `\d` but this cannot be certain.

506 `\def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font`
507 `\kern-.0156\dimen@} % compensate for slant in lowered accents`

(End definition for `\sh@ft`.)

`\ltx@sh@ft` This is the L^AT_EX version of the second incarnation of the plain macro `\sh@ft`, which takes a dimension as its argument. It shifts a pseudo-accent horizontally by an amount proportional to the product of its argument and the slant-per-point (fontdimen 1).

```
508 \def\ltx@sh@ft #1{%
509   \dimen@ #1%
510   \kern \strip@pt
511   \fontdimen1\font \dimen@
512 } % kern by #1 times the current slant
```

(End definition for `\ltx@sh@ft`.)

L^AT_EX change: the text commands such as `\d`, `\b`, `\c`, `\copyright`, `\TeX` are now defined elsewhere.

L^AT_EX change: Make `\t` work in a moving argument. Now defined elsewhere.

`\hrulefill` L^AT_EX change: `\kern\z@` added to end of `\hrulefill` and `\dotfill` to make them work in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). L^AT_EX change: `\leavevmode` added at beginning of `\dotfill` and `\hrulefill` so that they work as expected in vertical mode.

```
513 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}
```

The box in `\dotfill` originally contained (in plain.tex):

```
\mkern 1.5mu . \mkern 1.5mu;
```

the width of $.44em$ differs from this by $.04pt$ which is probably an acceptable difference within leaders.

```
514 \def\dotfill{%
515   \leavevmode
516   \cleaders \hb@xt@ .44em{\hss.\hss}\hfill
517   \kern\z@}
```

(End definition for `\hrulefill` and `\dotfill`.)

INITEX sets `\sfcode x=1000` for all x , except that `\sfcode 'X=999` for uppercase letters. The following changes are needed:

```
518 \sfcode`'=0 \sfcode`'=0 \sfcode`]=0
```

The `\nonfrenchspacing` macro will make further changes to `\sfcode` values.

Definitions related to output

`\magnification` doesn’t work in L^AT_EX.

```
def\magnification{\afterassignment\m@g\count@}
def\m@g{\mag\count@
\hsize6.5truein\vsiz8.9truein\dimen\footins8truein}
```

`\showoverfull` The following commands are used in debugging:

```
519 \def\showoverfull{\tracingonline@ne}
```

(End definition for `\showoverfull`.)

`\showoutput`

```
\loggingoutput
520 \gdef\loggingoutput{\tracingoutput@ne
521   \showboxbreadth\maxdimen\showboxdepth\maxdimen\errorstopmode}
522 \gdef\showoutput{\loggingoutput\showoverfull}
523 </2ekernel>
```

(End definition for `\showoutput` and `\loggingoutput`.)

File c

ltvers.dtx

1 Version Identification

First we identify the date and version number of this release of L^AT_EX, and set \everyjob so that it is printed at the start of every L^AT_EX run.

```
\fmtname
\fmtversion
\latexreleaseversion
\patch@level
```

A \patch@level of 0 or higher denotes an official public release. A negative value indicates a candidate release that is not distributed.

If we put code updates into the kernel that are supposed to go into the next release we set the \patch@level to -1 and the \fmtversion / \latexreleaseversion to the dated of the next release (guessed, the real value is not so important and will get corrected when we make the release official).

If the \patch@level is already at -1 we do nothing here and use the \fmtversion date for any new \IncludeInRelease line when we add further code.

Finally, if we do make a public release we either just set the \patch@level to zero (if our initial guess was good) or we also change the date and then have to additionally change to that date on all the \IncludeInRelease statements that used the “guessed” date.

```
1  {*2ekernel}
2  \def\fmtname{LaTeX2e}
3  \edef\fmtversion
4  {/2ekernel}
5  <texrelease>\edef\latexreleaseversion
6  {*2ekernel | latexrelease}
7  {2022-06-01}
8  {/2ekernel | latexrelease}
9  {*2ekernel}
10 \def\patch@level{5}
```

For more fine grain control there is the possibility to name the current development branch. This is only used when the \patch@level is negative (i.e., a pre-release format) and is intended to help us internally when we locally install a format out of some development branch.

```
\development@branch@name
11 \edef\development@branch@name{}
```

(End definition for \fmtname and others.)

Check that the format being made is not too old. The error message complains about ‘more than 5 years’ but in fact the error is not triggered until 65 months.

This code is currently not activated as we don’t know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

```
12 \iffalse
13 \def\reserved@a{\#1/\#2/\#3\@nil}%
14 \count@\year
15 \advance\count@-\#1\relax
16 \multiply\count@ by 12\relax
17 \advance\count@\month
18 \advance\count@-\#2\relax}
19 \expandafter\reserved@a\fmtversion\@nil
```

\count0 is now the age of this file in months. Take a generous definition of ‘year’ so this message is not generated too often.

```

If we roll back and the first patch already match then applying that is actually reapplying what is already in the format, i.e., it is useless and possibly allocating new registers. However, it makes the logic simpler so this is the way it is for now. In theory we could always jump over the first patch because that is only really needed for rolling forward. So maybe one day ...

1.1 Declaring an all-new module

```
\if@skipping@module
\NewModuleRelease
\EndModuleRelease
\new@module@skip
\new@modulename
\new@moduledate
```

When we have a whole new module, we can't roll back to a date where such module exists, otherwise hundreds of "command already defined" errors will pop up. But we can't skip it altogether either, because the module might have changes we still want applied, so a more detailed cherry-picking of code chunks have to be done.

```

198     \fi}

```

(End definition for `\if@skipping@module` and others.)

199 `/2ekernel | latexrelease`

File d

ltluatex.dtx

1 Overview

LuaTeX adds a number of engine-specific functions to TeX. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for LuaTeX at the L^AT_EX 2 _{ε} kernel level plus as a loadable file which can be used with plain TeX and L^AT_EX.

This file contains code for both TeX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following \count registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
\e@alloc@whatsit@count User whatsits (default 261)
\e@alloc@bytecode@count Lua bytecodes (default 262)
\e@alloc@luachunk@count Lua chunks (default 263)
```

(\count 256 is used for \newmarks allocation and \count 257 is used for \newXeTeXintercharclass with XeTeX, with code defined in `ltfinal.dtx`). With any L^AT_EX 2 _{ε} kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L^AT_EX 2 _{ε} kernel did not provide any functionality for the extended allocation area).

2 Core TeX functionality

The commands defined here are defined for possible inclusion in a future L^AT_EX format, however also extracted to the file `ltluatex.tex` which may be used with older L^AT_EX formats, and with plain TeX.

```
\newattribute \newattribute{\langle attribute\rangle}
Defines a named \attribute, indexed from 1 (i.e. \attribute0 is never defined). Attributes initially have the marker value -"7FFFFFFF ('unset') set by the engine.

\newcatcodetable \newcatcodetable{\langle catcodetable\rangle}
Defines a named \catcodetable, indexed from 1 (\catcodetable0 is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).

\newluafunction \newluafunction{\langle function\rangle}
Defines a named \luafunction, indexed from 1. (Lua indexes tables from 1 so \luafunction0 is not available).

\newluacmd \newluacmd{\langle function\rangle}
Like \newluafunction, but defines the command using \luadef instead of just assigning an integer.
```

```

\newprotectedluacmd \newluadef{\function}
    Like \newluacmd, but the defined command is not expandable.
\newwhatsit \newwhatsit{\whatsit}
    Defines a custom \whatsit, indexed from 1.
\newluabytecode \newluabytecode{\bytecode}
    Allocates a number for Lua bytecode register, indexed from 1.
\newluachunkname \newluachunkname{\chunkname}
    Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the
    register (without backslash) into the lua.name table to be used in stack traces.
\catcodetable@initex Predefined category code tables with the obvious assignments. Note that the latex and
\catcodetable@string atletter tables set the full Unicode range to the codes predefined by the kernel.
\catcodetable@latex \setattribute{\attribute}{\value}
\catcodetable@atletter \unsetattribute{\attribute}

\setattribute Set and unset attributes in a manner analogous to \setlength. Note that attributes
\unsetattribute take a marker value when unset so this operation is distinct from setting the value to
zero.

```

3 Plain T_EX interface

The `ltlualatex` interface may be used with plain T_EX using `\input{ltlualatex}`. This inputs `ltlualatex.tex` which inputs `etex.src` (or `etex.sty` if used with L^AT_EX) if it is not already input, and then defines some internal commands to allow the `ltlualatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T_EX, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `ltlualatex` code but implements a compatibility layer providing the interface of the original package.

4 Lua functionality

4.1 Allocators in Lua

```

new_attribute luatexbase.new_attribute(\attribute)
    Returns an allocation number for the \attribute, indexed from 1. The attribute will
    be initialised with the marker value -"7FFFFFFF ('unset'). The attribute allocation se-
    quence is shared with the TEX code but this function does not define a token using
    \attributedef. The attribute name is recorded in the attributes table. A metatable
    is provided so that the table syntax can be used consistently for attributes declared in
    TEX or Lua.

new_whatsit luatexbase.new_whatsit(\whatsit)
    Returns an allocation number for the custom \whatsit, indexed from 1.

new_bytecode luatexbase.new_bytecode(\bytecode)
    Returns an allocation number for a bytecode register, indexed from 1. The optional
    \name argument is just used for logging.

new_chunkname luatexbase.new_chunkname(\chunkname)
    Returns an allocation number for a Lua chunk name for use with \directlua and
    \latelua, indexed from 1. The number is returned and also \name argument is added
    to the lua.name array at that index.

new_luafunction luatexbase.new_luafunction(\functionname)

```

Returns an allocation number for a lua function for use with `\luafunction`, `\lateluafunction`, and `\luadef`, indexed from 1. The optional `<functionname>` argument is just used for logging.

These functions all require access to a named TeX count register to manage their allocations. The standard names are those defined above for access from TeX, e.g. `\e@alloc@attribute@count`, but these can be adjusted by defining the variable `<type>_count_name` before loading `ltluatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a TeX `\count` (`\countdef`'d token) called `attributetracker` in place of `\e@alloc@attribute@count`.

4.2 Lua access to TeX register numbers

```
registernumber luatexbase.registernumer(<name>)
```

Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by TeX. This package provides a function to look up the relevant number using LuaTeX's internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumer("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumer("#1") or "bad input")}%
}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@on}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with Lua^LA_TE_X then the following would be produced in the log and terminal output.

```
undefinedrubbish: \relax
    bad input
space: macro:->
    bad input
hbox: \hbox
    bad input
@MM: \mathchar"4E20
    20000
@tempdima: \dimen14
    14
@tempdimb: \dimen15
    15
strutbox: \char"B
    11
sixt@@n: \char"10
    16
myattr: \attribute12
    12
```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

4.3 Module utilities

```
provides_module luatexbase.provides_module(<info>)
```

This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L^AT_EX format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored.

```
module_info luatexbase.module_info(<module>, <text>)
module_warning luatexbase.module_warning(<module>, <text>)
module_error luatexbase.module_error(<module>, <text>)
```

These functions are similar to L^AT_EX's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done, you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

4.4 Callback management

```
add_to_callback luatexbase.add_to_callback(<callback>, <function>, <description>) Registers the <function> into the <callback> with a textual <description> of the function. Functions are inserted into the callback in the order loaded.
```

```
remove_from_callback luatexbase.remove_from_callback(<callback>, <description>) Removes the callback
```

function with $\langle description \rangle$ from the $\langle callback \rangle$. The removed function and its description are returned as the results of this function.

`in_callback luatexbase.in_callback($\langle callback \rangle$, $\langle description \rangle$)` Checks if the $\langle description \rangle$ matches one of the functions added to the list for the $\langle callback \rangle$, returning a boolean value.

`disable_callback luatexbase.disable_callback($\langle callback \rangle$)` Sets the $\langle callback \rangle$ to `false` as described in the LuaTeX manual for the underlying `callback.register` built-in. Callbacks will only be set to `false` (and thus be skipped entirely) if there are no functions registered using the callback.

`callback_descriptions` A list of the descriptions of functions registered to the specified callback is returned. `{}` is returned if there are no functions registered.

`create_callback luatexbase.create_callback($\langle name \rangle$, metatype, $\langle default \rangle$)` Defines a user defined callback. The last argument is a default function or `false`.

`call_callback luatexbase.call_callback($\langle name \rangle$, ...)` Calls a user defined callback with the supplied arguments.

5 Implementation

```

1  {*2ekernel | tex | latexrelease}
2  {2ekernel | latexrelease}\ifx\directlua\@undefined\else

```

5.1 Minimum LaTeX version

LaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```

3  \iflatexrelease\IncludeInRelease{2015/10/01}
4  \iflatexrelease\newluafunction{LuaTeX}%
5  \ifnum\luatexversion<60 %
6  \wlog{*****}
7  \wlog{* LaTeX version too old for ltluatex support *}
8  \wlog{*****}
9  \expandafter\endinput
10 \fi

```

Two simple LaTeX macros from `ltdefns.dtx` have to be defined here because `ltdefns.dtx` is not loaded yet when `ltluatex.dtx` is executed.

```

11 \long\def\@gobble#1{}
12 \long\def\@firstofone#1{#1}

```

5.2 Older LaTeX/Plain TeX setup

```
13 {*}tex
```

Older LaTeX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```

14 \directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}
15 \ifx\@alloc\@undefined

```

In pre-2014 LaTeX, or plain TeX, load `etex.{sty,src}`.

```

16 \ifx\documentclass\@undefined
17 \ifx\loccount\@undefined

```

```

18      \input{etex.src}%
19      \fi
20      \catcode`@=11 %
21      \outer\expandafter\def\csname newfam\endcsname
22          {\alloc@8\fam\chardef\et@xmaxfam}
23      \else
24          \RequirePackage{etex}
25          \expandafter\def\csname newfam\endcsname
26              {\alloc@8\fam\chardef\et@xmaxfam}
27          \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
28      \fi

```

5.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to `etex.src` which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX.

2015-07-13 higher range in luatex.

```

29 \edef \et@xmaxregs {\ifx\directlua\undefined 32768\else 65536\fi}
luatex/xetex also allow more math fam.

30 \edef \et@xmaxfam {\ifx\Umathcode\undefined\sixt@@n\else\@cclvi\fi}

31 \count 270=\et@xmaxregs % locally allocates \count registers
32 \count 271=\et@xmaxregs % ditto for \dimen registers
33 \count 272=\et@xmaxregs % ditto for \skip registers
34 \count 273=\et@xmaxregs % ditto for \muskip registers
35 \count 274=\et@xmaxregs % ditto for \box registers
36 \count 275=\et@xmaxregs % ditto for \toks registers
37 \count 276=\et@xmaxregs % ditto for \marks classes

```

and 256 or 16 fam. (Done above due to plain/L^AT_EX differences in l_tluatex.)

```

38 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}

```

End of proposed changes to `etex.src`

5.2.2 luatex specific settings

Switch to global cf `luatex.sty` to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

39 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
40             \csname globcount\endcsname
41 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
42             \csname globdimen\endcsname
43 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
44             \csname globskip\endcsname
45 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
46             \csname globbox\endcsname

```

Define `\e@alloc` as in latex (the existing macros in `etex.src` hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```

47 \chardef\e@alloc@top=65535
48 \let\e@alloc\chardef\chardef

```

```

49 \def\@alloc#1#2#3#4#5#6{%
50   \global\advance#3\@ne
51   \e@ch@ck{#3}{#4}{#5}#1%
52   \allocationnumber#3\relax
53   \global#2#6\allocationnumber
54   \wlog{\string#6=\string#1\the\allocationnumber}%
55 \gdef\@ch@ck#1#2#3#4{%
56   \ifnum#1<#2\else
57     \ifnum#1=#2\relax
58       #1\@ccclvi
59       \ifx\count#4\advance#1 10 \fi
60     \fi
61   \ifnum#1<#3\relax
62   \else
63     \errmessage{No room for a new \string#4}%
64   \fi
65 \fi}%

```

Fix up allocations not to clash with `etex.src`.

```

66 \expandafter\csname newcount\endcsname\@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\@alloc@luachunk@count

```

End of conditional setup for plain TeX / old L^AT_EX.

```

72 \fi
73 
```

5.3 Attributes

`\newattribute` As is generally the case for the LuaTeX registers we start here from 1. Notably, some code assumes that `\attribute0` is never used so this is important in this case.

```

74 \ifx\@alloc@attribute@count\@undefined
75   \countdef\@alloc@attribute@count=258
76   \@alloc@attribute@count=\z@
77 \fi
78 \def\newattribute#1{%
79   \@alloc@attribute\@attributedef
80   \@alloc@attribute@count\m@ne\@alloc@top#1%
81 }

```

(End definition for `\newattribute`.)

`\setattribute` Handy utilities.

```

82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

```

(End definition for `\setattribute` and `\unsetattribute`.)

5.4 Category code tables

- \newcatcodetable Category code tables are allocated with a limit half of that used by LuaTeX for everything else. At the end of allocation there needs to be an initialization step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```

84 \ifx\@alloc@ccodetable@count\@undefined
85   \countdef\@alloc@ccodetable@count=259
86   \e@alloc@ccodetable@count=\z@
87 \fi
88 \def\newcatcodetable#1{%
89   \e@alloc@catcodetable\chardef
90     \e@alloc@ccodetable@count\m@ne{"8000}#1%
91   \initcatcodetable\allocationnumber
92 }

```

(End definition for \newcatcodetable.)

- \catcodetable@initex \catcodetable@string \catcodetable@latex \catcodetable@atletter Save a small set of standard tables. The Unicode data is read here in using a parser simplified from that in load-unicode-data: only the nature of letters needs to be detected.

```

93 \newcatcodetable\catcodetable@initex
94 \newcatcodetable\catcodetable@string
95 \begingroup
96 \def\setrangepatcode#1#2#3{%
97   \ifnum#1>#2 %
98     \expandafter\@gobble
99   \else
100     \expandafter\@firstofone
101   \fi
102   {%
103     \catcode#1=#3 %
104     \expandafter\setrangepatcode\expandafter

163     \fi
164 \repeat
165 \closein\unicoderead
166 \firstofone{%
167     \catcode64=12 %
168     \savecatcodetable\catcodetable@latex
169     \catcode64=11 %
170     \savecatcodetable\catcodetable@atletter
171 }
172 \endgroup

```

(End definition for `\catcodetable@initex` and others.)

5.5 Named Lua functions

`\newluafunction` Much the same story for allocating LuaTeX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

173 \ifx\@alloc@luafunction\@undefined

```

174   \countdef\e@alloc@luafunction@count=260
175   \e@alloc@luafunction@count=\z@
176 \fi
177 \def\newluafunction{%
178   \e@alloc@luafunction\e@alloc@chardef
179   \e@alloc@luafunction@count\m@ne\e@alloc@top
180 }

```

(End definition for \newluafunction.)

\newluacmd Additionally two variants are provided to make the passed control sequence call the function directly.

```

181 \def\newluacmd{%
182   \e@alloc@luafunction\luadef
183   \e@alloc@luafunction@count\m@ne\e@alloc@top
184 }
185 \def\newprotectedluacmd{%
186   \e@alloc@luafunction{\protected\luadef}
187   \e@alloc@luafunction@count\m@ne\e@alloc@top
188 }

```

(End definition for \newluacmd and \newprotectedluacmd.)

5.6 Custom whatsits

\newwhatsit These are only settable from Lua but for consistency are definable here.

```

189 \ifx\e@alloc@whatsit@count\@undefined
190   \countdef\e@alloc@whatsit@count=261
191   \e@alloc@whatsit@count=\z@
192 \fi
193 \def\newwhatsit#1{%
194   \e@alloc@whatsit\e@alloc@chardef
195   \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
196 }

```

(End definition for \newwhatsit.)

5.7 Lua bytecode registers

\newluabytecode These are only settable from Lua but for consistency are definable here.

```

197 \ifx\e@alloc@bytecode@count\@undefined
198   \countdef\e@alloc@bytecode@count=262
199   \e@alloc@bytecode@count=\z@
200 \fi
201 \def\newluabytecode#1{%
202   \e@alloc@luabytecode\e@alloc@chardef
203   \e@alloc@bytecode@count\m@ne\e@alloc@top#1%
204 }

```

(End definition for \newluabytecode.)

5.8 Lua chunk registers

\newluachunkname As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```

205 \ifx\@alloc@luachunk@count\@undefined
206   \countdef\@alloc@luachunk@count=263
207   \@alloc@luachunk@count=\z@
208 \fi
209 \def\newluachunkname#1{%
210   \@alloc@luachunk\@alloc@chardef
211   \@alloc@luachunk@count\m@ne\@alloc@top#1%
212   {\escapechar\m@ne
213   \directlua{lua.name[\the\allocationnumber]="\string#1"}%}
214 }

```

(End definition for `\newluachunkname`.)

5.9 Lua loader

Lua code loaded in the format often has to be loaded again at the beginning of every job, so we define a helper which allows us to avoid duplicated code:

```

215 \def\now@and@everyjob#1{%
216   \everyjob\expandafter{\the\everyjob
217   #1%
218 }%
219 #1%
220 }

```

Load the Lua code at the start of every job. For the conversion of T_EX into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```

221 <2ekernel>\now@and@everyjob{%
222   \begingroup
223   \attributedef\attributezero=0 %
224   \chardef\charzero=0 %

```

Note name change required on older luatex, for hash table access.

```

225   \countdef\CountZero=0 %
226   \dimendef\dimenzero=0 %
227   \mathchardef\mathcharzero=0 %
228   \muskipdef\muskipzero=0 %
229   \skipdef\skipzero=0 %
230   \toksdef\tokszero=0 %
231   \directlua{require("ltluatex")}
232   \endgroup
233 <2ekernel>

286 〈/2ekernel | tex | latexrelease〉

```

5.10 Lua module preliminaries

287 〈*lua〉

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase Set up the table for the returned functions. This is used to expose all of the public functions.

```
288 luatexbase      = luatexbase or { }
289 local luatexbase = luatexbase
```

(*End definition for luatexbase.*)

Some Lua best practice: use local versions of functions where possible.

```
290 local string_gsub      = string.gsub
291 local tex_count         = tex.count
292 local tex_setattribute = tex.setattribute
293 local tex_setcount      = tex.setcount
294 local texio_write_nl   = texio.write_nl
295 local flush_list        = node.flush_list

296 local luatexbase_warning
297 local luatexbase_error
```

5.11 Lua module utilities

5.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```
298 local modules = modules or { }
```

(*End definition for modules.*)

provides_module Local function to write to the log.

```
299 local function luatexbase_log(text)
300   texio_write_nl("log", text)
301 end
```

Modelled on \ProvidesPackage, we store much the same information but with a little more structure.

```
302 local function provides_module(info)
303   if not (info and info.name) then
304     luatexbase_error("Missing module name for provides_module")
305   end
306   local function spaced(text)
307     return text and (" " .. text) or ""
308   end
309   luatexbase_log(
310     "Lua module: " .. info.name
311     .. spaced(info.date)
312     .. spaced(info.version)
313     .. spaced(info.description)
314   )
315   modules[info.name] = info
316 end
317 luatexbase.provides_module = provides_module
```

(*End definition for provides_module.*)

5.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from TeX. For errors we have to make some changes. Here we give the text of the error in the L^AT_EX format then force an error from Lua to halt the run. Splitting the message text is done using \n which takes the place of \MessageBreak.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```

318 local function msg_format(mod, msg_type, text)
319   local leader = ""
320   local cont
321   local first_head
322   if mod == "LaTeX" then
323     cont = string.gsub(leader, ".", " ")
324     first_head = leader .. "LaTeX: "
325   else
326     first_head = leader .. "Module " .. msg_type
327     cont = "(" .. mod .. ")"
328     .. string.gsub(first_head, ".", " ")
329     first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":" ..
330   end
331   if msg_type == "Error" then
332     first_head = "\n" .. first_head
333   end
334   if string.sub(text,-1) ~= "\n" then
335     text = text .. " "
336   end
337   return first_head .. " "
338   .. string.gsub(
339     text
340   .. "on input line "
341     .. tex.inputlineno, "\n", "\n" .. cont .. " "
342   )
343   .. "\n"
344 end

```

`module_info` Write messages.

```

module_warning 345 local function module_info(mod, text)
module_error    346   texio_write_nl("log", msg_format(mod, "Info", text))
347 end
348 luatexbase.module_info = module_info
349 local function module_warning(mod, text)
350   texio_write_nl("term and log", msg_format(mod, "Warning", text))
351 end
352 luatexbase.module_warning = module_warning
353 local function module_error(mod, text)
354   error(msg_format(mod, "Error", text))
355 end
356 luatexbase.module_error = module_error

```

(End definition for `module_info`, `module_warning`, and `module_error`.)

Dedicated versions for the rest of the code here.

```

357 function luatexbase_warning(text)
358     module_warning("luatexbase", text)
359 end
360 function luatexbase_error(text)
361     module_error("luatexbase", text)
362 end

```

5.12 Accessing register numbers from Lua

Collect up the data from the \TeX level into a Lua table: from version 0.80, $\text{Lua}\text{\TeX}$ makes that easy.

```

363 local luaregisterbasetable = { }
364 local registermap = {
365     attributezero = "assign_attr"      ,
366     charzero     = "char_given"       ,
367     CountZero    = "assign_int"       ,
368     dimenzero   = "assign_dimen"      ,
369     mathcharzero = "math_given"       ,
370     muskipzero  = "assign_mu_skip"   ,
371     skipzero    = "assign_skip"      ,
372     tokszero   = "assign_toks"       ,
373 }
374 local createtoken
375 if tex.luatexversion > 81 then
376     createtoken = token.create
377 elseif tex.luatexversion > 79 then
378     createtoken = newtoken.create
379 end
380 local hashtokens = tex.hashtokens()
381 local luatexversion = tex.luatexversion
382 for i,j in pairs (registermap) do
383     if luatexversion < 80 then
384         luaregisterbasetable[hashtokens[i][1]] =
385             hashtokens[i][2]
386     else
387         luaregisterbasetable[j] = createtoken(i).mode
388     end
389 end

```

`registernumber` Working out the correct return value can be done in two ways. For older $\text{Lua}\text{\TeX}$ releases it has to be extracted from the `hashtokens`. On the other hand, newer $\text{Lua}\text{\TeX}$'s have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

390 local registernumber
391 if luatexversion < 80 then
392     function registernumber(name)
393         local nt = hashtokens[name]
394         if(nt and luaregisterbasetable[nt[1]]) then
395             return nt[2] - luaregisterbasetable[nt[1]]
396         else
397             return false
398         end
399     end

```

```

400 else
401     function registernumber(name)
402         local nt = createtoken(name)
403         if(luaregisterbasetable[nt.cmdname]) then
404             return nt.mode - luaregisterbasetable[nt.cmdname]
405         else
406             return false
407         end
408     end
409 end
410 luatexbase.registernumber = registernumber

```

(End definition for registernumber.)

5.13 Attribute allocation

`new_attribute` As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

411 local attributes=setmetatable(
412 {}, {
413     __index = function(t,key)
414         return registernumber(key) or nil
415     end}
416 )
417 )
418 luatexbase.attributes = attributes

419 local attribute_count_name =
420         attribute_count_name or "e@alloc@attribute@count"
421 local function new_attribute(name)
422     tex_setcount("global", attribute_count_name,
423                 tex_count[attribute_count_name] + 1)
424     if tex_count[attribute_count_name] > 65534 then
425         luatexbase_error("No room for a new \\attribute")
426     end
427     attributes[name]= tex_count[attribute_count_name]
428     luatexbase_log("Lua-only attribute " .. name .. " = " ..
429                     tex_count[attribute_count_name])
430     return tex_count[attribute_count_name]
431 end
432 luatexbase.new_attribute = new_attribute

```

(End definition for new_attribute.)

5.14 Custom whatsit allocation

`new_whatsit` Much the same as for attribute allocation in Lua.

```

433 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"
434 local function new_whatsit(name)
435     tex_setcount("global", whatsit_count_name,
436                 tex_count[whatsit_count_name] + 1)
437     if tex_count[whatsit_count_name] > 65534 then
438         luatexbase_error("No room for a new custom whatsit")
439     end
440     luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..

```

```

441             tex_count[whatsit_count_name])
442     return tex_count[whatsit_count_name]
443   end
444 luatexbase.new_whatsit = new_whatsit

```

(End definition for `new_whatsit`.)

5.15 Bytecode register allocation

`new_bytecode` Much the same as for attribute allocation in Lua. The optional $\langle name \rangle$ argument is used in the log if given.

```

445 local bytecode_count_name =
446           bytecode_count_name or "e@alloc@bytecode@count"
447 local function new_bytecode(name)
448   tex_setcount("global", bytecode_count_name,
449               tex_count[bytecode_count_name] + 1)
450   if tex_count[bytecode_count_name] > 65534 then
451     luatexbase_error("No room for a new bytecode register")
452   end
453   luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
454                 tex_count[bytecode_count_name])
455   return tex_count[bytecode_count_name]
456 end
457 luatexbase.new_bytecode = new_bytecode

```

(End definition for `new_bytecode`.)

5.16 Lua chunk name allocation

`new_chunkname` As for bytecode registers but also store the name in the `lua.name` table.

```

458 local chunkname_count_name =
459           chunkname_count_name or "e@alloc@luachunk@count"
460 local function new_chunkname(name)
461   tex_setcount("global", chunkname_count_name,
462               tex_count[chunkname_count_name] + 1)
463   local chunkname_count = tex_count[chunkname_count_name]
464   chunkname_count = chunkname_count + 1
465   if chunkname_count > 65534 then
466     luatexbase_error("No room for a new chunkname")
467   end
468   lua.name[chunkname_count]=name
469   luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
470                 chunkname_count .. "\n")
471   return chunkname_count
472 end
473 luatexbase.new_chunkname = new_chunkname

```

(End definition for `new_chunkname`.)

5.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional `<name>` argument is used in the log if given.

```
474 local luafunction_count_name =
475           luafunction_count_name or "e@alloc@luafunction@count"
476 local function new_luafunction(name)
477   tex_setcount("global", luafunction_count_name,
478               tex_count[luafunction_count_name] + 1)
479   if tex_count[luafunction_count_name] > 65534 then
480     luatexbase_error("No room for a new luafunction register")
481   end
482   luatexbase_log("Lua function " .. (name or "") .. " = " ..
483                 tex_count[luafunction_count_name])
484   return tex_count[luafunction_count_name]
485 end
486 luatexbase.new_luafunction = new_luafunction
```

(End definition for `new_luafunction`.)

5.18 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

5.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

```
487 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```
488 local list, data, exclusive, simple, reverselist = 1, 2, 3, 4, 5
489 local types    = {
490   list      = list,
491   data      = data,
492   exclusive = exclusive,
493   simple    = simple,
494   reverselist = reverselist,
495 }
```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
\bye
```

in plain LuaTeX. (Some undocumented callbacks are omitted as they are to be removed.)

```
496 local callbacktypes = callbacktypes or {
```

Section 8.2: file discovery callbacks.

```
497   find_read_file      = exclusive,
498   find_write_file     = exclusive,
499   find_font_file      = data,
500   find_output_file    = data,
501   find_format_file    = data,
502   find_vf_file        = data,
503   find_map_file       = data,
504   find_enc_file       = data,
505   find_pk_file        = data,
506   find_data_file      = data,

509   find_type1_file     = data,
510   find_image_file     = data,
511
511   open_read_file      = exclusive,
512   read_font_file      = exclusive,
513   read_vf_file        = exclusive,
514   read_map_file       = exclusive,

518   read_truetype_file  = exclusive,
519   read_type1_file     = exclusive,
520   read_opentype_file  = exclusive,
```

574 }
575 luatexbase.callbacktypes=callbacktypes

```

`callback.register` Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```

576 local callback_register = callback_register or callback.register
577 function callback.register()
578   luatexbase_error("Attempt to use callback.register() directly\n")
579 end

```

(End definition for `callback.register`.)

5.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

simple is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of *data* for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except that for the following. If one function returns **false**, then **false** is immediately returned and the following functions are *not* called. If one function returns **true**, then the same head is passed to the next function. If all functions return **true**, then **true** is returned, otherwise the return value of the last function not returning **true** is used.

reverselist is a specialized variant of *list* which executes functions in inverse order.

exclusive is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered.

Handler for **data** callbacks.

```
580 local function data_handler(name)
581   return function(data, ...)
582     for _,i in ipairs(callbacklist[name]) do
583       data = i.func(data,...)
584     end
585     return data
586   end
587 end
```

Default for user-defined **data** callbacks without explicit default.

```
588 local function data_handler_default(value)
589   return value
590 end
```

Handler for **exclusive** callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
591 local function exclusive_handler(name)
592   return function(...)
593     return callbacklist[name][1].func(...)
594   end
595 end
```

Handler for list callbacks.

```
596 local function list_handler(name)
597     return function(head, ...)
598         local ret
599         for _,i in ipairs(callbacklist[name]) do
600             ret = i.func(head, ...)
601             if ret == false then
602                 luatexbase_warning(
603                     "Function '" .. i.description .. "' returned false\n"
604                     .. "in callback '" .. name .. "'"
605                 )
606             return false
607         end
608         if ret ~= true then
609             head = ret
610         end
611     end
612     return head
613 end
614 end
```

Default for user-defined list and reverselist callbacks without explicit default.

```
615 local function list_handler_default(head)
616     return head
617 end
```

Handler for reverselist callbacks.

```
618 local function reverselist_handler(name)
619     return function(head, ...)
620         local ret
621         local callbacks = callbacklist[name]
622         for i = #callbacks, 1, -1 do
623             local cb = callbacks[i]
624             ret = cb.func(head, ...)
625             if ret == false then
626                 luatexbase_warning(
627                     "Function '" .. cb.description .. "' returned false\n"
628                     .. "in callback '" .. name .. "'"
629                 )
630             return false
631         end
632         if ret ~= true then
633             head = ret
634         end
635     end
636     return head
637 end
638 end
```

Handler for simple callbacks.

```
639 local function simple_handler(name)
640     return function(...)
641         for _,i in ipairs(callbacklist[name]) do
642             i.func(...)
643         end
644     end
645 end
```

```

644     end
645 end
Default for user-defined simple callbacks without explicit default.
646 local function simple_handler_default()
647 end
Keep a handlers table for indexed access and a table with the corresponding default
functions.
648 local handlers = {
649     [data]      = data_handler,
650     [exclusive] = exclusive_handler,
651     [list]       = list_handler,
652     [reverselist] = reverselist_handler,
653     [simple]     = simple_handler,
654 }
655 local defaults = {
656     [data]      = data_handler_default,
657     [exclusive] = nil,
658     [list]       = list_handler_default,
659     [reverselist] = list_handler_default,
660     [simple]     = simple_handler_default,
661 }

```

5.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```

662 local user_callbacks_defaults = {
663     pre_mlist_to_hlist_filter = list_handler_default,
664     mlist_to_hlist = node.mlist_to_hlist,
665     post_mlist_to_hlist_filter = list_handler_default,
666 }

```

`create_callback` The allocator itself.

```

667 local function create_callback(name, ctype, default)
668     local ctype_id = types[ctype]
669     if not name or name == ""
670     or not ctype_id
671     then
672         luatexbase_error("Unable to create callback:\n" ..
673                         "valid callback name and type required")
674     end
675     if callbacktypes[name] then
676         luatexbase_error("Unable to create callback '" .. name ..
677                         "'\ncallback is already defined")
678     end
679     default = default or defaults[ctype_id]
680     if not default then
681         luatexbase_error("Unable to create callback '" .. name ..
682                         "'\ndefault is required for '" .. ctype ..
683                         "' callbacks")
684     elseif type (default) ~= "function" then

```

```

685     luatexbase_error("Unable to create callback '" .. name ..
686                             "':\\ndefault is not a function")
687   end
688   user_callbacks_defaults[name] = default
689   callbacktypes[name] = ctype_id
690 end
691 luatexbase.create_callback = create_callback
(End definition for create_callback.)
```

`call_callback` Call a user defined callback. First check arguments.

```

692 local function call_callback(name,...)
693   if not name or name == "" then
694     luatexbase_error("Unable to create callback:\\n" ..
695                           "valid callback name required")
696   end
697   if user_callbacks_defaults[name] == nil then
698     luatexbase_error("Unable to call callback '" .. name ..
699                           .. "'\\nunknown or empty")
700   end
701   local l = callbacklist[name]
702   local f
703   if not l then
704     f = user_callbacks_defaults[name]
705   else
706     f = handlers[callbacktypes[name]](name)
707   end
708   return f(...)
709 end
710 luatexbase.call_callback=call_callback
(End definition for call_callback.)
```

`add_to_callback` Add a function to a callback. First check arguments.

```

711 local function add_to_callback(name, func, description)
712   if not name or name == "" then
713     luatexbase_error("Unable to register callback:\\n" ..
714                           "valid callback name required")
715   end
716   if not callbacktypes[name] or
717     type(func) ~= "function" or
718     not description or
719     description == "" then
720     luatexbase_error(
721       "Unable to register callback.\\n\\n"
722       .. "Correct usage:\\n"
723       .. "add_to_callback(<callback>, <function>, <description>)"
724     )
725   end
```

Then test if this callback is already in use. If not, initialise its list and register the proper handler.

```

726   local l = callbacklist[name]
727   if l == nil then
728     l = { }
729     callbacklist[name] = l
```

If it is not a user defined callback use the primitive callback register.

```
730     if user_callbacks_defaults[name] == nil then
731         callback_register(name, handlers[callbacktypes[name]](name))
732     end
733 end
```

Actually register the function and give an error if more than one `exclusive` one is registered.

```
734     local f = {
735         func      = func,
736         description = description,
737     }
738     local priority = #l + 1
739     if callbacktypes[name] == exclusive then
740         if #l == 1 then
741             luatexbase_error(
742                 "Cannot add second callback to exclusive function\n" ..
743                 name .. "'")
744         end
745     end
746     table.insert(l, priority, f)
```

Keep user informed.

```
747     luatexbase_log(
748         "Inserting '" .. description .. "' at position "
749         .. priority .. " in '" .. name .. "'."
750     )
751 end
752 luatexbase.add_to_callback = add_to_callback
```

(End definition for `add_to_callback`.)

`remove_from_callback` Remove a function from a callback. First check arguments.

```
753 local function remove_from_callback(name, description)
754     if not name or name == "" then
755         luatexbase_error("Unable to remove function from callback:\n" ..
756                         "valid callback name required")

758     if not callbacktypes[name] or
759         not description or
760         description == "" then
761         luatexbase_error(
762             "Unable to remove function from callback.\n\n"
763             .. "Correct usage:\n"
764             .. "remove_from_callback(<callback>, <description>)"
765         )
766     end
767     local l = callbacklist[name]
768     if not l then
769         luatexbase_error(
770             "No callback list for '" .. name .. "'\n")
771     end
```

Loop over the callback's function list until we find a matching entry. Remove it and check if the list is empty: if so, unregister the callback handler.

```

772 local index = false
773 for i,j in ipairs(l) do
774   if j.description == description then
775     index = i
776     break
777   end
778 end
779 if not index then
780   luatexbase_error(
781     "No callback \" .. description .. \" registered for \" ..
782     name .. \"\n")
783 end
784 local cb = l[index]
785 table.remove(l, index)
786 luatexbase_log(
787   "Removing \" .. description .. \" from \" .. name .. \"."
788 )
789 if #l == 0 then
790   callbacklist[name] = nil
791   if user_callbacks_defaults[name] == nil then
792     callback_register(name, nil)
793   end
794 end
795 return cb.func,cb.description
796 end
797 luatexbase.remove_from_callback = remove_from_callback

```

(End definition for `remove_from_callback`.)

`in_callback` Look for a function description in a callback.

```

798 local function in_callback(name, description)
799   if not name
800     or name == ""
801     or not callbacklist[name]
802     or not callbacktypes[name]
803     or not description then
804       return false
805     end
806   for _, i in pairs(callbacklist[name]) do
807     if i.description == description then
808       return true
809     end
810   end
811   return false
812 end
813 luatexbase.in_callback = in_callback

```

(End definition for `in_callback`.)

`disable_callback` As we subvert the engine interface we need to provide a way to access this functionality.

```

814 local function disable_callback(name)
815   if(callbacklist[name] == nil) then
816     callback_register(name, false)
817   else
818     luatexbase_error("Callback list for \" .. name .. \" not empty")

```

```

819     end
820   end
821 luatexbase.disable_callback = disable_callback
(End definition for disable_callback.)
```

callback_descriptions List the descriptions of functions registered for the given callback.

```

822 local function callback_descriptions (name)
823   local d = {}
824   if not name
825     or name == ""
826     or not callbacklist[name]
827     or not callbacktypes[name]
828   then
829     return d
830   else
831     for k, i in pairs(callbacklist[name]) do
832       d[k]= i.description
833     end
834   end
835   return d
836 end
837 luatexbase.callback_descriptions =callback_descriptions
```

(End definition for callback_descriptions.)

uninstall Unlike at the TeX level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```

838 local function uninstall()
839   module_info(
840     "luatexbase",
841     "Uninstalling kernel luatexbase code"
842   )
843   callback.register = callback_register
844   luatexbase = nil
845 end
846 luatexbase.uninstall = uninstall
```

(End definition for uninstall.)

mlist_to_hlist To emulate these callbacks, the “real” `mlist_to_hlist` is replaced by a wrapper calling the wrappers before and after.

```

847 callback_register("mlist_to_hlist", function(head, display_type, need_penalties)
848   local current = call_callback("pre_mlist_to_hlist_filter", head, display_type, need_penalties)
849   if current == false then
850     flush_list(head)
851     return nil
852   end
853   current = call_callback("mlist_to_hlist", current, display_type, need_penalties)
854   local post = call_callback("post_mlist_to_hlist_filter", current, display_type, need_penalties)
855   if post == false then
856     flush_list(current)
857     return nil
```

```
858     end
859     return post
860 end)

(End definition for mlist_to_hlist.)
```

861 ⟨/lua⟩

1 expl3-dependent code

1.1 Loader

\@kernel@after@enddocument
\@kernel@after@enddocument@afterlastpage

These two kernel hooks are used by the shipout code. They are defined earlier here because the lhooks code adds material to them.

```
1  {*2ekernel | latexrelease}
2  <{latexrelease}>\IncludeInRelease{2020/10/01}%
3  <{latexrelease}> {kernel@enddocument hooks}{Define several kernel hooks}
```

We only initialize these kernel hooks if they are not already existing. Otherwise they would be set to \empty on rollback which would be wrong because code that has been added to them may still have to be executed in the rollback situation. Instead code that writes to them needs to handle the rollback as needed. It is likely that we have to change that approach in the future, but for now it should do. (It is enough to test only for the existence of one hook, as all got added at the same time.)

```
4  \ifx\@kernel@after@enddocument\@undefined
5    \let\@kernel@after@enddocument\empty
6    \let\@kernel@after@enddocument@afterlastpage\empty
```

For the similar reasons we also define those that are used in \document because they too get material added to in early modules.

```
7  \let\@kernel@before@begindocument\empty
8  \let\@kernel@after@begindocument\empty
9  \fi
10 <{latexrelease}>\EndIncludeInRelease
11 <{latexrelease}>\IncludeInRelease{0000/00/00}%
12 <{latexrelease}> {kernel@enddocument hooks}{Define several kernel hooks}
13 <{latexrelease}>\let\@kernel@after@enddocument\@undefined
14 <{latexrelease}>\let\@kernel@after@enddocument@afterlastpage\@undefined
15 <{latexrelease}>\let\@kernel@before@begindocument\@undefined
16 <{latexrelease}>\let\@kernel@after@begindocument\@undefined
17 <{/2ekernel | latexrelease}>
18 <{latexrelease}>\EndIncludeInRelease
```

(End definition for \@kernel@after@enddocument and others.)

First define some blank commands, so that in case something goes wrong while loading expl3, we won't get strange Undefined control sequence errors.

```

```

1.2 Using `expl3` code

In order to ease the implementation of some new features in L^AT_EX 2 _{ε} we may (temporarily) use some coding based on the `expl3`-code. Such macros will eventually vanish and may be changed unannounced. They are there for internal use in the L^AT_EX 2 _{ε} kernel and are not meant to be used in third-party packages. These macros will always have the `@expl@` prefix in their name.

The rest of the name matches the `expl3` name but with all underscores replaced by @s and the : replaced by @@, e.g.,

```
\cs_new_eq:NN \@expl@tl@trim@spaces@apply@@nN \tl_trim_spaces_apply:nN
```

if that `expl3` command is needed in places that are others coded in L^AT_EX 2 _{ε} conventions.

In this file, each release of LaTeX adds an `\IncludeInRelease` block, in which the macros copied for that release were defined. In case a rollback is requested, the entire block is changed.

Each macro copied has a `\changes` entry to explain when and why it was copied, so that further to that may spot it easily.

Here `\cs_gset_eq:NN` is used, instead of the `new` variant because if different releases use that same name for different purposes, each can copy the macro without worrying about redefinitions.

```

133 〈latexrelease〉\IncludeInRelease{2020/10/01}{\@expl@cs@to@str@@N}%
134 〈latexrelease〉          {expl3 macros added for the 2020-10-01 release}%

```

The `expl3` activation needs to be inside the release guards as otherwise rolling forward is broken in old kernels that do not have `expl3` loaded.

```

135 \ExplSyntaxOn
136 \cs_gset_eq:NN \@expl@cs@to@str@@N \cs_to_str:N
137 \cs_gset_eq:NN \@expl@str@if@eq@nnTF \str_if_eq:nnTF

```

```

138 \cs_gset_eq:NN \expl@cs@prefix@spec@@N \cs_prefix_spec:N
139 \cs_gset_eq:NN \expl@cs@argument@spec@@N \cs_argument_spec:N
140 \cs_gset_eq:NN \expl@cs@replacement@spec@@N \cs_replacement_spec:N

141 \cs_gset_eq:NN \expl@str@map@function@@NN \str_map_function:NN
142 \cs_gset_eq:NN \expl@char@generate@@nn \char_generate:nn
143 \ExplSyntaxOff

```

Here we can't assume that `expl3` is available. It will be if we roll back but if this code is executed rolling forward it needs to be pure 2e.

```

144 <texrelease>\EndIncludeInRelease
145 <texrelease>\IncludeInRelease{0000/00/00}{\expl@cs@to@str@@N}%
146 <texrelease>           {expl3 macros added for the 2020-10-01 release}%

```

2 Document-level command names for `expl3` functions

Current home for L3 programming layer functions that we make directly available at the document level. This section may need to be moved later (after `\NewDocumentCommand` is defined in case we want to use that in the setup).

`\fpeval` The expandable command `\fpeval` takes as its argument a floating point expression and produces a result using the normal rules of mathematics. As this command is expandable it can be used where TeX requires a number and for example within a low-level `\edef` operation to give a purely numerical result. See `usrguide3` for further explanation.

`\inteval` The expandable command `\inteval` takes as its argument an integer expression and `\dimeval` produces a result using the normal rules of mathematics. The operations recognised are `\skipeval` +, -, *, and / plus parentheses. Division occurs with *rounding*, and ties are rounded away from zero. As this command is expandable it can be used where TeX requires a number and for example within a low-level `\edef` operation to give a purely numerical result. See `usrguide3` for further explanation. `\dimeval` and `\skipeval` are similar, but generate fixed and rubber length values, respectively.

`\fpeval` A document level wrapper around the code level function for floating point calculations.
`\inteval`
`\dimeval`
`\skipeval`

```

155 <2ekernel | texrelease>
156 <texrelease>\IncludeInRelease{2022/06/01}%
157 <texrelease>           {\fpeval}{fp and int calculations}%
158 \ExplSyntaxOn
159 \cs_new_eq:NN \fpeval \fp_eval:n

```

And a few more, this time wrappers around the eTeX primitives.

```

160 \cs_new_eq:NN \inteval \int_eval:n

```

```

161 \cs_new_eq:NN \dimeval \dim_eval:n
162 \cs_new_eq:NN \skipEval \skip_eval:n
163 \ExplSyntaxOff

(End definition for \fpeval and others.)

171 ⟨latexrelease⟩\let\dimeval\@undefined
172 ⟨latexrelease⟩\let\skipEval\@undefined
173 ⟨latexrelease⟩\EndIncludeInRelease

```

\UserName When declaring new commands with `\NewDocumentCommand` or `\NewCommandCopy` **\ExpandArgs** or similar, it is sometimes necessary to “construct” the csname. As a general mechanism the L3 programming layer has `\exp_args:N...` for this, but there is no mechanism for it if `\ExplSyntaxOn` is not active. We therefore offer a few of these commands also with CamelCase names.

\UserName A document wrapper for changing arguments to cs names for use with `\NewDocumentCommand` and similar functions.

```

174 ⟨*2ekernel | latexrelease⟩
175 ⟨latexrelease⟩\IncludeInRelease{2022/06/01}%

ltdefns.dtx

1 Definitions

This section contains commands used in defining other macros.

1 `(*2ekernel)`

1.1 Initex initializations

`\two@digits` Prefix a number less than 10 with ‘0’.

2 `\def\two@digits#1{\ifnum#1<10 0\fi\number#1}`

(*End definition for \two@digits.*)

`\typeout` Display something on the terminal.

3 `</2ekernel>`
4 `<*2ekernel | latexrelease>`
5 `<latexrelease>\IncludeInRelease{2020/10/01}%`
6 `<latexrelease> \typeout{\allow "par" in \typeout}%`
7 `\protected\long\def\typeout#1{\begingroup`
8 `\set@display@protect`
9 `\def\par{\^J}%`
10 `\immediate\write\@unused{#1}\endgroup}`
11 `</2ekernel | latexrelease>`
12 `<latexrelease>\EndIncludeInRelease`
13 `<latexrelease>\IncludeInRelease{0000/00/00}%`
14 `<latexrelease> \typeout{\allow "par" in \typeout}%`
15 `<latexrelease>`
16 `<latexrelease>\def\typeout#1{\begingroup\set@display@protect`
17 `\immediate\write\@unused{#1}\endgroup}`
18 `<latexrelease>\EndIncludeInRelease`
19 `(*2ekernel)`

(*End definition for \typeout.*)

`\newlinechar` A char to be used as new-line in output to files.

20 `\newlinechar`\^J`

(*End definition for \newlinechar.*)

1.2 Saved versions of TeX primitives

The TeX primitive `\foo` is saved as `\@@foo`. The following primitives are handled in this way:

`\@@par`

21 `\let\@@par=\par`
22 `%\let\@@input=\input %% moved earlier`
23 `%\let\@@end=\end %%`

(*End definition for \@@par.*)

\@@hyph Save original primitive definition.
²⁴ \let\@@hyph=\-
(End definition for \@@hyph.)

\@@italiccorr Save the original italic correction.
²⁵ \let\@@italiccorr=\/
(End definition for \@@italiccorr.)

\@height The following definitions save token space. E.g., using \@height instead of height saves
\@depth 5 tokens at the cost in time of one macro expansion.
\@width ²⁶ \def\@height{height} \def\@depth{depth} \def\@width{width}
\@minus ²⁷ \def\@minus{minus}
\@plus ²⁸ \def\@plus{plus}

The next one is another 100 tokens worth.
²⁹ \def\hb@xt@{\hbox to}
(End definition for \@height and others.)
³⁰ \message{hacks,}
\hb@xt@

1.3 Command definitions

This section defines the following commands:

\@namedef {\{NAME\}}
Expands to \def{\{NAME\}}, except name can contain any characters.

\@nameuse {\{NAME\}}
Expands to \{\{NAME\}\}.

\@ifnextchar X{\{YES\}}{\{NO\}}
Expands to \{YES\} if next character is an 'X', and to \{NO\} otherwise. (Uses \reserved@a-\reserved@c.) NOTE: GOBBLES ANY SPACE FOLLOWING IT.

\@ifstar {\{YES\}}{\{NO\}}
Gobbles following spaces and then tests if next the character is a '*'. If it is, then it gobbles the '*' and expands to \{YES\}, otherwise it expands to \{NO\}.

\@dblarg {\{CMD\}}{\{ARG\}}
Expands to \{\{CMD\}\}[\{ARG\}]\{\{ARG\}\}. Use \@dblarg\CS when \CS takes arguments [ARG1]\{ARG2\}, where default is ARG1 = ARG2.

\@ifundefined {\{NAME\}}{\{YES\}}{\{NO\}}
: If \NAME is undefined then it executes \{YES\}, otherwise it executes \{NO\}. More precisely, true if \NAME either undefined or = \relax.

\@ifdefinable {\{NAME\}}{\{YES\}} Executes \{YES\} if the user is allowed to define \NAME, otherwise it gives an error. The user can define \NAME if \@ifundefined{\NAME} is true, '\NAME' ≠ 'relax' and the first three letters of '\NAME' are not 'end', and if \endNAME is not defined.

\newcommand *{\{FOO\}}[{\{i\}}]{\{TEXT\}}
User command to define \FOO to be a macro with i arguments (i = 0 if missing) having the definition \{TEXT\}. Produces an error if \FOO already defined.

Normally the command is defined to be \long (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as \long and a blank line in any argument to the command would generate an error.

\renewcommand *{\{FOO\}}[{\{i\}}]{\{TEXT\}}

Same as `\newcommand`, except it checks if `\FOO` already defined.
`\newenvironment` $*\{FOO\}[\langle i \rangle]\{\langle DEF1 \rangle\}\{\langle DEF2 \rangle\}$
 equivalent to:
`\newcommand{\FOO}[i]{\def{\endFOO}{DEF2}}`
 (or the appropriate star forms).

`\renewenvironment` Obvious companion to `\newenvironment`.
`\@cons` : See description of `\output` routine.
`\@car` $\@car T_1 T_2 \dots T_n \@nil == T_1$ (unexpanded)
`\@cdr` $\@cdr T_1 T_2 \dots T_n \@nil == T_2 \dots T_n$ (unexpanded)
`\typeout` $\{\langle message \rangle\}$
 Produces a warning message on the terminal.
`\typein` $\{\langle message \rangle\}$
 Types message, asks the user to type in a command, then executes it
`\typein` $[(\text{\texttt{CS}})]\{\langle MSG \rangle\}$
 Same as above, except defines `\text{\texttt{CS}}` to be the input instead of executing it.

`\typein`

```

31 \def\typein{%
32   \let\@typein\relax
33   \@testopt\@xtypein\@typein}

34 \ifx\directlua\undefined
35 \def\@xtypein[#1]#2{%
36   \typeout{#2}%
37   \advance\endlinechar\@M
38   \read\@inputcheck to#1%
39   \advance\endlinechar-\@M
40   \@typein}%

41 \else
42 \def\@xtypein[#1]#2{%
43   \typeout{#2}%
44   \begingroup \endlinechar\m@ne
45   \read\@inputcheck to#1%
46   \expandafter\endgroup
47   \expandafter\def\expandafter#1\expandafter{#1}%
48   \@typein}%

49 \fi

```

(End definition for `\typein`.)

`\@namedef`

```

50 \def\@namedef#1{\expandafter\def\csname #1\endcsname}

```

(End definition for `\@namedef`.)

`\@nameuse`

```

51 \def\@nameuse#1{\csname #1\endcsname}

```

(End definition for `\@nameuse`.)

```

\@cons
52 \def\@cons#1#2{\begingroup\let\@elt\relax\xdef#1{#1\@elt #2}\endgroup}
(End definition for \@cons.)

\@car
\@cdr 53 \def\@car#1#2\@nil{#1}
54 \def\@cdr#1#2\@nil{#2}

(End definition for \@car and \@cdr.)

\@carcube \@carcube T1 ... Tn\@nil = T1 T2 T3 , n > 3
55 ⟨/2ekernel⟩
56 ⟨latexrelease⟩\IncludeInRelease{2020/10/01}{\@carcube}{Make \@carcube long}%
57 ⟨*2ekernel | latexrelease⟩
58 \long\def\@carcube#1#2#3#4\@nil{#1#2#3}
59 ⟨/2ekernel | latexrelease⟩
60 ⟨latexrelease⟩\EndIncludeInRelease
61 %
62 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}{\@carcube}{Undo: Make \@carcube long}%
63 ⟨latexrelease⟩\def\@carcube#1#2#3#4\@nil{#1#2#3}
64 ⟨latexrelease⟩\EndIncludeInRelease
65 ⟨*2ekernel⟩

(End definition for \@carcube.)

\@onlypreamble \@preamblecmds This macro adds its argument to the list of commands stored in \@preamblecmds to be disabled after \begin{document}. These commands are redefined to generate \@notprerr at this point.
66 \def\@preamblecmds{}
67 \def\@onlypreamble#1{%
68   \expandafter\gdef\expandafter\@preamblecmds\expandafter{%
69     \@preamblecmds\do#1}%
70 \@onlypreamble\@onlypreamble
71 \@onlypreamble\@preamblecmds

(End definition for \@onlypreamble and \@preamblecmds.)

\@star@or@long Look ahead for a *. If present reset \l@ngrel@x so that the next definition, #1, will be non-long.
72 \def\@star@or@long#1{%
73   \@ifstar
74   {\let\l@ngrel@x\relax#1}%
75   {\let\l@ngrel@x\long#1}}

(End definition for \@star@or@long.)

\l@ngrel@x This is either \relax or \long depending on whether the *-form of a definition command is being executed.
76 \let\l@ngrel@x\relax

(End definition for \l@ngrel@x.)

\newcommand User level \newcommand.
77 \def\newcommand{\@star@or@long\new@command}

```

```

\new@command 78 \def\new@command#1{%
79   @testopt{\@newcommand#1}0}

(End definition for \newcommand and \new@command.)

```

\@newcommand Handling arguments for \newcommand.
 \@argdef 80 \def\@newcommand#1[#2]{%
 \@xargdef 81 \kernel@ifnextchar [{\@argdef#1[#2]}{%
 82 {\@argdef#1[#2]}}}

Define #1 if it is definable.

Both here and in \@xargdef the replacement text is absorbed as an argument because if we are not allowed to make the definition we have to get rid of it completely.

```

83 \long\def\@argdef#1[#2]#3{%
84   \@ifdefinable #1{\@yargdef#1\@ne{#2}{#3}}}

```

Handle the second optional argument.

```

85 \long\def\@xargdef#1[#2][#3]#4{%
86   \@ifdefinable#1{%

```

Define the actual command to be:

```
\def\foo{\@protected@testopt\foo\\foo{default}}
```

where \\foo is a csname generated from applying \csname and \string to \foo, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of (re)newcommand.

```

87   \expandafter\def\expandafter#1\expandafter{%
88     \expandafter
89     \@protected@testopt
90     \expandafter
91     #1%
92     \csname\string#1\endcsname
93     {#3}}%

```

Now we define the internal macro ie \\foo which is supposed to pick up all arguments (optional and mandatory).

```

94   \expandafter\@yargdef
95     \csname\string#1\endcsname
96     \tw@
97     {#2}%
98     {#4}}}}

```

(End definition for \@newcommand, \@argdef, and \@xargdef.)

\@testopt This macro encapsulates the most common call to \@ifnextchar, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [need not be a single token but can be any sequence of commands that 'expects' to be followed by [. If this command were only used in \newcommand definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```

99 \long\def\@testopt#1#2{%
100  \kernel@ifnextchar[{#1}{#1[{#2}]}}}

```

(End definition for \@testopt.)

\@protected@testopt Robust version of \@testopt. The extra argument (#1) must be a single token. If protection is needed the call expands to \protect applied to this token, and the 2nd and 3rd arguments are discarded (by \cx@protect). Otherwise \@testopt is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the \ifx test.

```

101 \def\@protected@testopt#1{%
102   \ifx\protect\@typeset@protect
103     \expandafter\@testopt
104   \else
105     \c@x@protect#1%
106   \fi}

```

(End definition for \@protected@testopt.)

\@yargdef These generate a primitive argument specification, from a L^AT_EX [*digit*] form; in fact *digit* can be anything such that \number*digit* is single digit.

Reorganised slightly so that \renewcommand{\reserved@a}[1]{foo} works. I am not sure this is worth it, as a following \newcommand would over-write the definition of \reserved@a.

Recall that L^AT_EX2.09 goes into an infinite loop with
\renewcommand[1]{\@tempa}{foo}
(DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using #2 = \tw@ as the flag to surround the first argument with []). But the new method did not allow for the number of arguments #3 not being given as an explicit digit; hence (further expansion of this argument and use of) \number was added later in 1999.

It is not clear why these are still \long.

```

107 \long \def \@yargdef #1#2#3{%
108   \ifx#2\tw@
109     \def\reserved@b##1{####1}%
110   \else
111     \let\reserved@b\@gobble
112   \fi
113   \expandafter
114     \@yargd@f \expandafter{\number #3}#1%
115 }

116 \long \def \@yargd@f#1#2{%
117   \def \reserved@a ##1##2##{%
118     \expandafter\def\expandafter#2\reserved@b ##1##
119   }%
120   \l@ngrel@x \reserved@a 0##1##2##3##4##5##6##7##8##9##1%
121 }

```

(End definition for \@yargdef and \@yargd@f.)

\@reargdef

```

122 \long\def\@reargdef#1[#2]{%
123   \@yargdef#1\@ne{#2}}

```

(End definition for \creargdef.)

- \renewcommand Check the command name is already used. If not give an error message. Then temporarily disable \@ifdefinable then call \newcommand. (Previous version \let#1=\relax but this does not work too well if #1 is \tempa-e.)

124 \def\renewcommand{\@star@or@long\renew@command}

```
125 \def\renew@command#1{%
126   \begingroup \escapechar`m@ne\xdef\@gtempa{{\string#1}}\endgroup
127   \expandafter\@ifundefined\@gtempa
128     {\@latex@error{Command \string#1 undefined}\@ehc}%
129     \relax
130   \let\@ifdefinable\@rc@ifdefinable
131   \new@command#1}
```

(End definition for \renewcommand and \renew@command.)

- \@ifdefinable Test if user is allowed to define a command.

```
132 \long\def\@ifdefinable #1#2{%
133   \edef\reserved@a{\expandafter\@gobble\string #1}%
134   \@ifundefined\reserved@a
135     {\edef\reserved@b{\expandafter\@carcube \reserved@a xxx\@nil}%
136      \ifx \reserved@b\@qend \@notdefinable\else
137        \ifx \reserved@a\@qrelax \@notdefinable\else
138          #2%
139        \fi
140      \fi}%
141    \@notdefinable}
```

Saved definition of \@ifdefinable.

142 \let\@@ifdefinable\@ifdefinable

Version of \@ifdefinable for use with \renewcommand. Does not do the check this time, but restores the normal definition.

```
143 \long\def\@rc@ifdefinable#1#2{%
144   \let\@ifdefinable\@@ifdefinable
145   #2}
```

(End definition for \@ifdefinable, \@@ifdefinable, and \@rc@ifdefinable.)

- \newenvironment Define a new user environment. #1 is the environment name. #2# Grabs all the tokens up to the first {. These will be any optional arguments. They are not parsed at this point, but are just passed to \@newenv which will eventually call \newcommand. Any optional arguments will then be parsed by \newcommand as it defines the command that executes the ‘begin code’ of the environment.

This #2# trick removed with version 1.2i as it fails if a { occurs in the optional argument. Now use \@ifnextchar directly.

146 \def\newenvironment{\@star@or@long\new@environment}

```
147 \def\new@environment#1{%
148   \@testopt{\@newenva#1}0}
```

```

149 \def\@newenva#1[#2]{%
150     \kernel@ifnextchar [{\@newenvb#1[#2]}{\@newenv{#1}{[#2]}}}

151 \def\@newenvb#1[#2][#3]{\@newenv{#1}{[#2][[#3]]}}
(End definition for \newenvironment and others.)

\renewenvironment Redefine an environment. For \renewenvironment disable \ifdefinable and then call
\newenvironment. It is OK to \let the argument to \relax here as there should not
be a @temp... environment.
152 \def\renewenvironment{\@star@or@long\renew@environment}

\renew@environment
153 \def\renew@environment#1{%
154     \@ifundefined{#1}%
155         {\@latex@error{Environment #1 undefined}\@ehc
156             }\relax
157     \expandafter\let\csname#1\endcsname\relax
158     \expandafter\let\csname end#1\endcsname\relax
159     \new@environment{#1}}
(End definition for \renewenvironment and \renew@environment.)

\@newenv The internal version of \newenvironment.
Call \newcommand to define the <begin-code> for the environment. \def is used for
the <end-code> as it does not take arguments. (but may contain \pars)
Make sure that an attempt to define a ‘graf’ or ‘group’ environment fails.
160 \long\def\@newenv#1#2#3#4{%
161     \@ifundefined{#1}%
162         {\expandafter\let\csname#1\expandafter\endcsname
163             \csname end#1\endcsname}%
164     \relax
165     \expandafter\new@command
166         \csname #1\endcsname#2{#3}%
167         \l@ngrel@x\expandafter\def\csname end#1\endcsname{#4}}
(End definition for \@newenv.)

\newif And here’s a different sort of allocation: For example, \newif\iff foo creates \foottrue,
\foofalse to go with \iff foo.
168 \def\newif#1{%
169     \count@\escapechar \escapechar\m@ne
170     \let#1\iffalse
171     \@if#1\iftrue
172     \@if#1\iffalse
173     \escapechar\count@}

\@if
174 \def\@if#1#2{%
175     \expandafter\def\csname\expandafter\@gobbletwo\string#1%
176         \expandafter\@gobbletwo\string#2\endcsname
177         {\let#1#2}}

```

(End definition for \newif and \@if.)

\providecommand \providecommand takes the same arguments as \newcommand, but discards them if #1 is already defined. Otherwise it just acts like \newcommand. This implementation currently leaves any discarded definition in \reserved@a (and possibly \\reserved@a) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

178 \def\providecommand{\@star@or@long\provide@command}

\provide@command 179 \def\provide@command#1{%
 180 \begingroup
 181 \escapechar\m@ne\xdef\@gtempa{{\string#1}}%
 182 \endgroup
 183 \expandafter\@ifundefined\@gtempa
 184 {\def\reserved@a{\new@command#1}}%
 185 {\def\reserved@a{\renew@command\reserved@a}}%
 186 \reserved@a}%

(End definition for \providecommand and \provide@command.)

\CheckCommand \CheckCommand takes the same arguments as \newcommand. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state before a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: \newcommand\xxx[2][a]{(#1)(#2)} then \CheckCommand\xxx[2][b]{(#1)(#2)} would not generate a warning, but, for instance \CheckCommand\xxx[2]{(#1)(#2)} would.

187 \def\CheckCommand{\@star@or@long\check@command}

\CheckCommand is only available in the preamble part of the document.

188 \onlypreamble\CheckCommand

\check@command 189 \def\check@command#1#2{\@check@c#1{#2}}
190 \onlypreamble\check@command

(End definition for \CheckCommand and \check@command.)

\@check@c \CheckCommand itself just grabs all the arguments we need, without actually looking for [optional argument forms. Now define \reserved@a. If \\reserved@a is then defined, compare it with the “\#1’ otherwise compare \reserved@a with #1.

191 \long\def\@check@c#1#2#3{%
 192 \expandafter\let\csname\string\reserved@a\endcsname\relax
 193 \renew@command\reserved@a#2{#3}%
 194 \@ifundefined{\string\reserved@a}%
 195 {\@check@eq#1\reserved@a}%
 196 {\expandafter\@check@eq
 197 \csname\string#1\expandafter\endcsname
 198 \csname\string\reserved@a\endcsname}%
 199 \onlypreamble\@check@c

(End definition for \@check@c.)

\@check@eq Complain if #1 and #2 are not \ifx equal.

```

200 \def \@check@eq#1#2{%
201   \ifx#1#2\else
202     \@latex@warning@no@line
203       {Command \noexpand#1 has
204        changed.\MessageBreak
205        Check if current package is valid}%
206   \fi}
207 \onlypreamble \@check@eq
```

(End definition for \@check@eq.)

\@gobble The \@gobble macro is used to get rid of its argument.
 \@gobbletwo
 \@gobblethree
 \@gobblefour

```

208 \long\def \@gobble #1{%
209   \long\def \@gobbletwo #1#2{%
210     \long\def \@gobblethree #1#2#3{%
211       \long\def \@gobblefour #1#2#3#4{}}
```

(End definition for \@gobble and others.)

\@firstofone Some argument-grabbers.
 \@firstoftwo
 \@secondoftwo

```

212 \long\def \@firstofone#1{#1}
213 \long\def \@firstoftwo#1#2{#1}
214 \long\def \@secondoftwo#1#2{#2}
```

\@iden is another name for \@firstofone for compatibility reasons.

```

215 \let \@iden \@firstofone
```

(End definition for \@firstofone and others.)

\@thirdofthree Another grabber now used in the encoding specific section.

```

216 \long\def \@thirdofthree#1#2#3{#3}
```

(End definition for \@thirdofthree.)

\@expandtwoargs A macro to totally expand two arguments to another macro

```

217 \def \@expandtwoargs#1#2#3{%
218   \edef\reserved@a{\noexpand#1{#2}{#3}}\reserved@a}
```

(End definition for \@expandtwoargs.)

\@backslashchar A category code 12 backslash.

```

219 \edef \@backslashchar{\expandafter\@gobble\string\\}
```

(End definition for \@backslashchar.)

1.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in L^AT_EX's commands. Whilst typesetting documents, L^AT_EX makes use of many of T_EX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by L^AT_EX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an `\edef`, `\message`, `\mark`, or other command which evaluates its argument fully.

The method L^AT_EX uses for making fragile commands robust is to precede them with `\protect`. This can have one of four possible values:

- `\relax`, for normal typesetting. So `\protect\foo` will execute `\foo`.
- `\string`, for writing to the screen. So `\protect\foo` will write `\foo`.
- `\noexpand`, for writing to a file. So `\protect\foo` will write `\foo` followed by a space.
- `\@unexpandable@protect`, for writing a moving argument to a file. So `\protect\foo` will write `\protect\foo` followed by a space. This value is also used inside `\edefs`, `\marks` and other commands which evaluate their arguments fully. More precisely, whenever the content of an `\edef` or `\xdef` etc. can contain arbitrary user input not under the direct control of the programmer, one should use `\protected@edef` instead of `\edef`, etc., so that `\protect` has a suitable definition and the user input will not break if it contains fragile commands.

```
\@unexpandable@protect
 220 \def\@unexpandable@protect{\noexpand\protect\noexpand}
(End definition for \@unexpandable@protect.)
```

`\DeclareRobustCommand` `\declare@robustcommand` This is a package-writers command, which has the same syntax as `\newcommand`, but which declares a protected command. It does this by having

`\DeclareRobustCommand\foo`
define `\foo` to be `\protect\foo<space>`,
and then use `\newcommand\foo<space>`.

Since the internal command is `\foo<space>`, when it is written to an auxiliary file, it will appear as `\foo`.

We have to be a bit cleverer if we're defining a short command, such as `_`, in order to make sure that the auxiliary file does not include a space after the command, since `_ a` and `_a` aren't the same. In this case we define `_` to be:

```
\x@protect\_ \protect\_<space>
```

which expands to:

```
\ifx\protect\@typeset@protect\else
  \x@protect@_
\fi
\protect\_<space>
```

Then if `\protect` is `\@typeset@protect` (normally `\relax`) then we just perform `_<space>`, and otherwise `\x@protect@` gobbles everything up and expands to `\protect_`.

Note: setting `\protect` to any value other than `\relax` whilst in ‘typesetting’ mode will cause commands to go into an infinite loop! In particular, setting `\protect` to `\empty` will cause `_` to loop forever. It will also break lots of other things, such as protected `\ifmmode`s inside `\haligns`. If you really have to do such a thing, then please set `\@typeset@protect` to be `\empty` as well. (This is what the code for `\patterns` does, for example.)

More fun with `\expandafter` and `\csname`.

```
221 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
222 \def\declare@robustcommand#1{%
223   \ifx#1\undefined\else\ifx#1\relax\else
224     \x@info{Redefining \string#1}%
225   \fi\fi
226   \edef\reserved@a{\string#1}%
227   \def\reserved@b{%
228     \expandafter\strip@prefix\meaning\reserved@b}%
229   \edef#1{%
230     \ifx\reserved@a\reserved@b
231       \noexpand\x@protect
232       \noexpand#1%
233     \fi
234     \noexpand\protect
235     \expandafter\noexpand\csname
236     \expandafter\gobble\string#1 \endcsname
237   }%
238   \let\@ifdefinable\@rc@ifdefinable
239   \expandafter\new@command\csname
240     \expandafter\gobble\string#1 \endcsname
241 }
```

(End definition for `\DeclareRobustCommand` and `\declare@robustcommand`.)

```
\x@protect
\x@protect
242 \def\x@protect#1{%
243   \ifx\protect\@typeset@protect\else
244     \x@protect#1%
245   \fi
246 }
247 \def\x@protect#1\fi#2#3{%
248   \fi\protect#1%
249 }
```

(End definition for `\x@protect` and `\x@protect`.)

`\@typeset@protect` We set `\@typeset@protect` to `\relax` rather than `\empty` to make sure that the protection mechanism stops the look-ahead and expansion performed at the start of `\halign` cells.

```
250 \let\@typeset@protect\relax
```

(End definition for \set@typeset@protect.)

\set@display@protect These macros set \protect appropriately for typesetting or displaying.

\set@typeset@protect
251 \def\set@display@protect{\let\protect\string}
252 \def\set@typeset@protect{\let\protect\@typeset@protect}

(End definition for \set@display@protect and \set@typeset@protect.)

\protected@edef \protected@xdef The commands \protected@edef and \protected@xdef perform ‘safe’ \edefs and \xdefs, saving and restoring \protect appropriately. For cases where restoring \protect doesn’t matter, there’s an ‘unsafe’ \unrestored@protected@xdef, useful if you know what you’re doing!

253 \def\protected@edef{
254 \let\@@protect\protect
255 \let\protect\@unexpandable@protect
256 \afterassignment\restore@protect
257 \edef
258 }
259 \def\protected@xdef{
260 \let\@@protect\protect
261 \let\protect\@unexpandable@protect
262 \afterassignment\restore@protect
263 \xdef
264 }
265 \def\unrestored@protected@xdef{
266 \let\protect\@unexpandable@protect
267 \xdef
268 }
269 \def\restore@protect{\let\protect\@@protect}

(End definition for \protected@edef and others.)

\protect The normal meaning of \protect

270 \set@typeset@protect

(End definition for \protect.)

\MakeRobust This macro makes an existing fragile macro robust, but only if it hasn’t been robust in the past, i.e., it checks for the existence of the macro \<name>_U and if that exists it assumes that \<name> is already robust. In that case either undefine the inner macro first or use \DeclareRobustCommand to define it in a robust way directly. We could probably test the top-level definition to have the right kind of structure, but this is somewhat problematical as we then have to distinguish between \long macros and others and also take into account that sometimes the top-level is deliberately done manually (like with \begin).

The macro firstly checks if the control sequence in question exists at all.

271 {/2ekernel}
272 {latexrelease}\IncludeInRelease{2020/10/01}{\MakeRobust}{\MakeRobust} %
273 {*2ekernel | latexrelease}
274 \def\MakeRobust#1{
275 \count@=\escapechar
276 \escapechar='\\
277 \@ifundefined{\expandafter\@gobble\string#1}{%
278 \@latex@error{Command '\string#1' undefined.}%

```

279      \MessageBreak There is nothing here to make robust}%
280      \@eha
281 }%

```

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely `\foo_`. If it is already defined do nothing, otherwise set `\foo_` equal to `\foo` and redefine `\foo` so that it acts like a macro defined with `\DeclareRobustCommand`. We use `\@kernel@rename@newcommand` to copy `\foo` over to `\foo_`, including a possible default optional argument.

```

282 }%
283   \@ifundefined{\expandafter\gobble\string#1\space}%
284 {%
285   \expandafter\@kernel@rename@newcommand
286     \csname\expandafter\gobble\string#1\space\endcsname
287     #1%
288   \edef\reserved@a{\string#1}%
289   \def\reserved@b{#1}%
290   \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
291   \xdef#1{%
292     \ifx\reserved@a\reserved@b
293       \noexpand\x@protect\noexpand#1%
294     \fi
295     \noexpand\protect\expandafter\noexpand
296     \csname\expandafter\gobble\string#1\space\endcsname}%
297   }%
298   {\@latex@info{Command ‘\string#1’ is already robust}}%
299 }%
300 \escapechar=\count@
301 }%

```

This macro renames a command, possibly with an optional argument (defined with `\newcommand`) from #2 to #1, by renaming the internal macro `\#2` to `\#1` and defining `\#1` appropriately, then undefining `\#2` and `\#2`. The `\afterassignment` trick is to make both definitions in `\copy@newcommand` global (which are local by default).

In case the macro was defined with `\newcommand` and an optional argument, to replicate exactly the behaviour of `\DeclareRobustCommand` we have to move also the internal `\foo` to `\foo_`. In that case, #1 will be a parameterless macro (`\robust@command@chk@safe` checks that), and `\@if@newcommand` will return true (both defined below in this file). If so, we can use `\copy@newcommand` rather than plain `\let` to copy the command over. `\@kernel@rename@newcommand` does this test and carries out the renaming.

(End definition for \MakeRobust and \@kernel@rename@newcommand.)

\@kernel@make@fragile The opposite of \MakeRobust except that it doesn't do many checks as it is internal to the kernel. Why does one want such a thing? Only for compatibility reasons if \latexrelease requests a rollback of the kernel. For this reason we pretend that this command existed in all earlier versions of L^AT_EX i.e., we are not rolling it back since we need it precisely then. But we have to get it into the \latexrelease file so that a roll forward is possible too.

1.5 Acting on robust commands

```

409 〈/2ekernel〉
410 〈/latexrelease〉\IncludeInRelease{2020-10-01}{\robust@command@act}
411 〈/latexrelease〉 {Add \robust@command@act}%
412 〈*2ekernel | latexrelease〉

```

With most document level commands being robust now there is more of a requirement to have a standard way of aliasing (or copying) a command to a new name, for example to save an original definition before changing a command. `\DeclareCommandCopy` is analogous to `TEX`'s `\let`, except that it copes with the different types of robust commands defined by L^AT_EX's mechanisms.

A couple of “types of robustness” are defined by the L^AT_EX 2 _{ε} kernel, namely robust commands defined with `\DeclareRobustCommand` and commands with optional arguments defined with `\newcommand`. However there are other types of robust commands that are frequently used, which are not defined in the L^AT_EX 2 _{ε} kernel, like commands defined with `xparse`'s `\NewDocumentCommand` and `etoolbox`'s `\newrobustcmd`.

In this section we will define a generic extensible machinery to act on robust commands. This code will then be used to test if a command is robust, considered the different types of robustness, and then either copy that definition, if `\DeclareCommandCopy` (or similar) is used, or show the definition of the command, if `\ShowCommand` is used.

`\robust@command@act` The looping machinery is generic and knows nothing about what is to be done for each case. The syntax of the main macro `\robust@command@act` is:

```
\robust@command@act<action-list><robust-cmd>
  <fallback-action><act-arg>
```

`<action-list>` is a token list of the form:

```
{<if-type-1> <act-type-1>}
 {<if-type-2> <act-type-2>}
 ...

```

`\robust@command@act` will iterate over the `<action-list>`, evaluating each `<if-type-n> <robust-cmd> {<true>} {<false>}`. If the `<if-type-n>` conditional returns `<true>`, then `<act-type-n><act-arg>` is executed, and the loop ends. If the conditional returns `<false>`, then `<if-type-n+1>` is executed in the same way, until either one of the conditionals return `<true>`, or the end of the `<action-list>` is reached. If the end is reached, then `<fallback-action><act-arg>` is executed before `\robust@command@act` exits.

`\robust@command@act` will start by using `\robust@command@act@chk@args` to check if the `<robust-cmd>` (#2) is a parameterless (possibly `\protected`) macro. If it is not, the command is not a robust command: these always start with a parameterless user-level macro; in that case, `\robust@command@act@end` is used to short-circuit the process and do the `<fallback-action>` (#3). This first test is necessary because later on we need to be able to expand the `<robust-cmd>` without the risk of it Breaking Badly, and as a bonus, this speeds up the process in case we used `\NewCommandCopy` in a “normal” macro.

```
413 \long\def\robust@command@act#1#2#3#{%
```

```

414 \robust@command@chk@safe#2%
415   {\expandafter\robust@command@act@loop
416     \expandafter#2%
417       #1{\@nnil\@nnil}%
418     \robust@command@act@end}%
419   {\robust@command@act@end}%
420     {#3}{#4}}%

```

If `\robust@command@act@chk@args` branched to false, then `\robust@command@act@loop` will loop over the list of items in the *<action-list>* (#1), and process each item as described earlier. If the *<if-type-n>* command expands to *<true>* then `\robust@command@act@do` is used to execute *<act-type-n>* on the *<act-arg>*, otherwise the loop resumes with the next item.

```

```

1.5.1 Copying robust commands

```

459  ⟨/2ekernel⟩
460  ⟨{latexrelease}⟩\IncludeInRelease[2020-10-01]{\DeclareCommandCopy}
461  ⟨{latexrelease}⟩ {Add \NewCommandCopy, \RenewCommandCopy, and \DeclareCommandCopy}%
462  ⟨*2ekernel | latexrelease⟩

\NewCommandCopy \RenewCommandCopy \DeclareCommandCopy

```

\NewCommandCopy starts by checking if #1 is already defined, and raises an error if so, otherwise the definition is carried out. \RenewCommandCopy does (almost) the opposite. If the command is *not* defined, then an error is raised. But the definition is carried out anyhow, so the behaviour is consistent with \renewcommand.

A \ProvideCommandCopy isn't defined because it's not reasonably useful. \provide... commands mean "define this if there's no other definition", but copying a command (usually) implies that the command being copied is defined, so \ProvideCommandCopy doesn't make a lot of sense. But more importantly, the most common use case of copying a command is to redefine it later, while preserving the old definition, as in:

```

\ProvideCommandCopy \A \B
\renewcommand \B { ... \A ... }

```

then, if \A is already defined the first line is skipped, an in this case \B won't work as expected.

The three versions call the internal \declare@commandcopy with the proper action. \@firstofone will carry out the copy. The only case when the copy is not made is the ⟨false⟩ case for \NewCommandCopy, in which the command already exists and the definition is aborted.

```

463  \def\NewCommandCopy{%
464    \declare@commandcopy
465    {\@firstofone}%
466    {\@firstoftwo\@notdefinable}%
467  \def\RenewCommandCopy{%
468    \declare@commandcopy
469    {\@latex@error{Command \backslash reserved@a\space undefined}\@ehc
470     \@firstofone}%
471    {\@firstofone}%
472  \def\DeclareCommandCopy{%
473    \declare@commandcopy
474    {\@firstofone}%
475    {\@firstofone}}

```

Start by checking if the command is already defined. The proper action is taken by each specific command above. If all's good, then \robust@command@act is called with the proper arguments as described earlier, with \declarecommandcopylisthook as the ⟨action-list⟩ and \declare@commandcopy@let as the ⟨fallback-action⟩.

```

476  \long\def\declare@commandcopy#1#2#3#4{%
477    \edef\reserved@a{\@expl@cs@to@str@ON#3}%
478    \@ifundefined\reserved@a{#1}{#2}%
479    {\robust@command@act
480      \@declarecommandcopylisthook#4%
481      \declare@commandcopy@let{#3#4}}}

```

The initial definition of `\@declarecommandcopylisthook` contains the tests for the two types of robust command in the kernel.

```
482 \def\@declarecommandcopylisthook{%
483   {\@if@DeclareRobustCommand \copy@DeclareRobustCommand}%
484   {\@if@newcommand \copy@newcommand}}
```

The initial definition of `\@declarecommandcopylisthook` contains the tests for the two types of robust command in the kernel.

```
485 \long\def\declare@commandcopy@let{\let#1=\relax}
```

`\declare@commandcopy@let`

Now the rollback code.

```
486 </2ekernel | latexrelease>
487 <latexrelease>\EndIncludeInRelease
488 <latexrelease>\IncludeInRelease{0000-00-00}{\DeclareCommandCopy}

497 <*2ekernel>
```

(*End definition for \NewCommandCopy and others.*)

1.5.2 Showing robust commands

`\ShowCommand` Most of the machinery defined for `\NewCommandCopy` can be used to show the definition of a robust command, in a similar fashion to `\texdef`. The difference is that after the command's is detected to has a given type of robustness, rather than making a copy, we use a separate routine to show its definition.

With all the machinery in place, `\ShowCommand` itself is quite simple: use `\robust@command@act` to iterate through the `\@showcommandlisthook` list, and if nothing is found, fallback to `\show`.

```
498 </2ekernel>
499 <latexrelease>\IncludeInRelease{2020-10-01}{\ShowCommand}%
500 <latexrelease> {Add \ShowCommand}%
501 <*2ekernel | latexrelease>

502 \long\def\ShowCommand#1{%
503   \robust@command@act
504   \@showcommandlisthook#1%
505   \show#1}
```

The initial definition of `\@showcommandlisthook` contains the same tests as used for copying, but `\@show@...` commands instead of `\copy@....` Same as before, it is initialized to cope with `\DeclareRobustCommand` and `\newcommand` with optional arguments.

```
506 \def\@showcommandlisthook{%
507   {\@if@DeclareRobustCommand \show@DeclareRobustCommand}%
508   {\@if@newcommand \show@newcommand}}
```

Now the rollback code.

```

(End definition for \ShowCommand and \@showcommandlisthook.)  
  
517 〈/2ekernel〉  
518 〈latexrelease〉\IncludeInRelease{2020-10-01}{\@if@DeclareRobustCommand}  
519 〈latexrelease〉 {Add \@if@DeclareRobustCommand, \@if@newcommand,  
520 〈latexrelease〉 \copy@DeclareRobustCommand, \copy@newcommand,  
521 〈latexrelease〉 \show@DeclareRobustCommand, \show@newcommand} %  
522 〈*2ekernel | latexrelease〉
```

1.5.3 Commands defined with \DeclareRobustCommand

\@if@DeclareRobustCommand Now that we provided a generic way to copy one macro to another, we need to define a way to check if a command is one of L^AT_EX 2_ε's robust types. These tests are heavily based on Heiko's \LetLtxMacro, but chopped into separate macros.

\@if@DeclareRobustCommand checks if a command \cmd was defined by \DeclareRobustCommand. The test returns true if the expansion of \cmd is exactly \protect\cmd.

```
523 \long\def\@if@DeclareRobustCommand#1{  
524   \begingroup  
525     \escapechar='\\  
526     \edef\reserved@a{\string#1}%  
527     \edef\reserved@b{\detokenize{#1}}%  
528     \xdef\@gtempa{  
529       \ifx\reserved@a\reserved@b  
530         \noexpand\x@protect  
531         \noexpand#1%  
532       \fi  
533       \noexpand\protect  
534       \expandafter\noexpand\csname\expl@cs@to@str@N#1 \endcsname}%  
535   \endgroup  
536   \ifx\@gtempa#1\relax  
537     \expandafter\@firstoftwo  
538   \else  
539     \expandafter\@secondoftwo  
540   \fi}
```

If a command was defined by \DeclareRobustCommand (that is, \@if@DeclareRobustCommand returns true), then to make a copy of \cmd into \foo we define the latter such that it expands to \protect\foo, then make \foo equal to \cmd.

There is one detail we need to take care of: if a command was defined with \DeclareRobustCommand it may still have an optional argument, in which case there is one more macro layer before the actual definition of the command. We use \@if@newcommand to check that and \copy@newcommand to do the copying.

```
541 \long\def\copy@DeclareRobustCommand#1#2{%
```

```

542 \begingroup
543   \escapechar='\\
544   \edef\reserved@a{\string#1}%
545   \edef\reserved@b{\detokenize{#1}}%
546   \edef\reserved@a{%
547 \endgroup
548 \def\noexpand#1{%
549   \ifx\reserved@a\reserved@b
550     \noexpand\x@protect
551     \noexpand#1%
552   \fi
553   \noexpand\protect
554   \expandafter\noexpand\csname\@expl@cs@to@str@@N#1 \endcsname}%
555 \noexpand\copy@kernel@robust@command
556   \expandafter\noexpand\csname\@expl@cs@to@str@@N#1 \endcsname
557   \expandafter\noexpand\csname\@expl@cs@to@str@@N#2 \endcsname}%
558 \reserved@a}
559 \long\def\copy@kernel@robust@command#1#2{%
560   \robust@command@chk@safe#2%
561   {\@if@newcommand#2%
562     {\@copy@newcommand}%
563     {\declare@commandcopy@let}%
564     {\declare@commandcopy@let}%
565   #1#2}

```

Showing the command is pretty simple. This command prints the top-level expansion as TeX's `\show` would, but with `robust macro:` rather than just `macro:`, then a blank line and then `\show` the inner command. For a macro defined with, say, `\DeclareRobustCommand\foo[1]{bar}`, it will print:

```

> \foo=robust macro:
->\protect \foo . 

> \foo =\long macro:
#1->bar.

```

If the inner command is defined with an optional argument, then `\@show@newcommand` is also used.

The value of `\escapechar` is deliberately not enforced, so `\ShowCommand` behaves more like `\show`.

```

566 \long\def\@show@DeclareRobustCommand#1{%
567   \typeout{> \string#1=robust macro:}%
568   \typeout{->\@expl@cs@replacement@spec@@N#1.^~J}%
569   \expandafter\show@kernel@robust@command
570   \csname\@expl@cs@to@str@@N#1 \endcsname}%
571 \long\def\show@kernel@robust@command#1{%
572   \robust@command@chk@safe#1%
573   {\@if@newcommand#1%
574     {\@show@newcommand}%
575     {\show}%
576     {\show}%
577   #1}

```

(End definition for `\@if@DeclareRobustCommand` and others.)

1.5.4 Commands defined with \newcommand (with optional argument)

\@if@newcommand A command \cmd (or \cmd_ if it was defined with \DeclareRobustCommand) with an optional argument will expand to \protected@testopt\cmd{\cmd{<opt>}}. To check that we look at the first three tokens in the expansion of \cmd, and return true or false accordingly.

This test *requires* that the command be a parameterless macro, otherwise it will not work (and probably break). This is ensured with \robust@command@chk@safe before calling \@if@newcommand.

```

578 \long\def\@if@newcommand#1{%
579   \edef\reserved@a{%
580     \noexpand\@protected@testopt
581     \noexpand#1%
582     \expandafter\noexpand\csname\@backslashchar\expl@cs@to@str@@N#1\endcsname}%
583   \edef\reserved@b{%
584     \unexpanded\expandafter\expandafter\expandafter
585       {\expandafter\@car\@cube#1{}{}{\@nil}}}%
586   \ifx\reserved@a\reserved@b
587     \expandafter\@firstoftwo
588   \else
589     \expandafter\@secondoftwo
590   \fi}

```

Then, if a command \cmd takes an optional argument, we copy it to \foo by defining the latter to expand to \protected@testopt\foo\foo{<opt>}.

```

591 \long\def\@copy@newcommand#1#2{%
592   \edef#1{\noexpand\@protected@testopt
593     \noexpand#1%
594     \expandafter\noexpand\csname\@backslashchar\expl@cs@to@str@@N#1\endcsname
595     \unexpanded\expandafter\expandafter\expandafter
596       {\expandafter\@gobblethree#2}}%
597   \expandafter
598   \let\csname\@backslashchar\expl@cs@to@str@@N#1\expandafter\endcsname
599   \csname\@backslashchar\expl@cs@to@str@@N#2\endcsname}

```

A command being \shown here is guaranteed to have an optional argument. Start by showing the top-level expansion of the command (using \typeout to avoid TeX asking for interaction and extra context lines), then call \@show@newcommand@aux with the internal command, which contains the actual definition, and with the expansion of the command to extract the default value of the optional argument.

```

600 \long\def\@show@newcommand#1{%
601   \typeout{> \string#1=robust macro:}%
602   \typeout{->\@expl@cs@replacement@spec@@N#1.^~J}%
603   \expandafter\@show@newcommand@aux
604   \csname\@backslashchar\expl@cs@to@str@@N#1\expandafter\endcsname
605   \expandafter{#1}}

```

For a macro defined with, say, \newcommand\foo[1][opt]{bar}, it will print:

```

> \foo=robust macro:
->\@protected@testopt \foo \\\foo {opt}.

> \\\foo=\long macro:

```

```
> default #1=opt.  
[#1]->bar.
```

If the command was defined with `\DeclareRobustCommand`, then another pair of lines show the top-level expansion `\protect\foo`.

The extra gymnastics with `\showtokens` ensures that `\showtokens` itself, and the internals of this macro aren't showed in the context lines.

```
606 \long\def\@show@newcommand@aux#1#2{%
607   \typeout{> \string#1=\@expl@cs@prefix@spec@@N#1macro:}%
608   \edef\reserved@a{%
609     default \string##1=\expandafter\detokenize@\gobblethree#2.^~J%
610     \@expl@cs@argument@spec@@N#1->\@expl@cs@replacement@spec@@N#1}%
611   \showtokens\expandafter\expandafter\expandafter{\expandafter\reserved@a}}
```

Now the rollback code.

```
612 </2ekernel | latexrelease>
613 <latexrelease>\EndIncludeInRelease
614 <latexrelease>\IncludeInRelease{0000-00-00}{\@if@DeclareRobustCommand}
615 <latexrelease>  {Undefine \@if@DeclareRobustCommand, \@if@newcommand,

668 {/latexrelease} \fi}
669 {/latexrelease}\EndIncludeInRelease
670 {/2ekernel}
```

(End definition for \@ifundefined.)

\@qend The following define \@qend and \@qrelax to be the strings ‘end’ and ‘relax’ with the characters \catcodel 12.

```
671 \edef\@qend{\expandafter\@cdr\string\end\@nil}
672 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}
```

(End definition for \@qend and \@qrelax.)

\@ifnextchar \@ifnextchar peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.

```
673 \long\def\@ifnextchar#1#2#3{%
674   \let\reserved@d=#1%
675   \def\reserved@a{#2}%
676   \def\reserved@b{#3}%
677   \futurelet\@let@token\@ifnch}
```

(End definition for `\@ifnextchar`.)

- `\kernel@ifnextchar` This macro is the kernel version of `\@ifnextchar` which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an `fd` file is loaded in a random place then the optional argument to `\ProvidesFile` could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the `amsmath` package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

```
678 \let\kernel@ifnextchar\@ifnextchar
```

(End definition for `\kernel@ifnextchar`.)

- `\@ifnch` `\@ifnch` is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls `xifnch`.

```
679 \def\@ifnch{%
680   \ifx\@let@token\@sptoken
681     \let\reserved@c\@xifnch
682   \else
683     \ifx\@let@token\reserved@d
684       \let\reserved@c\reserved@a
685     \else
686       \let\reserved@c\reserved@b
687     \fi
688   \fi
689 }
```

(End definition for `\@ifnch`.)

- `\@sptoken` The following code makes `\@sptoken` a space token. It is important here that the control sequence `\:` consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a `\let` may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of `\:` as math medium space.

```
690 \def\:\{\let\@sptoken= } \: % this makes \@sptoken a space token
```

(End definition for `\@sptoken`.)

- `\@xifnch` In the following definition of `\@xifnch`, `\:` is again used to get a space token as delimiter into the definition.

```
691 \def\:\{\@xifnch} \expandafter\def\:\ {\futurelet\@let@token\@ifnch}
```

(End definition for `\@xifnch`.)

- `\@ifstar` The new implementation below avoids passing the *true code* through one more `\def` than the *false code*, which previously meant that `#` had to be written as `####` in one argument, but `##` in the other. The `*` is gobbled by `\@firstoftwo`.

```
692 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}}
```

(End definition for `\@ifstar`.)

```

\@dblarg
\@xdblarg 693 \long\def\@dblarg#1{\kernel@ifnextchar[{\#1}{\@xdblarg{#1}}]}
694 \long\def\@xdblarg#1#2[#1[{\#2}]{#2}]

(End definition for \@dblarg and \@xdblarg.)

```

\@sanitize The command `\@sanitize` changes the catcode of all special characters except for braces to ‘other’. It can be used for commands like `\index` that want to write their arguments verbatim. Needless to say, this command should only be executed within a group, or chaos will ensue.

```

695 \def\@sanitize{\@makeother\ \@makeother\\ \@makeother\$ \@makeother\&%
696 \@makeother\#\@makeother\^ \@makeother\_ \@makeother\% \@makeother\~}

```

(End definition for \@sanitize.)

\@onelvel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12 tokens: it could be used in `\DeclareRobustCommand`.

If it is to be used on default float specifiers, this should be done when they are defined.

```

697 \def \@onelvel@sanitize #1{%
698   \edef #1{\expandafter\strip@prefix
699     \meaning #1}%
700 }

```

(End definition for \@onelvel@sanitize.)

\string@makeletter Iterates through a string, turning each alphabetic character into a catcode-11 token (partly undoes a `\detokenize`). Useful for `\ifx`-based string comparisons where `\detokenize`-ing the other string would break too much code.

The macro uses `expl3`’s `\Expl@str@map@function@@NN` to iterate on the string (without losing spaces) and applies `\string@makeletter` on each character. The latter checks if character is between a–z or A–Z, and uses `\@alph` or `\@Alph` to get the corresponding catcode-11 token. Other tokens are passed through unchanged.

```

2 Discretionary Hyphenation

\-

\@dischypf

Moved here to be after the definition of \DeclareRobustCommand.

The primitive \- command adds a discretionary hyphen using the current font's \hyphenchar. Monospace fonts are usually declared with \hyphenchar set to -1 to suppress hyphenation.

LATEX, from LATEX2.09 in 1986 defined \-

\def\-\{\discretionary{-}{ }{ }\}

The following comment was added when these commands were first set up, 19 April 1986:

the \- command is redefined to allow it to work in the \ttfamily type style,
where automatic hyphenation is suppressed by setting \hyphenchar to -1.
The original primitive TEX definition is saved as \@@hyph just in case anyone
needs it.

LATEX 2_ε, between 1993 and 2017, had a comment at this point saying that the
definition “would probably change” because the definition always uses -. The definition
used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older LATEX definition
accessible via latexrelease as usual.

In LuaLATEX the primitive definition of \- is used directly because it's use of extended
hyphenation parameters means that \- works correctly even with \hyphenchar set to -1.
This change makes \- under LuaLATEX compatible with language specific hyphenation
characters.

Temporary definition of \@latex@info, final definition is later.

ltcmd.dtx

1 Creating document commands

Document commands should be created using the tools provided by this module: `\NewDocumentCommand`, etc., in almost all cases. This allows clean separation of document-level syntax from code-level interfaces. Users have a need to create new document commands, and as such a significant amount of documentation for `ltcmd` is provided as part of `usrguide3`. Here, additional material aimed at programmers is provided

```
1 {@@=cmd}
2 {*2ekernel}
3 \message{document commands,}
4 {/2ekernel}
```

`ltcmd` code contains an `\^@` character, which usually has catcode 15, so `\IncludeInRelease` will break when this code is being skipped, so we'll save the catcode of `\^@` to restore later:

```
5 {*2ekernel | latexrelease}
6 {latexrelease}\edef\@latexrelease@catcode@null{\the\catcode'\^@ }
7 {latexrelease}\catcode'\^@=12
8 \ExplSyntaxOn
9 {latexrelease}\NewModuleRelease{2020/10/01}{ltcmd}
10 {latexrelease} {Document~command~parser} %
```

1.1 Variables and constants

`\l__cmd_arg_spec_tl` Holds the argument specification after normalization of shorthands.

```
11 \tl_new:N \l__cmd_arg_spec_tl
```

`\l__cmd_args_tl` Token list variable for grabbed arguments.

```
12 \tl_new:N \l__cmd_args_tl
```

`\l__cmd_args_i_tl` Hold the modified arguments when dealing with default values or processors.

`\l__cmd_args_ii_tl`

```
13 \tl_new:N \l__cmd_args_i_tl
14 \tl_new:N \l__cmd_args_ii_tl
```

`\l__cmd_current_arg_int` The number of the current argument being set up: this is used to make sure there are at most 9 arguments, then for creating the expandable auxiliary functions and knowing how many arguments the code function should take.

```
15 \int_new:N \l__cmd_current_arg_int
```

\l__cmd_defaults_bool The boolean indicates whether there are any argument with default value other than -*NoValue*-; the token list holds the code to determine these default values in terms of other arguments.

```
16 \bool_new:N \l__cmd_defaults_bool  
17 \tl_new:N \l__cmd_defaults_tl
```

\l__cmd_environment_bool Generating environments uses the same mechanism as generating functions. However, full processing of arguments is always needed for environments, and so the function-generating code needs to know this. This variable is also used at run time to give correct error messages.

```
18 \bool_new:N \l__cmd_environment_bool
```

\l__cmd_environment_str Name of the environment, used at definition time and at run time.

```
19 \str_new:N \l__cmd_environment_str
```

\l__cmd_expandable_bool Used to indicate if an expandable command is being generated, as this affects both the acceptable argument types and how they are implemented.

```
20 \bool_new:N \l__cmd_expandable_bool
```

\l__cmd_expandable_aux_name_tl

Used to create pretty-printing names for the auxiliaries: although the immediate definition does not vary, the full expansion does and so it does not count as a constant.

```
21 \tl_new:N \l__cmd_expandable_aux_name_tl  
22 \tl_set:Nn \l__cmd_expandable_aux_name_tl  
23 {  
24     \l__cmd_function_tl \c_space_tl  
25     ( arg~ \int_use:N \l__cmd_current_arg_int )  
26 }
```

\g__cmd_grabber_int Used (in exceptional cases) to get unique names for grabbers used by expandable commands.

```
27 \int_new:N \g__cmd_grabber_int
```

\l__cmd_fn_tl For passing the pre-formed name of the auxiliary to be used as the parsing function.

```
28 \tl_new:N \l__cmd_fn_tl
```

\l__cmd_fn_code_tl For passing the pre-formed name of the auxiliary that contains the actual code.

```
29 \tl_new:N \l__cmd_fn_code_tl
```

\l__cmd_function_tl Holds the control sequence name of the function currently being defined: used to avoid passing this as an argument and to avoid repeated use of \cs_to_str:N.

³⁰ \tl_new:N \l__cmd_function_tl

\l__cmd_grab_expandably_bool

When defining a non-expandable command, indicates whether the arguments can all safely be grabbed by expandable grabbers. This is to support abuses of *xparse* that use protected functions inside csname constructions.

³¹ \bool_new:N \l__cmd_grab_expandably_bool

\l__cmd_obey_spaces_bool For trailing optionals.

³² \bool_new:N \l__cmd_obey_spaces_bool

\l__cmd_last_delimiters_tl Holds the delimiters (first tokens) of all optional arguments since the previous mandatory argument, to warn about cases where it would be impossible to omit optional arguments completely because the following mandatory argument has the same delimiter as one of the optional arguments.

³³ \tl_new:N \l__cmd_last_delimiters_tl

\l__cmd_long_bool Used to indicate that an argument is long, on a per-argument basis.

³⁴ \bool_new:N \l__cmd_long_bool

\l__cmd_m_args_int The number of *m* arguments: if this is the same as the total number of arguments, then a short-cut can be taken in the creation of the grabber code.

³⁵ \int_new:N \l__cmd_m_args_int

\l__cmd_prefixed_bool When preparing the signature of non-expandable commands, indicates that the current argument is affected by a processor or by + (namely is long).

³⁶ \bool_new:N \l__cmd_prefixed_bool

\l__cmd_process_all_tl
\l__cmd_process_one_tl
\l__cmd_process_some_bool When preparing the signature, the processors that will be applied to a given argument are collected in \l__cmd_process_one_tl, while \l__cmd_process_all_tl contains processors for all arguments. The boolean indicates whether there are any processors (to bypass the whole endeavour otherwise).

³⁷ \tl_new:N \l__cmd_process_all_tl

³⁸ \tl_new:N \l__cmd_process_one_tl

³⁹ \bool_new:N \l__cmd_process_some_bool

`\l__cmd_saved_args_tl` Stores `\l__cmd_args_tl` to deal with space-trimming of b-type arguments.

40 `\tl_new:N \l__cmd_saved_args_tl`

`\l__cmd_signature_tl` Used when constructing the signature (code for argument grabbing) to hold what will become the implementation of the main function. When arguments are grabbed (at point of use of the command/environment), it also stores the code for grabbing the remaining arguments.

41 `\tl_new:N \l__cmd_signature_tl`

`\l__cmd_some_obey_spaces_bool`
`\l__cmd_some_long_bool`
`\l__cmd_some_short_bool`

These flags are set while normalizing the argument specification. The `obey_spaces` one is used to detect when ! is used on an argument that is not a trailing optional argument. The other two are used to check whether all short arguments appear before long arguments: this is needed to grab arguments expandably. As soon as the first long argument is seen (other than t-type, whose long status is ignored) the `some_long` flag is set. The `some_short` flag is used for expandable commands, to know whether to define a short auxiliary too.

42 `\bool_new:N \l__cmd_some_obey_spaces_bool`
43 `\bool_new:N \l__cmd_some_long_bool`
44 `\bool_new:N \l__cmd_some_short_bool`

`\l__cmd_tmp_prop`
`\l__cmd_tmptl`
`\l__cmd_tmpb_tl`

Scratch space.
45 `\prop_new:N \l__cmd_tmp_prop`
46 `\tl_new:N \l__cmd_tmptl`
47 `\tl_new:N \l__cmd_tmpb_tl`
48 `\cs_new_eq:NN \l__cmd_tmp:w ?`

(End definition for `\l__cmd_tmp:w`.)

With `xparse`, information about commands being (re)defined was switched off by default, unless the `log-declarations` package option was used, so here we'll switch that off as well.

49 `\msg_redirect_module:nnn { cmd } { info } { none }`

Also add `cmd` to the `LaTeX` messages.

50 `\prop_gput:Nnn \g_msg_module_type_prop { cmd } { LaTeX }`

1.2 Declaring commands and environments

The main functions for creating commands set the appropriate flag then use the same internal code to do the definition.

51 `\cs_new_protected:Npn \l__cmd_declare_cmd:Nnn`
52 {
53 `\bool_set_false:N \l__cmd_expandable_bool`

```

54      \__cmd_declare_cmd_aux:Nnn
55  }
56 \cs_new_protected:Npn \__cmd_declare_expandable_cmd:Nnn
57 {
58     \bool_set_true:N \l__cmd_expandable_bool
59     \__cmd_declare_cmd_aux:Nnn
60 }

```

The first stage is to log information, both for the user in the log and for programmatic use in a property list of all declared commands.

```

61 \cs_new_protected:Npn \__cmd_declare_cmd_aux:Nnn #1#2#3
62 {
63     \cs_if_exist:NTF #1
64     {
65         \msg_info:nxxx { cmd } { redefine }
66         { \token_to_str:N #1 } { \tl_to_str:n {#2} }
67     }
68     {
69         \bool_lazy_or:nnT
70         { \cs_if_exist_p:c { \cs_to_str:N #1 ~ code } }
71         { \cs_if_exist_p:c { \cs_to_str:N #1 ~ defaults } }
72         {
73             \msg_warning:nnx { cmd } { unsupported-let }
74             { \token_to_str:N #1 }
75         }
76         \msg_info:nxxx { cmd } { define-command }
77         { \token_to_str:N #1 } { \tl_to_str:n {#2} }
78     }
79     \bool_set_false:N \l__cmd_environment_bool
80     \__cmd_declare_cmd_internal:Nnnn #1 {#2} {#3} { }
81 }

```

At definition time, the variable `\l__cmd_fn_tl` is only used for error messages. The real business of defining a document command starts with setting up the appropriate name, then normalizing the argument specification to get rid of shorthands.

```

82 \cs_new_protected:Npn \__cmd_declare_cmd_internal:Nnnn #1#2#3#4
83 {
84     \tl_set:Nx \l__cmd_function_tl { \cs_to_str:N #1 }
85     \tl_set:Nx \l__cmd_fn_tl
86     { \exp_not:c { \l__cmd_function_tl \c_space_tl } }
87     \__cmd_normalize_arg_spec:n {#2}
88     \exp_args:No \__cmd_prepare_signature:n \l__cmd_arg_spec_tl
89     \__cmd_declare_cmd_code:Nnn #1 {#2} {#3}
90     #4
91     \__cmd_break_point:n {#2}
92 }

```

(End definition for `__cmd_declare_cmd:Nnn` and others.)

`__cmd_break_point:n` A marker used to escape from creating a definition if necessary.

```

93 \cs_new_eq:NN \__cmd_break_point:n \use_none:n

```

(End definition for `__cmd_break_point:n`.)

```
\_\_cmd\_declare\_cmd\_code:Nnn
\_\_cmd\_declare\_cmd\_code\_aux:Nnn
\_\_cmd\_declare\_cmd\_code\_expandable:Nnn
```

The appropriate auxiliary is called.

```
94 \cs_new_protected:Npn \_\_cmd\_declare\_cmd\_code:Nnn
95 {
96     \bool_if:NTF \l__cmd_grab_expandably_bool
97     { \_\_cmd_declare_cmd_code_expandable:Nnn }
98     { \_\_cmd_declare_cmd_code_aux:Nnn }
99 }
```

Standard functions call `__cmd_start:nNNnnn`, which receives the argument specification, an auxiliary used for grabbing arguments, an auxiliary containing the code, and then the signature, default arguments, and processors.

```
100 \cs_new_protected:Npn \_\_cmd_declare_cmd_code_aux:Nnn #1#2#3
101 {
102     \cs_generate_from_arg_count:cNnn
103     { \l__cmd_function_tl \c_space_tl code }

114             \exp_not:c { \l__cmd_function_tl \c_space_tl }
115             \exp_not:c { \l__cmd_function_tl \c_space_tl code }
116         }
117         { \exp_not:o \l__cmd_signature_tl }
118         {
119             \bool_if:NT \l__cmd_defaults_bool
120             { \exp_not:o \l__cmd_defaults_tl }
121         }
122         {
123             \bool_if:NT \l__cmd_process_some_bool
124             { \exp_not:o \l__cmd_process_all_tl }
125         }
126     }
127 }
```

Expandable functions and functions whose arguments can be grabbed expandably call `__cmd_start_expandable:nNNNNn`, which receives the argument specification, four auxiliaries (two for grabbing arguments, one for the code, and one for default arguments), and finally the signature. Non-expandable functions that take this branch should nevertheless be protected, as well as their `code` function. They will only be expanded in contexts such as constructing a `cname`. The two grabbers (named after the function with one or two spaces) are needed when there are both short and long arguments; otherwise the same grabber is included twice in the definition. If all arguments are long or all are short (only) grabber is defined correspondingly to be long/short. Otherwise two grabbers are defined, one long, one short.

```
128 \cs_new_protected:Npn \_\_cmd_declare_cmd_code_expandable:Nnn #1#2#3
129 {
130     \exp_args:Ncc \cs_generate_from_arg_count:NNnn
131     { \l__cmd_function_tl \c_space_tl code }
```

```

132   { cs_set \bool_if:NF \l__cmd_expandable_bool { _protected } :Npn }

 \l__cmd_declare_cmd_code_expandable:Nnn.)
```

\l__cmd_declare_env:nnnn
\l__cmd_declare_env_internal:nnnn

The lead-off to creating an environment is much the same as that for creating a command: issue the appropriate message, store the argument specification then hand off to an internal function.

```

174 \cs_new_protected:Npn \l__cmd_declare_env:nnnn #1#2
175 {
176   \str_set:Nx \l__cmd_environment_str {#1}
177   \str_set:Nx \l__cmd_environment_str
178   { \tl_trim_spaces:o { \l__cmd_environment_str } }
```

```

179   \cs_if_exist:cTF { \l__cmd_environment_str }
180   {
181     \msg_info:nxxx { cmd } { redefine-env }
182     { \l__cmd_environment_str } { \tl_to_str:n {#2} }
183   }
184   {
185     \msg_info:nxxx { cmd } { define-env }
186     { \l__cmd_environment_str } { \tl_to_str:n {#2} }
187   }
188 \bool_set_false:N \l__cmd_expandable_bool
189 \bool_set_true:N \l__cmd_environment_bool
190 \exp_args:NV \__cmd_declare_env_internal:nnnn
191   \l__cmd_environment_str {#2}
192 }

```

Creating a document environment requires a few more steps than creating a single command. In order to pass the arguments of the command to the end of the function, it is necessary to store the grabbed arguments. To do that, the function used at the end of the environment has to be redefined to contain the appropriate information. To minimize the amount of expansion at point of use, the code here is expanded now as well as when used. The last argument of `__cmd_declare_cmd_internal:Nnnn` is only run if the definition succeeded. In package mode this ensures that the original definition of the environment is not changed if the definition fails for any reason. This also avoids an error when defining the `end_aux` function when the user asks for more than 9 arguments.

```

193 \cs_new_protected:Npn \__cmd_declare_env_internal:nnnn #1#2#3#4
194   {
195     \exp_args:Nc \__cmd_declare_cmd_internal:Nnnn { environment~ #1 } {#2}

212       \exp_not:o \l__cmd_args_tl
213     }
214 }

```

(End definition for `__cmd_declare_env:nnnn` and `__cmd_declare_env_internal:nnnn`.)

1.3 Structure of `xparse` commands

`__cmd_start_env:nnnn`
`__cmd_start:nNNnn`

For error messages that occur during run-time when getting arguments of environments it is necessary to keep track of the environment name. We begin non-expandable commands with a token equal to `\scan_stop:`, whose name gives a reasonable error message

if the command is used inside a csname and protects against f-expansion. This is useless for environments since \begin is already not expandable. Both the command and environment codes start with \group_align_safe_begin:, then \cmd_run_code: (used by both) does \group_align_safe_end:, so that delimited arguments may be grabbed in alignments if they contain and alignment tab token (see latex3/latex3/issues/839).

```

215 \cs_new_protected:Npn \__cmd_start_env:nnnnn #1#2
216 {
217     \conditionally@traceoff
218     \group_align_safe_begin:
219     \str_set:Nn \l__cmd_environment_str {#2}
220     \bool_set_true:N \l__cmd_environment_bool
221     \__cmd_start_aux:ccnnnn
222     { environment~\l__cmd_environment_str \c_space_tl }
223     { environment~\l__cmd_environment_str \c_space_tl code }
224     {#1}
225 }
226 \cs_new_protected:Npx \__cmd_start:nNnnn #1#2#3
227 {
228     \exp_not:c { xparse~function~is~not~expandable }
229     \exp_not:N \conditionally@traceoff
230     \exp_not:N \group_align_safe_begin:
231     \exp_not:n { \bool_set_false:N \l__cmd_environment_bool }
232     \exp_not:N \__cmd_start_aux:NNnnn
233     #2 #3 {#1}
234 }
```

(End definition for __cmd_start_env:nnnnn and __cmd_start:nNnnn.)

__cmd_start_aux:NNnnn
__cmd_start_aux:ccnnnn

This sets up a few variables to minimize the boilerplate code included in all xparse-defined commands. It then runs the grabbers #4. Again, the argument specification #1 is only for diagnostics.

```

235 \cs_new_protected:Npn \__cmd_start_aux:NNnnnn #1#2#3#4#5#6
236 {
237     \tl_clear:N \l__cmd_args_tl
238     \tl_set:Nn \l__cmd_fn_tl {#1}
239     \tl_set:Nn \l__cmd_fn_code_tl {#2}
240     \tl_set:Nn \l__cmd_defaults_tl {#5}
241     \tl_set:Nn \l__cmd_process_all_tl {#6}

243     \__cmd_run_code:
244 }
245 \cs_generate_variant:Nn \__cmd_start_aux:NNnnnn { cc }
```

(End definition for __cmd_start_aux:NNnnnn.)

__cmd_run_code:
After arguments are grabbed, this function is responsible for inserting default values, running processors, and finally doing \group_align_safe_end: as promised, and running the code.

```

246 \cs_new_protected:Npn \__cmd_run_code:
247 {
248     \tl_if_empty:NF \l__cmd_defaults_tl { \__cmd_defaults: }
249     \tl_if_empty:NF \l__cmd_process_all_tl { \__cmd_args_process: }
250     \bool_if:NT \l__cmd_environment_bool
251         { \exp_args:No \__cmd_set_environment_end:n \l__cmd_environment_str }
```

```

252     \group_align_safe_end:
253     \conditionally@traceon
254     \exp_after:wN \l__cmd_fn_code_tl \l__cmd_args_tl
255 }

```

(End definition for `__cmd_run_code`..)

`__cmd_defaults:` `__cmd_defaults_def:` `__cmd_defaults_def:nn` `__cmd_defaults_def:nnn` `__cmd_defaults_aux:` `__cmd_defaults_error:w`

First construct `__cmd_tmp:w` (see below) that will receive the arguments found so far and determine default values for any missing argument. Then call it repeatedly until the set of arguments stabilizes. Since that could lead to an infinite loop we only call it up to nine times, the maximal number needed for stabilization if there is a chain of arguments that depend on each other. If that fails to stabilize raise an error.

```

256 \cs_new_protected:Npn \__cmd_defaults:
257 {
258     \__cmd_defaults_def:
259     \tl_set_eq:NN \l__cmd_args_i_tl \l__cmd_args_tl

```
\__cmd_start_expandable:nNNNN
```

This is called for all expandable commands. #6 is the signature, responsible for grabbing arguments. #5 is used to determine default values (or is ? if there are none). #4 is

the code to run. #2 and #3 are functions (named after the command) that grab a single argument in the input stream (#3 is short). The argument specification #1 is only used by diagnostic functions. Same as for the non-expandable version, this starts with \group_align_safe_begin:, which expands to nothing, so may be safely used in an expandable context.

```

333 \cs_new:Npn \__cmd_start_expandable:nNNNNn #1#2#3#4#5#6
334 {
335     \group_align_safe_begin:
336     #6 \__cmd_end_expandable:NNw #5 #4 \q__cmd #2#3
337 }

```

(End definition for __cmd_start_expandable:nNNNNn.)

Followed by a function #1 to determine default values (or ? if there are no defaults), the code #2, arguments that have been grabbed, then \q__cmd and two generic grabbers. The idea to find default values is similar to the non-expandable case but we cannot define an auxiliary function, so at every step in the loop we need to go through all arguments searching for which ones started out as -NoValue- and replacing these by the newly computed values. In fact we need to keep track of three versions of all arguments: the original version, the previous version with default values, and the currently built version (first argument of __cmd_end_expandable_defaults:nnnNNn).

```

338 \cs_new:Npn \__cmd_end_expandable:NNw #1#2

```

(End definition for `__cmd_end_expandable:NNw` and others.)

1.4 Normalizing the argument specifications

The goal here is to expand aliases and check that the argument specification is valid before the main parsing run. If it is not valid the entire set up is abandoned to avoid any strange internal errors. A function is provided for each argument type that will grab any extra data items and call the loop function after performing the following checks and tasks.

- Check that each argument has the correct number of data items associated with it, and that where a single character is required, one has actually been supplied.
- Check that processors and the markers + and ! are followed by an argument for which they make sense, and are not redundant.
- Check the absence of forbidden types for expandable commands, namely G/v always, and l/u after optional arguments (`xparse` may have inserted braces due to a failed search for an optional argument).
- Check that no optional argument is followed by a mandatory argument with the same delimiter, as otherwise the optional argument could never be omitted.
- Keep track in `\l__cmd_some_long_bool` and `\l__cmd_some_short_bool` of whether the command has some long/short arguments.
- Keep track in `\l__cmd_grab_expandably_bool` of whether all arguments are m/l/u type and short arguments appear before long ones, in which case they can be grabbed expandably just as safely as they could be grabbed nonexpandably. Regardless of that, arguments of expandable commands will be grabbed expandably and arguments of environments will not (because the list of arguments built by non-expandable grabbing is used to pass them to the end-environment code).

Further checks happen at the end of the loop:

- that there are at most 9 arguments;
- that an expandable command does not end with an optional argument (this case is detected by using the fact that `\l__cmd_last_delimiters_tl` is cleared by every mandatory argument and filled by every optional argument).

```

\__cmd_normalize_arg_spec:n Loop through the argument specification, calling an auxiliary specific to each argument
\__cmd_normalize_arg_spec_loop:n type. If any argument is unknown stop the definition.

`__cmd_normalize_type_D:w` Optional argument types. Check that all required data is present (and consists of single characters if applicable) and check for forbidden types for expandable commands. For E-type require that there is at least one embellishment, that each one is a single character, and that there aren't more optional arguments than embellishments; also remember that each embellishment counts as one argument for `\l__cmd_current_arg_int`. Then in each case store the data in `\l__cmd_arg_spec_tl`, and for later checks store in `\l__cmd_last_delimiters_tl` the tokens whose presence determines whether there is an optional argument (for braces store {}, seen later as an empty delimiter).

```

__cmd_allowed_token_check:N Some tokens are now allowed as delimiters for some argument types, notably implicit begin/end-group tokens (\bgroup/\egroup). The major problem with these tokens is that for \peek_... functions, a literal {₁. is virtually indistinguishable from a \bgroup or other token which was \let to a {₁, and the same goes for }₂. All other tokens can be easily distinguished from their implicit counterparts by grabbing them and looking at the string length (see __cmd_token_if_cs:NTF), but for begin/end group tokens

that is not possible without the risk of mistakenly grabbing the entire brace group (potentially leading to a ! Runaway argument error) or trying to grab a $\}$, leading to an ! Argument of \dots has an extra } error.

```

(End definition for `__cmd_add_arg_spec:n` and `__cmd_add_arg_spec_mandatory:n`.)

1.5 Preparing the signature: general mechanism

`__cmd_prepare_signature:n`
`__cmd_prepare_signature:N`
`__cmd_prepare_signature_bypass:N`

Actually creating the signature uses the same loop approach as normalizing the signature. There are first a number of variables which need to be set to track what is going on. Many of these variables are unused when defining expandable commands.

```

688  \cs_new_protected:Npn \__cmd_prepare_signature:n #1
689  {
690    \int_zero:N \l__cmd_current_arg_int
691    \bool_set_false:N \l__cmd_long_bool
692    \bool_set_false:N \l__cmd_obey_spaces_bool
693    \int_zero:N \l__cmd_m_args_int
694    \bool_set_false:N \l__cmd_defaults_bool
695    \tl_clear:N \l__cmd_defaults_tl
696    \tl_clear:N \l__cmd_process_all_tl
697    \tl_clear:N \l__cmd_process_one_tl
698    \bool_set_false:N \l__cmd_process_some_bool
699    \tl_clear:N \l__cmd_signature_tl
700    \__cmd_prepare_signature:N #1 \q_recursion_tail \q_recursion_stop
701    \bool_if:NF \l__cmd_expandable_bool { \__cmd_flush_m_args: }
702  }

```

The main looping function does not take an argument, but carries out the reset on the processor boolean. This is split off from the rest of the process so that when actually setting up processors the flag-reset can be bypassed.

For each known argument type there is an appropriate function to actually do the addition to the signature. These are separate for expandable and standard functions, as the approaches are different.

```

703  \cs_new_protected:Npn \__cmd_prepare_signature:N
704  {
705    \bool_set_false:N \l__cmd_prefixed_bool
706    \__cmd_prepare_signature_bypass:N
707  }
708  \cs_new_protected:Npn \__cmd_prepare_signature_bypass:N #1
709  {
710    \quark_if_recursion_tail_stop:N #1
711    \use:c
712    {

```

```

713      __cmd_add
714      \bool_if:NT \l__cmd_grab_expandably_bool { _expandable }
715      _type_ \token_to_str:N #1 :w
716    }
717  }

(End definition for \__cmd_prepare_signature:n, \__cmd_prepare_signature:N, and
\__cmd_prepare_signature_bypass:N.)

```

1.6 Setting up a standard signature

Each argument-adding function appends to the signature a grabber (and for some types, the delimiters or default value), except the one for `m` arguments. These are collected and added to the signature all at once by `__cmd_flush_m_args:`, called for every other argument type. All of the functions then call the loop function `__cmd_prepare_signature:N`. Default values of arguments are collected by `__cmd_add_default:n` rather than being stored with the argument; this function and `__cmd_add_default:` are also responsible for keeping track of `\l__cmd_current_arg_int`.

`__cmd_add_type_+::w` Making the next argument long means setting the flag. The `m` arguments are recorded here as this has to be done for every case where there is then a long argument.

```

718 \cs_new_protected:cpn { __cmd_add_type_+::w }
719 {
720   __cmd_flush_m_args:
721   \bool_set_true:N \l__cmd_long_bool
722   \bool_set_true:N \l__cmd_prefixed_bool
723   \__cmd_prepare_signature_bypass:N
724 }

```

(End definition for __cmd_add_type_+::w.)

`__cmd_add_type_!::w` Much the same for controlling trailing optional arguments.

```

725 \cs_new_protected:cpn { __cmd_add_type_!::w }
726 {
727   __cmd_flush_m_args:
728   \bool_set_true:N \l__cmd_obey_spaces_bool
729   \bool_set_true:N \l__cmd_prefixed_bool
730   \__cmd_prepare_signature_bypass:N
731 }

```

(End definition for __cmd_add_type_!::w.)

`__cmd_add_type_>::w` When a processor is found, the processor code is stored. It will be used by `__cmd_args_process:` once arguments are all found. Here too the loop calls `__cmd_prepare_signature_bypass:N` rather than `__cmd_prepare_signature:N` so that the flag is not reset.

```

732 \cs_new_protected:cpn { __cmd_add_type_>::w } #1
733 {
734   __cmd_flush_m_args:
735   \bool_set_true:N \l__cmd_prefixed_bool
736   \bool_set_true:N \l__cmd_process_some_bool
737   \tl_put_left:Nn \l__cmd_process_one_tl { {#1} }
738   \__cmd_prepare_signature_bypass:N
739 }

```

(End definition for `__cmd_add_type_>:w.`)

```
\_\_cmd\_add\_type\_b:w
740 \cs_new_protected:Npn \_\_cmd\_add\_type\_b:w
741 {
742     \_\_cmd\_flush_m\_args:
743     \_\_cmd\_add\_default:
744     \_\_cmd\_add\_grabber:N b
745     \_\_cmd\_prepare\_signature:N
746 }
```

(End definition for `__cmd_add_type_b:w.`)

```
\_\_cmd\_add\_type\_D:w
747 \cs_new_protected:Npn \_\_cmd\_add\_type\_D:w #1#2#3
748 {
749     \_\_cmd\_flush_m\_args:
750     \_\_cmd\_add\_default:n {#3}
751     \_\_cmd\_add\_grabber:N D
752     \tl_put_right:Nn \l_\_cmd\_signature_tl { #1 #2 }
753     \_\_cmd\_prepare\_signature:N
754 }
```

(End definition for `__cmd_add_type_D:w.`)

`__cmd_add_type_E:w` The E-type argument needs a special handling of default values. Since each embellishment is a separate argument, it also needs to replicate the argument processors for each embellishment argument so that the numbers of arguments and processors remain in sync.

```
755 \cs_new_protected:Npn \_\_cmd\_add\_type\_E:w #1#2
756 {
757     \_\_cmd\_flush_m\_args:
758     \_\_cmd\_add\_default_E:nn {#1} {#2}
759     \use:x
760     {
761         \_\_cmd\_replicate_processor:nn { \tl_count:n {#1} }
762         { \exp_not:o \l_\_cmd\_process\_one_tl }
763     }
764     \_\_cmd\_add\_grabber:N E
765     \tl_put_right:Nn \l_\_cmd\_signature_tl { {#1} }
766     \_\_cmd\_prepare\_signature:N
767 }
```

(End definition for `__cmd_add_type_E:w.`)

`__cmd_replicate_processor:nn` In the command's argument processor signature (the final argument of `__cmd_start:nNNnnn`) there is one braced item for each formal argument (up to nine), and in each of these items there is one braced item for each processor (as many as there were processors declared for a given argument). Something like this:

```
{ % argument processors
{ % argument 1
{ processor 1 } { processor 2 } ... { processor n }
```

```

} % end argument 1
{ ... } % argument 2
:
{ ... } % argument n
} % end argument processors

```

The function `__cmd_add_grabber:N` adds one single grabber for an argument, and adds the braced item for that one argument. However, in an E-type argument each embellishment requires its own formal argument, so we need to break out of one layer of braces in `\l__cmd_process_one_tl`, add copies of the processor as necessary, and then return the removed brace. The function below does just that: it defines `\l__cmd_process_one_tl` starting with a `}_2` and ending with a `{_1`, so that it adds as many processors as needed when x-expanded.

```

768 \cs_new_protected:Npn \__cmd_replicate_processor:nn #1 #2
769  {
770    \int_compare:nNnF {#1} > { 1 } { \use_none:nn }
771    \tl_set:Nx \l__cmd_process_one_tl
772    {
773      \exp_not:n { \exp_not:n {#2} \if_false: { \fi: } }
774      \prg_replicate:nn { #1 - 2 }
775      { \exp_not:n { \exp_not:n { {#2} } } }
776      \exp_not:n { { \if_false: } \fi: \exp_not:n {#2} }
777    }
778  }

```

(End definition for `__cmd_replicate_processor:nn`.)

`__cmd_add_type_m:w` The `m` type is special as short arguments which are not post-processed are simply counted at this stage. Thus there is a check to see if either of these cases apply. If so, a one-argument grabber is added to the signature. On the other hand, if a standard short argument is required it is simply counted at this stage, to be added later using `__cmd_flush_m_args:`.

```

779 \cs_new_protected:Npn \__cmd_add_type_m:w
780  {
781    \__cmd_add_default:
782    \bool_if:NTF \l__cmd_prefixed_bool
783      { \__cmd_add_grabber:N m }
784      { \int_incr:N \l__cmd_m_args_int }
785    \__cmd_prepare_signature:N
786  }

```

(End definition for `__cmd_add_type_m:w`.)

`__cmd_add_type_R:w` The R-type argument is very similar to the D-type.

```

787 \cs_new_protected:Npn \__cmd_add_type_R:w #1#2#3
788  {
789    \__cmd_flush_m_args:
790    \__cmd_add_default:n {#3}
791    \__cmd_add_grabber:N R
792    \tl_put_right:Nn \l__cmd_signature_tl { #1 #2 }
793    \__cmd_prepare_signature:N
794  }

```

(End definition for `__cmd_add_type_R:w.`)

`__cmd_add_type_t:w` Setting up a `t` argument means collecting one token for the test, and adding it along with the grabber to the signature.

```
795 \cs_new_protected:Npn \_\_cmd\_add\_type\_t:w #1
796 {
797     \_\_cmd\_flush_m\_args:
798     \_\_cmd\_add\_default:
799     \_\_cmd\_add\_grabber:N t
800     \tl_put_right:Nn \l_\_\_cmd\_signature_tl {\#1}
801     \_\_cmd\_prepare\_signature:N
802 }
```

(End definition for `__cmd_add_type_t:w.`)

`__cmd_add_type_v:w` At this stage, the `v` argument is identical to `l` except that since the grabber may fail to read a verbatim argument we need a default value.

```
803 \cs_new_protected:Npn \_\_cmd\_add\_type\_v:w
804 {
805     \_\_cmd\_flush_m\_args:
806     \exp_args:No \_\_cmd\_add\_default:n \c_novalue_tl
807     \_\_cmd\_add\_grabber:N v
808     \_\_cmd\_prepare\_signature:N
809 }
```

(End definition for `__cmd_add_type_v:w.`)

`__cmd_flush_m_args:` As `m` arguments are simply counted, there is a need to add them to the token register in a block. As this function can only be called if something other than `m` turns up, the flag can be switched here.

```
810 \cs_new_protected:Npn \_\_cmd\_flush_m\_args:
811 {
812     \int_compare:nNnT \l_\_\_cmd_m\_args_int > 0
813     {
814         \tl_put_right:Nx \l_\_\_cmd\_signature_tl
815         { \exp_not:c { \_\_cmd\_grab_m\_ \int_use:N \l_\_\_cmd_m\_args_int :w } }
816         \tl_put_right:Nx \l_\_\_cmd\_process\_all_tl
817         { \prg_replicate:nn { \l_\_\_cmd_m\_args_int } { { } } }
818     }
819     \int_zero:N \l_\_\_cmd_m\_args_int
820 }
```

(End definition for `__cmd_flush_m_args:.`)

`__cmd_add_grabber:N` To keep the various checks needed in one place, adding the grabber to the signature is done here. The only questions are whether the grabber should be long or not, and whether to obey spaces. The `\l___cmd_obey_spaces_bool` boolean can only be `true` for trailing optional arguments. In that case spaces will not be ignored when looking for that optional argument.

```
821 \cs_new_protected:Npn \_\_cmd\_add\_grabber:N #1
822 {
823     \tl_put_right:Nx \l_\_\_cmd\_signature_tl
824     {
825         \exp_not:c
```

```

826         {
827             __cmd_grab_ #1
828             \bool_if:NT \l__cmd_long_bool { _long }
829             \bool_if:NT \l__cmd_obey_spaces_bool { _obey_spaces }
830             :w
831         }
832     }
833     \bool_set_false:N \l__cmd_long_bool
834     \bool_set_false:N \l__cmd_obey_spaces_bool
835     \tl_put_right:Nx \l__cmd_process_all_tl
836     {
837         {
838             \if_charcode:w E #1 \use_i:nn \fi:
839             \exp_not:o \l__cmd_process_one_tl
840         }
841     }
842     \tl_clear:N \l__cmd_process_one_tl
843 }

```

(End definition for `__cmd_add_grabber:N`.)

`__cmd_add_default:n`
`__cmd_add_default:`
`__cmd_add_default_E:nn` Store the default value of an argument, or rather code that gives that default value (it may involve other arguments). This is `\c_novalue_tl` for arguments with no actual default or with default `-NoValue-`; and (in a brace group) `\prg_do_nothing:` followed by a default value for others. For E-type arguments, pad the defaults `#2` with some `\c_novalue_tl` until there are as many as embellishments `#1`. These functions are also used when defining expandable commands.

```

844 \cs_new_protected:Npn \__cmd_add_default:n #1
845   {
846     \tl_if_novalue:nTF {#1}
847       { \__cmd_add_default: }
848       {
849           \int_incr:N \l__cmd_current_arg_int
850           \bool_set_true:N \l__cmd_defaults_bool
851           \tl_put_right:Nn \l__cmd_defaults_tl { { \prg_do_nothing: #1 } }
852       }
853   }
854 \cs_new_protected:Npn \__cmd_add_default:
855   {
856     \int_incr:N \l__cmd_current_arg_int
857     \tl_put_right:Nn \l__cmd_defaults_tl { \c_novalue_tl }
858   }
859 \cs_new_protected:Npn \__cmd_add_default_E:nn #1#2
860   {
861     \tl_map_function:nN {#2} \__cmd_add_default:n
862     \prg_replicate:nn
863       { \tl_count:n {#1} - \tl_count:n {#2} }
864       { \__cmd_add_default: }
865   }

```

(End definition for `__cmd_add_default:n`, `__cmd_add_default:`, and `__cmd_add_default_E:nn`.)

1.7 Setting up expandable types

The approach here is not dissimilar to that for standard types, but fewer types are supported. There is also a need to define the per-function auxiliaries: this is done here, while the general grabbers are dealt with later.

```
\_\_cmd\_add\_expandable\_type\_+:\w
We have already checked that short arguments are before long arguments, so \l\_\_cmd\_long\_bool only changes from false to true once (and there is no need to reset it after each argument). Continue the loop.
```

```
866 \cs_new_protected:cpn { __cmd_add_expandable_type_+:\w }
867   {
868     \bool_set_true:N \l\_\_cmd_long_bool
869     \_\_cmd_prepare_signature:N
870   }
```

(End definition for __cmd_add_expandable_type_+:\w.)

The set up for D-type arguments involves constructing a rather complex auxiliary which is used repeatedly when grabbing. There is an auxiliary here so that the R-type can share code readily: #1 is D or R. The `_aux:NN` auxiliary is needed if the two delimiting tokens are identical: in contrast to the non-expandable route, the grabber here has to act differently for this case.

```
871 \cs_new_protected:Npn \_\_cmd\_add\_expandable\_type\_D:\w
872   { __cmd_add_expandable_type_D_aux:NNNn D }
873 \cs_new_protected:Npn \_\_cmd\_add\_expandable\_type\_D\_aux:NNNn #1#2#3#4
874   {
875     \_\_cmd\_add\_default:n {#4}
876     \tl_if_eq:nnTF {#2} {#3}
877       { __cmd_add_expandable_type_D_aux:NN #1 #2 }
878       { __cmd_add_expandable_type_D_aux:NNN #1 #2 #3 }
879     \_\_cmd_prepare_signature:N
880   }
881 \cs_new_protected:Npn \_\_cmd\_add\_expandable\_type\_D\_aux:NNN #1#2#3
882   {
883     \bool_if:NTF \l\_\_cmd_long_bool
884       { \cs_set:cpx }
885       { \cs_set_nopar:cpx }
886       { \l\_\_cmd_expandable_aux_name_t1 } ##1 ##2 #2 ##3 \q\_\_cmd ##4 #3
887       { ##1 {##2} {##3} {##4} }
888     \_\_cmd\_add\_expandable\_grabber:nn {#1}
889     {
890       \exp_not:c { \l\_\_cmd_expandable_aux_name_t1 }
891       \exp_not:n { #2 #3 }
892     }
893   }
894 \cs_new_protected:Npn \_\_cmd\_add\_expandable\_type\_D\_aux:NN #1#2
895   {
896     \bool_if:NTF \l\_\_cmd_long_bool
897       { \cs_set:cpx }
898       { \cs_set_nopar:cpx }
899       { \l\_\_cmd_expandable_aux_name_t1 } ##1 #2 ##2 #2
900       { ##1 {##2} }
901     \_\_cmd\_add\_expandable\_grabber:nn { #1_alt }
902     {
```

```

903         \exp_not:c { \l__cmd_expandable_aux_name_tl }
904         \exp_not:n {#2}
905     }
906 }
```

(End definition for `__cmd_add_expandable_type_D:w` and others.)

```
\__cmd_add_expandable_type_E:w
\__cmd_add_expandable_type_E_aux:n
```

For each embellishment, use `__cmd_get_grabber>NN` to obtain an auxiliary delimited by that token and store a pair constituted of the auxiliary and the token in `\l__cmd_tmpb_t1`, before appending the whole set of these pairs to the signature, and an equal number of `-NoValue-` markers (regardless of the default values of arguments). Set the current argument appropriately.

```

907 \cs_new_protected:Npn \__cmd_add_expandable_type_E:w #1#2
908 {
909     \__cmd_add_default_E:nn {#1} {#2}
910     \tl_clear:N \l__cmd_tmpb_t1
911     \tl_map_function:nN {#1} \__cmd_add_expandable_type_E_aux:n
912     \__cmd_add_expandable_grabber:nn
913     { E \bool_if:NT \l__cmd_long_bool { _long } }
914     {
915         { \exp_not:o \l__cmd_tmpb_t1 }
916         {
917             \prg_replicate:nn { \tl_count:n {#1} }
918             { { \c_novalue_t1 } }
919         }
920     }
921     \__cmd_prepare_signature:N
922 }
923 \cs_new_protected:Npn \__cmd_add_expandable_type_E_aux:n #1
924 {
925     \__cmd_get_grabber:NN #1 \l__cmd_tmpa_t1
926     \tl_put_right:Nx \l__cmd_tmpb_t1
927     { \exp_not:o \l__cmd_tmpa_t1 \exp_not:N #1 }
928 }
```

(End definition for `__cmd_add_expandable_type_E:w` and `__cmd_add_expandable_type_E_aux:n`.)

```
\__cmd_add_expandable_type_m:w
```

Unlike the standard case, when working expandably each argument is always grabbed separately.

```

929 \cs_new_protected:Npn \__cmd_add_expandable_type_m:w
930 {
931     \__cmd_add_default:
932     \__cmd_add_expandable_grabber:nn
933     { m \bool_if:NT \l__cmd_long_bool { _long } } { }
934     \__cmd_prepare_signature:N
935 }
```

(End definition for `__cmd_add_expandable_type_m:w`.)

```
\__cmd_add_expandable_type_R:w
```

The R-type is very similar to the D-type argument, and so the same internals are used.

```

936 \cs_new_protected:Npn \__cmd_add_expandable_type_R:w
937 { \__cmd_add_expandable_type_D_aux:NNNn R }
```

(End definition for `__cmd_add_expandable_type_R:w`.)

__cmd_add_expandable_type_t:w An auxiliary delimited by #1 is built now. It will be used to test for the presence of that token.

```
938 \cs_new_protected:Npn \_\_cmd\_add\_expandable\_type\_t:w #1
939 {
940     \_\_cmd\_add\_default:
941     \_\_cmd\_get\_grabber:NN #1 \l_\_cmd\_tmpa_tl
942     \_\_cmd\_add\_expandable\_grabber:nn { t }
943     {
944         \exp_not:o \l_\_cmd\_tmpa_tl
945         \exp_not:N #1
946     }
947     \_\_cmd\_prepare\_signature:N
948 }
```

(End definition for __cmd_add_expandable_type_t:w.)

__cmd_add_expandable_grabber:nn This is called for all arguments to place the right grabber in the signature.

```
949 \cs_new_protected:Npn \_\_cmd\_add\_expandable\_grabber:nn #1#2
950 {
951     \tl_put_right:Nx \l_\_cmd\_signature_tl
952     { \exp_not:c { \_\_cmd\_expandable\_grab\_#1 :w } #2 }
953 }
```

(End definition for __cmd_add_expandable_grabber:nn.)

__cmd_get_grabber>NN Given a token #1, defines an expandable function delimited by that token and stores it in the token list #2. The function is named after the token, unless that function name is already taken by some other grabber (this can happen in the rare case where delimiters with different category codes are used in the same document): in that case use a global counter to get a unique name. Since the grabbers are not named after `xparse` commands they should not be used to get material from the input stream.

```
954 \cs_new_protected:Npn \_\_cmd\_get\_grabber>NN #1#2
955 {
956     \cs_set:Npn \_\_cmd\_tmp:w ##1 #1 {##1}

984   \__cmd_get_grabber_auxii:NN.)
```

1.7.1 Copying a command and its internal structure

```

983 \IfFileExists{2021/11/15}{\__cmd_copy:NN}%
984 \IfFileExists{}{\SupportNewCommandCopy-in-ltcmd}
```

Since the 2020-10-01 L^AT_EX 2_E release, support for copying, and showing the definition of, robust commands has been available, but the specifics of each command are implemented separately. Here we'll add support for copying and showing `ltcmd` definitions.

To fully support copying, we need two commands: a conditional to test if a command is in fact a `ltcmd` command, and another command to actually copy the command. The conditional is defined later as `__kernel_cmd_if_xparse:NTF`, so now to the copying: This macro just branches to the proper copying command by using `__cmd_cmd_type_cases:NnnnnF`. The copying command takes the names of the commands to be copied to and from, and the actual commands as its four arguments.

```

985 \cs_new_protected:Npn \__cmd_copy:NN #1 #2
986   {
987     \use:x
988     {
989       \int_set:Nn \tex_escapechar:D { 92 }
990       \exp_not:N \__cmd_cmd_type_cases:NnnnnF \exp_not:N #2
991       { \__cmd_copy_command:nNnN } % branch to \__cmd_copy_command:nNnN
992       { \__cmd_copy_expandable:nNnN } % branch to \__cmd_copy_expandable:nNnN
993       { \__cmd_copy_environment:nNnN } % branch to \__cmd_copy_environment:nNnN
994       { \__cmd_copy_environment_end:nNnN } % branch to \__cmd_copy_environment_end:nNnN
995       { \__cmd_cant_copy:nwn { non-ltcmd } } % branch to \__cmd_cant_copy:nwn
996       { \cs_to_str:N #1 } { \cs_to_str:N #2 }
997       \exp_not:N #1 \exp_not:N #2
998       \exp_not:N \__cmd_break_point:n { \cs_to_str:N #2 }
999       \int_set:Nn \tex_escapechar:D { \int_use:N \tex_escapechar:D }
1000     }
1001   }
1002 \cs_new_protected:Npn \__cmd_set_eq_if_exist:NN #1 #2
1003   { \cs_if_exist:NTF #2 { \cs_set_eq:NN } { \use_none:n } #1 #2 }
1004 \cs_generate_variant:Nn \__cmd_set_eq_if_exist:NN { cc }
```

An utility macro similar to `__cmd_bad_def:wn` to abort a command copy. Contrary to `__cmd_bad_def:wn` though, when this happens the issue is most likely internal, because the command was already (supposedly) correctly defined so it should be copyable. Hopefully this macro will never be used ever, but if it does, apologise and give the reason for the failure so the user can report.

```

1005 \cs_new_protected:Npn \__cmd_cant_copy:nwn #1 #2 \__cmd_break_point:n #3
1006   { \msg_error:nnnn { cmd } { copy-bug } { #1 } { #3 } }
1007 \msg_new:nnn { cmd } { copy-bug }
```

```

1008 {
1009   Error~while~copying~command~\iow_char:N\\#2:\\
1010   \str_case:nn {#1}
1011   {
1012     { non-ltcmd } { Command~is~not~a~valid~ltcmd~command. }
1013     { unknown-type } { Found~an~unknown~argument~type. }
1014     { invalid-end }
1015     { Target~command~is~not~named~\iow_char:N \\end<name>. }
1016   }
1017 }

```

And, of course, add `_kernel_cmd_if_xparse:NTF` and `_cmd_copy:NN` to `\@declarecommandcopylisthook`:

```

1018 \tl_gput_right:Nn \@declarecommandcopylisthook
1019   { { \_kernel_cmd_if_xparse:NTF \_cmd_copy:NN } }

```

(End definition for `_cmd_copy:NN`, `_cmd_set_eq_if_exist:NN`, and `_cmd_cant_copy:nwn`.)

`_cmd_copy_command:nnNN` `_cmd_copy_command:NnNNnnnn`

A normal (non-expandable) command has a pretty straightforward structure. Its definition is stored in `\⟨cmd⟩_code`, its defaults (if any) are stored in `\⟨cmd⟩_defaults`, and its top-level definition contains its signature, which can just be copied over. `_cmd_copy_command:nnNN` copies the command code and defaults, and then defines the top-level command using the auxiliary `_cmd_copy_command:NnNNnnnn`. This macro takes the signature of the command being copied from its top-level definition, and replaces the named bits with the new name.

```

1020 \cs_new_protected:Npn \_cmd_copy_command:nnNN #1 #2 #3 #4
1021   {
1022     \cs_set_eq:cc { #1 ~ code } { #2 ~ code }
1023     \_cmd_set_eq_if_exist:cc { #1 ~ defaults } { #2 ~ defaults }
1024     \cs_set_protected_nopar:Npx #3
1025     { \exp_after:wN \_cmd_copy_command:NnNNnnnn #4 {#1} }
1026   }
1027 \cs_new:Npn \_cmd_copy_command:NnNNnnnn #1 #2 #3 #4 #5 #6 #7 #8
1028   {
1029     #1 \exp_not:n { {#2} }
1030     \exp_not:c { #8 ~ } \exp_not:c { #8 ~ code }
1031     \exp_not:n { {#5} {#6} {#7} }
1032   }

```

(End definition for `_cmd_copy_command:nnNN` and `_cmd_copy_command:NnNNnnnn`.)

`_cmd_copy_expandable:nnNN` `_cmd_copy_expandable:NnNNNNnn`

An expandable command is slightly more complicated. Besides the `\⟨cmd⟩_code`, and `\⟨cmd⟩_defaults`, it also has an auxiliary `\⟨cmd⟩_l` for grabbing delimited arguments, and possibly another auxiliary `\⟨cmd⟩_ll`, if the command has both long and short arguments. Then, its signature also has several specific bits that are unique to that command; this is in contrast to non-expandable commands, which use a common set of parsing functions.

We start by copying the basics, then call `_cmd_copy_expandable_signature:NnNNNNnnnn` to parse the signature of the command and build up the modified copy in a temporary token list, then we call `_cmd_copy_expandable:NnNNNNnnn` that will copy the top-level definition of the command, with the proper internal renames.

```

1033 \cs_new_protected:Npn \_cmd_copy_expandable:nnNN #1 #2 #3 #4
1034   {
1035     \cs_set_eq:cc { #1 ~ code } { #2 ~ code }

```

```

1036   \__cmd_set_eq_if_exist:cc { #1 ~ } { #2 ~ }
1037   \__cmd_set_eq_if_exist:cc { #1 ~ \c_space_t1 } { #2 ~ \c_space_t1 }
1038   \__cmd_set_eq_if_exist:cc { #1 ~ defaults } { #2 ~ defaults }
1039   \exp_after:wN \__cmd_copy_expandable_signature:NnNNNNnnn #4 {#1} {#2}
1040   \cs_set_nopar:Npx #3
1041     { \exp_after:wN \__cmd_copy_expandable:NnNNNNnnn #4 {#1} {#2} }
1042   }
1043 \cs_new:Npn \__cmd_copy_expandable:NnNNNNnnn #1 #2 #3 #4 #5 #6 #7 #8 #9
1044   {
1045     \exp_not:N #1 \exp_not:n { {#2} }
1046     \exp_not:c { #8 ~ }
1047     \exp_not:c
1048     {
1049       #8 ~
1050       \str_if_eq:eeT
1051         { \exp_not:c { #9 ~ \c_space_t1 } } { \exp_not:N #4 }
1052         { \c_space_t1 }
1053     }
1054     \exp_not:c { #8 ~ code }
1055     \str_if_eq:eeTF { \exp_not:N #6 } { ? }
1056     { ? }
1057     { \exp_not:c { #8 ~ defaults } }
1058     { \exp_not:V \l__cmd_tmpa_t1 }
1059   }

```

A signature for an expandable command contains as many `\expandable_grab_<type>:w` as there are arguments, and what follows this macro depends on the `<type>`. We'll start a loop through the signature, and at each argument grabber, we'll step the argument count, and look for the `<type>` with `__cmd_copy_parse_grabber:w` so that we know which `__cmd_copy_grabber_<type>:w` to call next.

```

1060 \cs_new_protected:Npn \__cmd_copy_expandable_signature:NnNNNNnnn
1061   #1 #2 #3 #4 #5 #6 #7 #8 #9
1062   {
1063     \int_zero:N \l__cmd_current_arg_int
1064     \tl_clear:N \l__cmd_tmpa_t1
1065     \__cmd_copy_expandable:nnN {#8} {#9} #7
1066     \q_recursion_tail \q_recursion_stop
1067   }
1068 \cs_new_protected:Npn \__cmd_copy_expandable:nnN #1 #2 #3
1069   {
1070     \quark_if_recursion_tail_stop:n {#3}
1071     \int_incr:N \l__cmd_current_arg_int
1072     \exp_after:wN \__cmd_copy_parse_grabber:w \token_to_str:N #3 {#1} {#2}
1073   }
1074 \use:x
1075   {
1076     \cs_new_protected:Npn \exp_not:N \__cmd_copy_parse_grabber:w ##1
1077       \tl_to_str:n { expandable_grab_ } ##2 \tl_to_str:n { :w }
1078     {
1079       \tl_put_right:Nx \exp_not:N \l__cmd_tmpa_t1
1080         { \exp_not:N \exp_not:c { __cmd_expandable_grab_##2:w } }
1081         \exp_not:N \cs_if_exist_use:cF { __cmd_copy_grabber_##2:w }
1082           { \__cmd_cant_copy:nwn { unknown-type } }
1083     }

```

```
1084 }
```

The most complicated is the Delimited argument: each argument has a dedicated grabbing function named after the command that has to be copied over (of the form $\langle cmd \rangle \cup (\arg \cup num)$).

```
1085 \cs_new_protected:Npn \__cmd_copy_grabber_D:w #1 #2 #3 #4 #5
1086 {
1087     \tl_put_right:Nx \l__cmd_tmpa_tl
1088     {
1089         \exp_not:c { #1 ~ (arg ~ \int_use:N \l__cmd_current_arg_int ) }
1090         \exp_not:n { #4 #5 }
1091     }
1092     \cs_set_eq:cc
1093         { #1 ~ (arg ~ \int_use:N \l__cmd_current_arg_int ) }
1094         { #2 ~ (arg ~ \int_use:N \l__cmd_current_arg_int ) }
1095     \__cmd_copy_expandable:nnN {#1} {#2}
1096 }
```

D_alt is just a special case of D that uses a single delimiter (used when both delimiters of the argument are identical):

```
1097 \cs_new_protected:Npn \__cmd_copy_grabber_D_alt:w #1 #2 #3 #4
1098     { \__cmd_copy_grabber_D:w {#1} {#2} {#3} {#4} { } }
```

As far as copying is concerned, R is identical to D:

```
1099 \cs_new_eq:NN \__cmd_copy_grabber_R:w \__cmd_copy_grabber_D:w
1100 \cs_new_eq:NN \__cmd_copy_grabber_R_alt:w \__cmd_copy_grabber_D_alt:w
```

E is straightforward: we just copy the embellishments over, and increase the current argument number $\l__cmd_current_arg_int$ by the number of embellishments (minus one because there is a $\int_incr:N$ down the line).

```
1101 \cs_new_protected:Npn \__cmd_copy_grabber_E:w #1 #2 #3 #4
1102 {
1103     \tl_put_right:Nn \l__cmd_tmpa_tl { {#3} {#4} }
1104     \int_add:Nn \l__cmd_current_arg_int { \tl_count:n {#4} - 1 }
1105     \__cmd_copy_expandable:nnN {#1} {#2}
1106 }
1107 \cs_new_eq:NN \__cmd_copy_grabber_E_long:w \__cmd_copy_grabber_E:w
```

t just needs copying the token to be tested for:

```
1108 \cs_new_protected:Npn \__cmd_copy_grabber_t:w #1 #2 #3 #4
1109 {
1110     \tl_put_right:Nn \l__cmd_tmpa_tl { #3 #4 }
1111     \__cmd_copy_expandable:nnN {#1} {#2}
1112 }
```

And last but not least, m is the simplest; the grabber is just $__cmd_expandable_grab_m:w$, which is already added to the new command so here we just resume the loop:

```
1113 \cs_new_protected:Npn \__cmd_copy_grabber_m:w { \__cmd_copy_expandable:nnN }
1114 \cs_new_eq:NN \__cmd_copy_grabber_m_long:w \__cmd_copy_grabber_m:w
```

(End definition for $__cmd_copy_expandable:nnNN$ and others.)

```
\__cmd_copy_environment:nnNN
\__cmd_copy_environment:Nnnnnnn
```

Copying an environment's \begin part is pretty much like copying a command, except it has a longer name, and at the end we have to copy $\environment \langle name \rangle$ into $\langle name \rangle$.

```
1115 \cs_new_protected:Npn \__cmd_copy_environment:nnNN #1 #2 #3 #4
```

```

1116   {
1117     \cs_set_eq:cc { environment~ #1 ~ code } { environment~ #2 ~ code }
1118     \__cmd_set_eq_if_exist:cc
1119       { environment~ #1 ~ defaults } { environment~ #2 ~ defaults }
1120     \cs_set_protected_nopar:cpx { environment~ #1 }
1121       { \exp_after:wN \__cmd_copy_environment:Nnnnnnn #4 {#1} }
1122     \cs_set_eq:cc {#1} { environment~ #1 }
1123   }
1124 \cs_new:Npn \__cmd_copy_environment:Nnnnnnn #1 #2 #3 #4 #5 #6 #7
1125   { #1 \exp_not:n { {#2} } {#7} \exp_not:n { {#4} {#5} {#6} } }

```

(End definition for `__cmd_copy_environment:nnNN` and `__cmd_copy_environment:Nnnnnnn`.)

`__cmd_copy_environment_end:nnNN`
`__cmd_copy_environment_end_aux:nnNN`

Copying an environment's `\end` part is a bit trickier. We first have to make sure that both parts are named `\end<name>` (that's actually not a hard requirement, but an environment `\end` command makes no sense without the `end` in its name), and strip the leading `end` from the strings. After that, copying is straightforward.

```

1126 \cs_new_protected:Npn \__cmd_copy_environment_end:nnNN #1 #2
1127   {
1128     \__cmd_check_end:Nn \l__cmd_tmpa_tl {#1}
1129     \__cmd_check_end:Nn \l__cmd_tmpb_tl {#2}
1130     \exp_args:Nno \__cmd_copy_environment_end_aux:nnNN
1131       { \l__cmd_tmpa_tl } { \l__cmd_tmpb_tl }
1132   }
1133 \cs_new_protected:Npn \__cmd_copy_environment_end_aux:nnNN #1 #2 #3 #4
1134   {
1135     \cs_set_nopar:cp { environment~ #1 ~end }
1136       { \exp_not:c { environment~ #1 ~end~aux } }
1137     \cs_set_eq:cc
1138       { environment~ #1 ~end~aux~ } { environment~ #2 ~end~aux~ }
1139     \cs_set_eq:cc { end #1 } { environment~ #1 ~end }
1140   }

```

To check whether an `\end` command is valid, we look for the string `end` at the beginning of the command name, and if not found, raise an error:

```

\__cmd_check_end:Nn
\__cmd_check_end:n
\__cmd_check_end:w
1141 \cs_new_protected:Npn \__cmd_check_end:Nn #1 #2
1142   {
1143     \tl_set:Nx #1 { \__cmd_check_end:n {#2} }
1144     \token_if_eq_meaning:NNT #1 \q_nil
1145       { \__cmd_cant_copy:nwn { invalid-end } }
1146   }
1147 \cs_set_protected:Npn \__cmd_tmp:w #1
1148   {
1149     \cs_new:Npn \__cmd_check_end:n ##1
1150       {
1151         \exp_after:wN \__cmd_check_end:w \tl_to_str:n {##1}
1152           #1 \q_mark #1 \q_stop
1153       }
1154     \cs_new:Npn \__cmd_check_end:w ##1 #1 ##2 #1 ##3 \q_stop
1155       { \if_meaning:w ##2 \q_mark \exp_not:N \q_nil \else: ##2 \fi: }
1156   }
1157 \exp_args:No \__cmd_tmp:w { \tl_to_str:n { end } }

```

(End definition for `_cmd_copy_environment_end:nNN` and others.)

Not much to do regarding `\texrelease`: we could remove the entries from `\@declarecommandcopylist` but it doesn't seem worth it.

```
1158 <\texrelease> \EndIncludeInRelease  
1159 <\texrelease> \IncludeInRelease{2020/10/01}{\_cmd_copy:NN}%  
1160 <\texrelease> {Support~\NewCommandCopy~in~ltcmd}  
1161 <\texrelease> \EndIncludeInRelease
```

1.7.2 Showing the definition of a command

```
1162 <\texrelease> \IncludeInRelease{2021/11/15}{\_cmd_show:N}%  
1163 <\texrelease> {Support~\ShowCommand~in~ltcmd}
```

To show the definition of a command we need more or less the same building blocks as for copying, except that instead of making a copy, we'll just print stuff to the terminal. This macro just branches to the proper showing command by using `_cmd_cmd_type_cases:NnnnnF`. The showing command takes the command to be shown as argument.

```
1164 \cs_new_protected:Npn \_cmd_show:N #1  
1165 {  
1166     \use:x  
1167     {  
1168         \int_set:Nn \tex_escapechar:D { 92 }  
1169         \exp_not:N \_cmd_cmd_type_cases:NnnnnF \exp_not:N #1  
1170         { \_cmd_show_command:N }  
1171         { \_cmd_show_expandable:N }  
1172         { \_cmd_show_environment:N }  
1173         { \_cmd_show_environment_end:N }  
1174         { \_cmd_cant_copy:nwn { non-ltcmd } }  
1175         \exp_not:N #1  
1176         \exp_not:N \_cmd_break_point:n { \cs_to_str:N #1 }  
1177         \int_set:Nn \tex_escapechar:D { \int_use:N \tex_escapechar:D }  
1178     }  
1179 }
```

(End definition for `_cmd_show:N`.)

These commands just expand the command once to reveal its innards, then pass the type of command, the control sequence, the signature, and the code macro to `_cmd_show_command_aux:nNNn`.

```
1180 \cs_new_protected:Npn \_cmd_show_command:N #1  
1181 { \exp_after:wN \_cmd_show_command:NnNwN #1 \q_\cmd #1 }  
1182 \cs_new_protected:Npn \_cmd_show_command:NnNwN #1 #2 #3 #4 #5 \q_\cmd #6  
1183 { \_cmd_show_command_aux:nNNn { document~command } #6 #4 {#2} }  
1184 \cs_new_protected:Npn \_cmd_show_expandable:N #1  
1185 { \exp_after:wN \_cmd_show_expandable:NnNNNnN #1 #1 }  
1186 \cs_new_protected:Npn \_cmd_show_expandable:NnNNNnN #1 #2 #3 #4 #5 #6 #7 #8  
1187 { \_cmd_show_command_aux:nNNn { expandable~document~command } #8 #5 {#2} }
```

Now just print everything in the required format. The auxiliary `_cmd_split_signature:n` stores a ready-to-print token list in `\l_\cmd_tmpa_tl`, so we ust use that here:

```
1188 \cs_new_protected:Npn \_cmd_show_command_aux:nNNn #1 #2 #3 #4  
1189 {  
1190     \_cmd_split_signature:n {#4}
```

```

1191     \tl_show:x
1192     {
1193         \token_to_str:N #2 = #1: \iow_newline:
1194         \tl_use:N \l__cmd_tmpa_tl
1195         -> \cs_replacement_spec:N #3
1196     }
1197 }
```

We can reuse most of the above to show an environment, except that we need to ensure that the proper `\environment` ... are passed to `_cmd_show_command_aux:nNNn`. Additionally, when `\ShowCommand\foo` is used (if `\foo` is an environment), we show `\endfoo` as well, and when `\ShowCommand\endfoo` is used, change that to `\ShowCommand\foo` and do the same.

```

1198 \cs_new_protected:Npn \_cmd_show_environment:N #
1199 {
1200     \exp_after:wN \_cmd_show_environment:Nnnw #1 \q_ cmd
1201     \tl_show:x
1202     {
1203         \token_to_str:N \end { \cs_to_str:N #1 } : \iow_newline:
1204         -> \exp_args:Nc \cs_replacement_spec:N
1205         { environment~ \cs_to_str:N #1 ~end~aux~ }
1206     }
1207 }
1208 \cs_new_protected:Npn \_cmd_show_environment:Nnnw #1 #2 #3 #4 \q_ cmd
1209 {
1210     \use:x
1211     {
1212         \_cmd_show_command_aux:nNNn { document~environment }
1213         { \exp_not:N \begin {#3} }
1214         \exp_not:c { environment~ #3 ~ code }
1215         {#2}
1216     }
1217 }
1218 \cs_new_protected:Npn \_cmd_show_environment_end:N #
1219 {
1220     \exp_args:NNx \_cmd_check_end:Nn \l__cmd_tmpa_tl { \cs_to_str:N #1 }
1221     \exp_args:Nc \_cmd_show_environment:N { \l__cmd_tmpa_tl }
1222 }
```

And, of course, add `_kernel_cmd_if_xparse:NTF` and `_cmd_show:N` to `\@showcommandlisthook`

```

1223 \tl_gput_right:Nn \@showcommandlisthook
1224 { { \_kernel_cmd_if_xparse:NTF \_cmd_show:N } }
```

(End definition for `_cmd_show_command:N` and others.)

`_cmd_split_signature:n`

Now we'll try a least-effort adventure into splitting the symbolic user-provided signature for a command into individual parameters for pretty-printing. A counter is used to keep track of the current argument number, and two token lists are used: `\l__cmd_tmpa_tl` holds the final token list to be printed, and `\l__cmd_tmpb_tl` holds just the current item, so that we can make changes to an individual item without having to dissect the whole thing (this is used for e- and E-types).

```

1225 \cs_new_protected:Npn \_cmd_split_signature:n #
1226 {
1227     \int_set:Nn \l__cmd_current_arg_int { 1 }
```

```

1228      \tl_clear:N \l__cmd_tmpa_tl
1229      \tl_clear:N \l__cmd_tmpb_tl
1230      \__cmd_split_signature_loop:Nw #1 \q_recursion_tail \q_recursion_stop
1231  }

```

This is the main chunk of the loop: it starts an item with `__cmd_split_start_item:` (this adds indentation and the argument number to `\l__cmd_tmpb_tl`), then checks if a special token list `\c__cmd_show_type_{type}_tl` exists. If it doesn't, the current argument is a "simple" type which needs no extra processing. Otherwise, call a specific function depending on the value of said token list.

```

1232 \cs_new_protected:Npn \__cmd_split_signature_loop:Nw #1
1233 {
1234   \quark_if_recursion_tail_stop:N #1
1235   \tl_if_empty:NT \l__cmd_tmpb_tl { \__cmd_split_start_item: }
1236   \tl_if_exist:cTF { \c__cmd_show_type_#1_tl }
1237   {
1238     \use:c
1239     {
1240       \__cmd_show_
1241       \if_case:w \tl_use:c { \c__cmd_show_type_#1_tl } \exp_stop_f:
1242       delim \or: delims \or: delims_opt \or: opt \or:
1243       e \or: E \or: prefix \or: processor \fi: :Nw
1244     } #1
1245   }
1246   { \__cmd_split_end_item:n {#1} \__cmd_split_signature_loop:Nw }
1247 }

```

The token lists `\c__cmd_show_type_{type}_tl` exist for nontrivial (for printing) `{types}` that require special parsing (like delimiters or optional arguments). Values from 0 to 7 are assigned to each type:

1. a single delimiter token;
2. two delimiter tokens;
3. two delimiter tokens plus a default value;
4. a default value;
5. a list of embellishments (exclusive for e-type);
6. embellishments plus defaults (exclusive for E-type);
7. simple prefixes;
8. prefixes with arguments (argument processors);

```

1248 \cs_set_protected:Npn \__cmd_tmp:w #1 #2
1249 {
1250   \quark_if_nil:nF {#1}
1251   { \tl_const:cn { \c__cmd_show_type_#1_tl } {#2} \__cmd_tmp:w }
1252 }
1253 \__cmd_tmp:w t0 r1 d1 R2 D2 03 e4 E5 +6 !6 >7 \q_nil \q_nil

```

Now, based on each type we know how to act. In most cases it is just a matter of feeding in the grabbed arguments and resuming the loop. The embellishments require a bit more attention: the e-type loops through the list of embellishments and adds each to the token list as a separate argument. The E-type does more or less the same, but uses `__cmd_tl_mapthread_function:nnN` to map over two lists simultaneously, adding each token and default to the token list for printing.

```

1254 \cs_new_protected:Npn \__cmd_show_delim:Nw #1 #2
1255   { \__cmd_split_end_item:n { #1 #2 } \__cmd_split_signature_loop:Nw }
1256 \cs_new_protected:Npn \__cmd_show_delims:Nw #1 #2 #3
1257   { \__cmd_split_end_item:n { #1 #2 #3 } \__cmd_split_signature_loop:Nw }
1258 \cs_new_protected:Npn \__cmd_show_delims_opt:Nw #1 #2 #3 #4
1259   { \__cmd_split_end_item:n { #1 #2 #3 {#4} } \__cmd_split_signature_loop:Nw }
1260 \cs_new_protected:Npn \__cmd_show_opt:Nw #1 #2
1261   { \__cmd_split_end_item:n { #1 {#2} } \__cmd_split_signature_loop:Nw }
1262 \cs_new_protected:Npn \__cmd_show_e:Nw #1 #2
1263   {
1264     \tl_map_inline:nn {#2}
1265   {
1266     \__cmd_split_start_item:
1267     \__cmd_split_end_item:n { #1 ##1 }
1268   }
1269   \__cmd_split_signature_loop:Nw
1270 }
1271 \cs_set_protected:Npn \__cmd_tmp:w #1
1272   {
1273     \cs_new_protected:Npn \__cmd_show_E:Nw ##1 ##2 ##3
1274   {
1275     \cs_set_protected:Npn \__cmd_tmp:w #####1 #####2
1276   {
1277     \__cmd_split_start_item:
1278     \__cmd_split_end_item:n { ##1 #####1 #####2 }
1279   }
1280   \__cmd_tl_mapthread_function:nnN {##2}
1281   { ##3 {#1} {#1} {#1} {#1} {#1} {#1} {#1} {#1} } \__cmd_tmp:w
1282   \__cmd_split_signature_loop:Nw
1283 }
1284 }
1285 \exp_args:NV \__cmd_tmp:w \c_novalue_tl

```

Minor wrinkle with the prefixes: they use `__cmd_split_add_item:n` instead of `__cmd_split_end_item:n` (add *vs.* end) because they are followed by an argument, so they can't end the item.

```

1286 \cs_new_protected:Npn \__cmd_show_prefix:Nw #
1287   { \__cmd_split_add_item:n {#1} \__cmd_split_signature_loop:Nw }
1288 \cs_new_protected:Npn \__cmd_show_processor:Nw #1 #2
1289   { \__cmd_split_add_item:n { #1 {#2} } \__cmd_split_signature_loop:Nw }

```

And now the auxiliaries that store the strings to be printed. `__cmd_split_start_item:` starts an item from scratch, `__cmd_split_add_item:n` adds tokens to an item without adding a newline, and `__cmd_split_end_item:n` adds tokens, terminates the item with a newline, and steps the argument count.

```

1290 \cs_new_protected:Npn \__cmd_split_start_item:
1291   {

```

```

1292     \tl_set:Nx \l__cmd_tmpb_tl
1293     { ~ \c_space_tl \c_hash_str \int_use:N \l__cmd_current_arg_int : }
1294   }
1295 \cs_new_protected:Npn \__cmd_split_add_item:n #1
1296 { \tl_put_right:Nx \l__cmd_tmpb_tl { \tl_to_str:n {#1} } }
1297 \cs_new_protected:Npn \__cmd_split_end_item:n #1
1298 {
1299   \tl_put_right:Nx \l__cmd_tmpa_tl
1300   { \l__cmd_tmpb_tl \tl_to_str:n {#1} \iow_newline: }
1301   \tl_clear:N \l__cmd_tmpb_tl
1302   \int_incr:N \l__cmd_current_arg_int
1303 }

```

(End definition for `__cmd_split_signature:n` and others.)

Not much to do regarding `\textralatexrelease`: we could remove the entries from `\@showcommandlisthook`, but it doesn't seem worth it.

```

1304 \textralatexrelease\EndIncludeInRelease
1305 %
1306 \textralatexrelease\IncludeInRelease{2020/10/01}{\__cmd_show:N}%
1307 \textralatexrelease\{Support~\ShowCommand~in~\ltcmd}
1308 \textralatexrelease\EndIncludeInRelease

```

1.8 Grabbing arguments

All of the grabbers follow the same basic pattern. The initial function stores in `\l__cmd_signature_tl` the code to grab further arguments, defines (the function in) `\l__cmd_fn_tl` that will grab the argument, and calls it.

Defining `\l__cmd_fn_tl` means determining whether to use `\cs_set:Npn` or `\cs_set_nopar:Npn`, and for optional arguments whether to skip spaces. Once the argument is found, `\l__cmd_fn_tl` calls `__cmd_add_arg:n`, responsible for calling processors and grabbing further arguments.

```

\__cmd_grab_b:w
\__cmd_grab_b_long:w
\__cmd_grab_b_obey_spaces:w
\__cmd_grab_b_long_obey_spaces:w
\__cmd_grab_b_aux:NNw
\__cmd_grab_b_end:Nw

```

This uses the well-tested code of D-type arguments, skipping the peeking step because the b-type argument is always present, and adding a cleanup stage at the end by hijacking the signature. The clean-up consists of properly dealing with `\l__cmd_args_tl` and also putting back the `\end` that served as an end-delimiter: this `\end` receives the environment name as its argument and is run normally. The D-type code stores the argument found (body of the environment) as a brace group in `\l__cmd_args_tl` and depending on the presence of a prefix ! we trim spaces or not before adding this braced argument into the saved `\l__cmd_args_tl`. The strange `\begin_` control sequence is there for display purposes only: it has to look like `\begin` in the terminal but not to delimited arguments.

```

1309 \cs_new_protected:Npn \__cmd_grab_b:w
1310 { \__cmd_grab_b_aux:NNw \cs_set_protected_nopar:Npn \tl_trim_spaces:n }

1354     \__cmd_peek_meaning_remove:NTF
1355 }

```

This is a bit complicated. The idea is that, in order to check for nested optional argument tokens ([[[...]]] and so on) the argument needs to be grabbed without removing any braces at all. If this is not done, then cases like [{[]}] fail. So after testing for an optional argument, it is collected piece-wise. Inserting a quark prevents loss of braces, and there is then a test to see if there are nested delimiters to handle.

```

\__cmd_grab_D_aux:NNnNN
\__cmd_grab_D_aux:NNnN
1356 \cs_new_protected:Npn \__cmd_grab_D_aux:NNnNN #1#2#3#4#5
1357 {
1358     \__cmd_grab_D_aux:NNnN #1#2 {#3} #4
1359     #5 #1
1360     { \__cmd_grab_D_call:Nw #1 }
1361     { \__cmd_add_arg:o \c_novalue_tl }

```

```
1362 }
```

Inside the “standard” grabber, there is a test to see if the grabbed argument is entirely enclosed by braces. There are a couple of extra factors to allow for: the argument might be entirely empty, and spaces at the start and end of the input must be retained around a brace group. Also notice that a *blank* argument might still contain spaces.

```
1363 \cs_new_protected:Npn \__cmd_grab_D_aux:NNnN #1#2#3#4
1364 {
1365   \tl_set:Nn \l__cmd_signature_tl {#3}

1379       }
1380     }
1381   }
1382 }
```

(End definition for `__cmd_grab_D:w` and others.)

```
\__cmd_grab_D_nested:NNnN
\__cmd_grab_D_nested:w
\l__cmd_nesting_a_tl
\l__cmd_nesting_b_tl
\q__cmd
```

Catching nested optional arguments means more work. The aim here is to collect up each pair of optional tokens without TeX helping out, and without counting anything. The code above will already have removed the leading opening token and a closing token, but the wrong one. The aim is then to work through the material grabbed so far and divide it up on each opening token, grabbing a closing token to match (thus working in pairs). Once there are no opening tokens, then there is a second check to see if there are any opening tokens in the second part of the argument (for things like `[] []`). Once everything has been found, the entire collected material is added to the output as a single argument. The only tricky part here is ensuring that any grabbing function that might run away is named after the function currently being parsed and not after `xparse`. That leads to some rather complex nesting! There is also a need to prevent the loss of any braces, hence the insertion and removal of quarks along the way.

```

```

__cmd_grab_D_call:Nw For D and R-type arguments, to avoid losing any braces, a token needs to be inserted before the argument to be grabbed. If the argument runs away because the closing token is missing then this inserted token shows up in the terminal. Ideally, #1 would therefore be used directly, but that is no good as it will mess up the rest of the grabber. Instead, a copy of #1 with an altered category code is used, as this will look right in the terminal but will not mess up the grabber. The only issue then is that the category code of #1 is unknown. So there is a quick test to ensure that the inserted token can never be matched by the grabber. (This assumes that the open and close delimiters are not the same character with different category codes, but that really should not happen in any sensible document-level syntax.) An exception is when #1 is a control sequence token, in which case the character-token treatment is no good because if hit with \token_to_str:N it would add sputios tokens to the argument. In this case a different branch is taken. The token inserted is then the same *<csname>* as #1, but with a space appended, so that the grabber don't see it as another of the same delimiter.

```

`\l__cmd_v_arg_tl`

`\l__cmd_v_arg_tl`

```

\__cmd_grab_v:w
\__cmd_grab_v_long:w
\__cmd_grab_v_aux:w
\__cmd_grab_v_group_end:

```

The opening delimiter is the first non-space token, and is never read verbatim. This is required by consistency with the case where the preceding argument was optional and absent: then TeX has already read and tokenized that token when looking for the optional argument. The first thing is thus to check is that this delimiter is a character, and to distinguish the case of a left brace (in that case, `\group_align_safe_end:` is needed to compensate for the begin-group character that was just seen). Then set verbatim catcodes with `__cmd_grab_v_aux_catcodes:`.

The group keep catcode changes local, and `\group_align_safe_begin/end:` allow to use a character with category code 4 (normally `&`) as the delimiter (all commands do `\group_align_safe_begin/end:`, so there's no need to do that again here). It is

ended by `__cmd_grab_v_group_end`, which smuggles the collected argument out of the group.

`__cmd_grab_v_aux_test:N` Check that the opening delimiter is a character, setup category codes, then start reading tokens one by one, keeping the delimiter as an argument. If the verbatim was not nested, we will be grabbing one character at each step. Unfortunately, it can happen that what follows the verbatim argument is already tokenized. Thus, we check at each step that the next token is indeed a “nice” character, *i.e.*, is not a character with category code 1 (begin-group), 2 (end-group) or 6 (macro parameter), nor the space character, with category code 10 and character code 32, nor a control sequence. The partially built argument is stored in `\l__cmd_v_arg_tl`. If we ever meet a token which we cannot grab (non-N-type), or which is not a character according to `__cmd_grab_v_token_if_char:NTF`, then we bail out with `__cmd_grab_v_aux_abort:n`. Otherwise, we stop at the first character matching the delimiter.

`\l__cmd_v_nesting_int` 1671 `\int_new:N \l__cmd_v_nesting_int`

`__cmd_grab_v_bgroup:` If the opening delimiter is a left brace, we keep track of how many left and right braces were encountered so far in `\l__cmd_v_nesting_int` (the methods used for optional arguments cannot apply here), and stop as soon as it reaches 0.

Some care was needed when removing the opening delimiter, which has already been assigned category code 1: using `\peek_meaning_remove:NTF` in the `__cmd_grab_v_aux:w` function would break within alignments. Instead, we first convert that token to a string, and remove the result as a normal undelimited argument.

```

`__cmd_grab_v_aux_catcodes:` `__cmd_grab_v_aux_abort:n`

The approach for short verbatim arguments is to make the end-line character a macro parameter character: this is forbidden by the rest of the code. Then the error branch can check what caused the bail out and give the appropriate error message.

```

1743     }
1744 }

```

(End definition for `__cmd_grab_v_aux_put:N.`)

`__cmd_grab_v_token_if_char:NTF` This function assumes that the escape character is printable. Then the string representation of control sequences is at least two characters, and `\str_tail:n` only removes the escape character. Macro parameter characters are doubled by `\tl_to_str:n`, and will also yield a non-empty result, hence are not considered as characters.

```

1745 \cs_new_protected:Npn \__cmd_grab_v_token_if_char:NTF #1
1746 { \str_if_eq:eeTF { } { \str_tail:n {#1} } }

```

(End definition for `__cmd_grab_v_token_if_char:NTF.`)

`__cmd_add_arg:n` When an argument is found it is stored, then further arguments are grabbed by calling `\l__cmd_signature_tl`.

```

1747 \cs_new_protected:Npn \__cmd_add_arg:n #1
1748 {
1749     \tl_put_right:Nn \l__cmd_args_tl { {#1} }
1750     \l__cmd_signature_tl \__cmd_run_code:
1751 }
1752 \cs_generate_variant:Nn \__cmd_add_arg:n { V , o , x }

```

(End definition for `__cmd_add_arg:n.`)

1.9 Grabbing arguments expandably

The first step is to grab the first token or group. The generic grabbers $\backslash\langle function\rangle_{\sqcup}$ and $\backslash\langle function\rangle_{\sqcup}$ are just after $\backslash q_cmd$, we go and find them (and use the long one).

```
1753 \cs_new:Npn \__cmd_expandable_grab_D:w #1 \q_cmd #2#3
1754 { #2 { \__cmd_expandable_grab_D:NNNwNNn #1 \q_cmd #2 #3 } }
```

We then wish to test whether #7, which we just grabbed, is exactly #2. A preliminary test is whether their string representations coincide, then expand the only grabber function we have, #1, once: the two strings below are equal if and only if #7 matches #2 exactly.² The preliminary test is needed as #7 could validly contain $\backslash par$ (because a later mandatory argument could be long) and our grabber may be short. If #7 does not match #2, then the optional argument is missing, we use the default $-NoValue-$, and put back the argument #7 in the input stream.

If it does match, then interesting things need to be done. We will grab the argument piece by piece, with the following pattern:

```
<grabber> {<tokens>}
\q_nil {<piece 1>} <piece 2> \ERROR \q_cmd
\q_nil <input stream>
```

The *<grabber>* will find an opening delimiter in *<piece 2>*, take the $\backslash q_cmd$ as a second delimiter, and find more material delimited by the closing delimiter in the *<input stream>*. We then move the part before the opening delimiter from *<piece 2>* to *<piece 1>*, and the material taken from the *<input stream>* to the *<piece 2>*. Thus, the argument moves gradually from the *<input stream>* to the *<piece 2>*, then to the *<piece 1>* when we have made sure to find all opening and closing delimiters. This two-step process ensures that nesting works: the number of opening delimiters minus closing delimiters in *<piece 1>* is always equal to the number of closing delimiters in *<piece 2>*. We stop grabbing arguments once the *<piece 2>* contains no opening delimiter any more, hence the balance is reached, and the final argument is *<piece 1>* *<piece 2>*. The indirection via $\backslash__cmd_tmp:w$ allows to insert $-NoValue-$ expanded.

```
1755 \cs_set_protected:Npn \__cmd_tmp:w #1
1756 {
1757     \cs_new:Npn \__cmd_expandable_grab_D:NNNwNNn ##1##2##3##4 \q_cmd ##5##6##7
1758     {
1759         \str_if_eq:nnTF {##2} {##7}
1760         {
1761             \str_if_eq:onTF
1762             { ##1 { } { } ##7 ##2 \q_cmd ##3 }
1763             { { } {##2} { } }
1764         }
1765         { \use_i:nn }
1766     {
1767         ##1
1768         { \__cmd_expandable_grab_D:NNNwNNnn ##1##2##3##4 \q_cmd ##5##6 }
```

²It is obvious that if #7 matches #2 then the strings are equal. We must check the converse. The right-hand-side of $\backslash str_if_eq:onTF$ does not end with #3, implying that the grabber function took everything as its arguments. The first brace group can only be empty if #7 starts with #2, otherwise the brace group preceding #7 would not vanish. The third brace group is empty, thus the $\backslash q_cmd$ that was used by our grabber #1 must be the one that we inserted (not some token in #7), hence the second brace group contains the end of #7 followed by #2. Since this is #2 on the right-hand-side, and no brace can be lost there, #7 must contain nothing else than its leading #2.

```

1769         \q_nil { } ##2 \ERROR \q__cmd \ERROR
1770     }
1771     { ##4 {#1} \q__cmd ##5 ##6 {##7} }
1772   }
1773 }
1774 \exp_args:No \__cmd_tmp:w { \c_novalue_t1 }

At this stage, #7 is  $\q_\text{nil} \{ \langle \text{piece 1} \rangle \} \langle \text{more for piece 1} \rangle$ , and we want to concatenate all that, removing  $\q_\text{nil}$ , and keeping the opening delimiter #2. Simply use  $\use_{\text{ii:nn}}$ . Also, #8 is  $\langle \text{remainder of piece 2} \rangle \text{\ERROR}$ , and #9 is  $\text{\ERROR} \langle \text{more for piece 2} \rangle$ . We concatenate those, replacing the two  $\text{\ERROR}$  by the closing delimiter #3.

```

```

1775 \cs_new:Npn \__cmd_expandable_grab_D:NNNwNNnnn #1#2#3#4 \q__cmd #5#6#7#8#9
1776 {
1777   \exp_args:Nof \__cmd_expandable_grab_D:nnNNNwNN
1778   { \use_{\text{ii:nn}} #7 #2 }
1779   { \__cmd_expandable_grab_D:Nw #3 \exp_stop_f: #8 #9 }
1780   #1#2#3 #4 \q__cmd #5 #6
1781 }
1782 \cs_new:Npn \__cmd_expandable_grab_D:Nw #1#2 \ERROR \ERROR { #2 #1 }

Armed with our two new  $\langle \text{pieces} \rangle$ , we are ready to loop. However, we must first see if  $\langle \text{piece 2} \rangle$  (here #2) contains any opening delimiter #4. Again, we expand #3, this time removing its whole output with  $\use_{\text{none:nnn}}$ . The test is similar to  $\text{\tl_if_in:nnTF}$ . The token list is empty if and only if #2 does not contain the opening delimiter. In that case, we are done, and put the argument (from which we remove a spurious pair of delimiters coming from how we started the loop). Otherwise, we go back to looping with  $\text{\__cmd_expandable_grab_D:NNNwNNnnn}$ . The code to deal with brace stripping is much the same as for the non-expandable case.

```

```

  \__cmd_expandable_grab_E_find:w
  \__cmd_expandable_grab_E_find:nnw
  \__cmd_expandable_grab_E_end:nnw

```

We keep track of long/short by placing the appropriate grabber as the third token after `\q__cmd`; it is eventually removed by the `end:nnw` auxiliary. The `aux:w` auxiliary will be called repeatedly with two arguments: the set of pairs $\langle parser \rangle \langle token \rangle$, and the set of arguments found so far (initially all $\{-\text{NoValue}-\}$). At each step, grab what follows in the input stream then call the `loop:nnnNNw` auxiliary to compare it with each possible embellishment in turn. This auxiliary's #1 is what was found in the input, #2 collects $\langle parser \rangle \langle token \rangle$ pairs that did not match, #3 collects the corresponding arguments found previously, #4 and #5 is the current pair, #6 is the remaining pairs, #7 is empty or two `\q_nil`, and #8 is the current argument. If none of the pairs matched (determined by `\quark_if_nil:NTF`) then call the `end` auxiliary to stop looking for embellishments, remembering to put what was grabbed in the input back where it belongs, and storing

the arguments found just before `\q__cmd`. If the current argument #8 is not `-NoValue-` or if the input #1 does not match #5 (see t-type arguments below for a similar `\str_if_eq:onTF` test) then carry on the loop. Otherwise, we found a new embellishment: grab the corresponding argument in the input using the `find:w` auxiliary. To avoid losing braces around that auxiliary's argument we include a space, which will be eliminated in the next loop through embellishments.

```

```

2034     \tl_set:Nn \l__cmd_fn_tl {#1}
2035     \__cmd_get_arg_spec_error_aux:n { \cs_if_exist:NTF #1 }
2036   }
2037 \cs_new_protected:Npn \__cmd_get_arg_spec_error:n #1
2038   {
2039     \bool_set_true:N \l__cmd_environment_bool
2040     \str_set:Nx \l__cmd_environment_str {#1}
2041     \__cmd_get_arg_spec_error_aux:n
2042       { \cs_if_exist:cTF { \l__cmd_environment_str } }
2043   }
2044 \cs_new_protected:Npn \__cmd_get_arg_spec_error_aux:n #1
2045   {
2046     #1
2047   {
2048     \msg_error:nnx { cmd } { non-xparse }
2049       { \__cmd_environment_or_command: }
2050   }
2051   {
2052     \msg_error:nnx { cmd } { unknown }
2053       { \__cmd_environment_or_command: }
2054   }
2055 }
```

(End definition for __cmd_get_arg_spec_error:N, __cmd_get_arg_spec_error:n, and __cmd_get_arg_spec_error_aux:n.)

__cmd_get_arg_spec:NTF If the command is not an `xparse` command, complain. If it is, its second “item” is the argument specification.

```

2056 \cs_new_protected:Npn \__cmd_get_arg_spec:NTF #1#2#3
2057   {
2058     \__kernel_cmd_if_xparse:NTF #1
2059   {
2060     \tl_set:Nx \ArgumentSpecification { \tl_item:Nn #1 { 2 } }
2061     #2
2062   }
2063   {#3}
2064 }
```

(End definition for __cmd_get_arg_spec:NTF.)

Rolling forward from 2020-10-01 is tricky because the entire `ltcmd` module is new, but the user-level commands have the same name, so only these will clash. To work around that, in `latexrelease` mode we will (temporarily) disable `__kernel_chk_if_free_cs:N` for this final part of the code, then restore at the end.

```

2065 <|latexrelease>\cs_new_eq:NN \__cmd_chk_if_free_cs:N \__kernel_chk_if_free_cs:N
2066 <|latexrelease>\cs_gset_eq:NN \__kernel_chk_if_free_cs:N \use_none:n
```

\ArgumentSpecification 2067 \tl_new:N \ArgumentSpecification

__cmd_get_arg_spec:N Recovering the argument specification is now trivial.

```

2068 \cs_new_protected:Npn \__cmd_get_arg_spec:N #1
2069   {
2070     \__cmd_get_arg_spec:NTF #1 { }
```

```

2071      { \__cmd_get_arg_spec_error:N #1 }
2072  }
2073 \cs_new_protected:Npn \__cmd_get_arg_spec:n #1
2074  {
2075      \exp_args:Nc \__cmd_get_arg_spec:NTF
2076      { environment~ \tl_to_str:n {#1} }
2077      { }
2078      { \__cmd_get_arg_spec_error:n {#1} }
2079  }

```

(End definition for `__cmd_get_arg_spec:N` and `__cmd_get_arg_spec:n`.)

`__cmd_show_arg_spec:N` Showing the argument specification simply means finding it and then calling the `\tl_show:N` function.

```

2080 \cs_new_protected:Npn \__cmd_show_arg_spec:N #1
2081  {
2082      \__cmd_get_arg_spec:NTF #1
2083      { \tl_show:N \ArgumentSpecification }
2084      { \__cmd_get_arg_spec_error:N #1 }
2085  }
2086 \cs_new_protected:Npn \__cmd_show_arg_spec:n #1
2087  {
2088      \exp_args:Nc \__cmd_get_arg_spec:NTF
2089      { environment~ \tl_to_str:n {#1} }
2090      { \tl_show:N \ArgumentSpecification }
2091      { \__cmd_get_arg_spec_error:n {#1} }
2092  }

```

(End definition for `__cmd_show_arg_spec:N` and `__cmd_show_arg_spec:n`.)

1.12 Utilities

`__cmd_check_definable:nNT` Check that a token list is appropriate as a first argument of `\NewDocumentCommand` and similar functions and otherwise produce an error. First trim whitespace to allow for spaces around the actual command to be defined. If the result has multiple tokens, it is not a valid argument. The single token is a control sequence exactly if its string representation has more than one character (using `\token_to_str:N` rather than `\tl_to_str:n` to avoid problems with macro parameter characters, and setting `\tex_escapechar:D` to prevent it from being non-printable). Finally, check for an active character: this is done by lowercasing the token to fix its character code (arbitrarily to that of `?`) and comparing the result to an active `?`. Both control sequences and active characters are valid arguments, and non-active character tokens are not. In all cases, the group opened to keep assignments local must be closed.

```

2093 \cs_new_protected:Npn \__cmd_check_definable:nNT #1
2094  { \tl_trim_spaces_apply:nN {#1} \__cmd_check_definable_aux:nN }
2095 \group_begin:
2096  \char_set_catcode_active:n { ‘? ’ }

2122 }
2123 }
2124 \group_end:

```

(End definition for `_cmd_check_definable:nNT` and `_cmd_check_definable_aux:nN.`)

`_cmd_token_if_cs:NTF` Based on the definition of `_cmd_check_definable_aux:nN` above, but only checks for an actual control sequence (*i.e.*, `\langle anything \rangle`). `\tex_escapechar:D` is temporarily changed to a known value and then it checks if `\string#1` contains more than one character: if it does, it's a control sequence. This test differs from `\token_if_cs:NTF` for example in `\token_if_cs:NTF \c_group_begin_token {T}{F}`, where `\token_if_-cs:NTF` returns false.

```

2125 \cs_new_protected:Npn \__cmd_token_if_cs:NTF #1
2126 {
2127     \group_begin:
2128     \int_set:Nn \tex_escapechar:D { 92 }

`_cmd_peek_nonspace_aux:nNNTF.`)

`_cmd_peek_meaning:NTF` Peek ahead for a token with a given meaning. In case the search token is a control sequence, also check that the `<csname>` is the same as the control sequence peeked at. This extra verification is necessary when the command is delimited by control sequence tokens (as opposed to character tokens), and we want the exact same control sequence to match.

```

1.14 User functions

The user functions are more or less just the internal functions renamed.

\BooleanFalse Design-space names for the Boolean values.

```

2495 \cs_new_eq:NN \BooleanFalse \c_false_bool
2496 \cs_new_eq:NN \BooleanTrue \c_true_bool

```

(End definition for \BooleanFalse and \BooleanTrue.)

\NewDocumentCommand The user macros are pretty simple wrappers around the internal ones. There is however a check that the first argument is a single token, possibly surrounded by spaces (hence the strange \use:nnn), and is definable.

```

2497 \cs_new_protected:Npn \NewDocumentCommand #1#2#3
2498 {
2499   \__cmd_check_definable:nNT {#1} \NewDocumentCommand
2500   {
2501     \cs_if_exist:NTF #1

2549 \cs_new_protected:Npn \ProvideDocumentEnvironment #1#2#3#4
2550   { \cs_if_exist:cF {#1} { \__cmd_declare_env:nnnn {#1} {#2} {#3} {#4} } }
2551 \cs_new_protected:Npn \DeclareDocumentEnvironment #1#2#3#4
2552   { \__cmd_declare_env:nnnn {#1} {#2} {#3} {#4} }

```

(End definition for `\NewDocumentEnvironment` and others.)

`\NewExpandableDocumentCommand`

The expandable versions are essentially the same as the basic functions. The strange `\use:nnn` is there in case #1 is surrounded with spaces, as can happen with usual document catcodes in `\RenewExpandableDocumentCommand { ! }` ...

```

2553 \cs_new_protected:Npn \NewExpandableDocumentCommand #1#2#3
2554   {
2555     \__cmd_check_definable:nNT {#1} \NewExpandableDocumentCommand
2556     {
2557       \cs_if_exist:NTF #1
2558       {
2559         \msg_error:nnxx { cmd } { already-defined }
2560         { \use:nnn \token_to_str:N #1 { } }
2561         { \token_to_str:N \NewExpandableDocumentCommand }
2562       }
2563       { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }

```

```

2564     }
2565   }
2566 \cs_new_protected:Npn \RenewExpandableDocumentCommand #1#2#3
2567 {
2568   \__cmd_check_definable:nNT {#1} \RenewExpandableDocumentCommand
2569   {
2570     \cs_if_exist:NTF #1
2571     { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2572     {
2573       \msg_error:nnxx { cmd } { undefined }
2574       { \use:n \token_to_str:N #1 { } }
2575       { \token_to_str:N \RenewExpandableDocumentCommand }
2576     }
2577   }
2578 }
2579 \cs_new_protected:Npn \ProvideExpandableDocumentCommand #1#2#3
2580 {
2581   \__cmd_check_definable:nNT {#1} \ProvideExpandableDocumentCommand
2582   {
2583     \cs_if_exist:NF #1
2584     { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2585   }
2586 }
2587 \cs_new_protected:Npn \DeclareExpandableDocumentCommand #1#2#3
2588 {
2589   \__cmd_check_definable:nNT {#1} \DeclareExpandableDocumentCommand
2590   { \__cmd_declare_expandable_cmd:Nnn #1 {#2} {#3} }
2591 }

```

(End definition for `\NewExpandableDocumentCommand` and others.)

`\IfBooleanT` The logical `<true>` and `<false>` statements are just the normal `\c_true_bool` and `\c_false_bool` so `\bool_if:NTF` is almost enough. However, this code-level function blows up badly when passed invalid input. We want `\IfBooleanTF` to accept a single (non-space) token equal to `\c_true_bool` or `\c_false_bool`, possibly surrounded by spaces. If the input is blank or multiple items, jump to the error and pick the false branch. If the input, ignoring spaces (we do this by omitting braces in the `\tl_if_single_token:nF` test), is not a single token then jump to the error as well. It is then safe to compare the token to the two booleans, picking the appropriate branch. If neither matches, we jump to the error as well.

```

2592 \cs_new:Npn \IfBooleanTF #1
2593 {
2594   \tl_if_single:nF {#1}
2595   { \prg_break:n { \use:n } }
2596   \tl_if_single_token:nF #1
2597   { \prg_break:n { \use:n } }
2598   \token_if_eq_meaning:NNT #1 \c_true_bool
2599   { \prg_break:n { \use_ii:nnn } }
2600   \token_if_eq_meaning:NNT #1 \c_false_bool
2601   { \prg_break:n { \use_iii:nnn } }
2602   \prg_break:n { \use:n }
2603   \prg_break_point:
2604   {
2605     \msg_expandable_error:nnn { cmd } { if-boolean } {#1}

```

```

2606           \use_ii:nn
2607       }
2608   }
2609 \cs_new:Npn \IfBooleanT #1#2 { \IfBooleanTF {#1} {#2} { } }
2610 \cs_new:Npn \IfBooleanF #1 { \IfBooleanTF {#1} { } }

```

(End definition for `\IfBooleanT`, `\IfBooleanF`, and `\IfBooleanTF`.)

`\IfNoValueT` Simple re-naming.
`\IfNoValueF` 2611 `\cs_new_eq:NN \IfNoValueF \tl_if_novalue:nF`
`\IfNoValueTF` 2612 `\cs_new_eq:NN \IfNoValueT \tl_if_novalue:nT`
2613 `\cs_new_eq:NN \IfNoValueTF \tl_if_novalue:nTF`

(End definition for `\IfNoValueT`, `\IfNoValueF`, and `\IfNoValueTF`.)

`\IfValueT` Inverted logic.
`\IfValueF` 2614 `\cs_new:Npn \IfValueF { \tl_if_novalue:nT }`
`\IfValueTF` 2615 `\cs_new:Npn \IfValueT { \tl_if_novalue:nF }`
2616 `\cs_new:Npn \IfValueTF #1#2#3 { \tl_if_novalue:nTF {#1} {#3} {#2} }`

(End definition for `\IfValueT`, `\IfValueF`, and `\IfValueTF`.)

`\IfBlankT` Another simple re-naming.
`\IfBlankF` 2617 `\langle latexrelease \rangle \IncludeInRelease{2022/06/01} \{ \IfBlankTF \} \{ Testing-for-empty-or-blank \}`
`\IfBlankTF` 2618 `\langle latexrelease \rangle \{ \IfBlankTF \} \{ Testing-for-empty-or-blank \}`
2619 `\cs_new_eq:NN \IfBlankF \tl_if_blank:nF`
2620 `\cs_new_eq:NN \IfBlankT \tl_if_blank:nT`
2621 `\cs_new_eq:NN \IfBlankTF \tl_if_blank:nTF`
2622 `\langle latexrelease \rangle \EndIncludeInRelease`
2623 `\langle latexrelease \rangle \IncludeInRelease{2021/11/15} \{ \IfBlankTF \} \{ Testing-for-empty-or-blank \}`
2624 `\langle latexrelease \rangle \{ \IfBlankTF \} \{ Testing-for-empty-or-blank \}`
2625 `\langle latexrelease \rangle \cs_undefine:N \IfBlankF`
2626 `\langle latexrelease \rangle \cs_undefine:N \IfBlankT`
2627 `\langle latexrelease \rangle \cs_undefine:N \IfBlankTF`
2628 `\langle latexrelease \rangle`
2629 `\langle latexrelease \rangle \EndIncludeInRelease`

(End definition for `\IfBlankT`, `\IfBlankF`, and `\IfBlankTF`.)

`\ProcessedArgument` Processed arguments are returned using this name, which is reserved here although the definition will change.
2630 `\tl_new:N \ProcessedArgument`

(End definition for `\ProcessedArgument`.)

`\ReverseBoolean` Simple copies.
`\SplitArgument` 2631 `\cs_new_eq:NN \ReverseBoolean __cmd_bool_reverse:N`
`\SplitList` 2632 `\cs_new_eq:NN \SplitArgument __cmd_split_argument:nnn`
`\TrimSpaces` 2633 `\cs_new_eq:NN \SplitList __cmd_split_list:nn`
2634 `\cs_new_eq:NN \TrimSpaces __cmd_trim_spaces:n`

(End definition for `\ReverseBoolean` and others.)

`\ProcessList` To support `\SplitList`.
2635 `\cs_new_eq:NN \ProcessList \tl_map_function:nN`

(End definition for \ProcessList.)

\GetDocumentCommandArgSpec More simple mappings, with a check that the argument is a single control sequence or active character.

```
2636 \cs_new_protected:Npn \GetDocumentCommandArgSpec #1
2637   {
2638     \__cmd_check_definable:nNT {#1} \GetDocumentCommandArgSpec
2639     { \__cmd_get_arg_spec:N #1 }
2640   }
2641 \cs_new_eq:NN \GetDocumentEnvironmentArgSpec \__cmd_get_arg_spec:n
2642 \cs_new_protected:Npn \ShowDocumentCommandArgSpec #1
2643   {
2644     \__cmd_check_definable:nNT {#1} \ShowDocumentCommandArgSpec
2645     { \__cmd_show_arg_spec:N #1 }
2646   }
2647 \cs_new_eq:NN \ShowDocumentEnvironmentArgSpec \__cmd_show_arg_spec:n
```

(End definition for \GetDocumentCommandArgSpec and others.)

Finally as promised, restore __kernel_chk_if_free_cs:N:

```
2648 ⟨latexrelease⟩\cs_gset_eq:NN \__kernel_chk_if_free_cs:N \__cmd_chk_if_free_cs:N
2649 ⟨latexrelease⟩\cs_undefine:N \__cmd_chk_if_free_cs:N
2650 ⟨latexrelease⟩
2651 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}{ltcmd}%
2652 ⟨latexrelease⟩
2653 ⟨latexrelease⟩
2654 ⟨latexrelease⟩\EndModuleRelease
2655 \ExplSyntaxOff
```

Now in latexrelease mode, redefine \NewDocumentCommand to not complain on commands already defined.

```
2656 ⟨latexrelease⟩\@ifundefined{ExplSyntaxOff}{}{\latexrelease@postltcmd}
2657 ⟨latexrelease⟩\catcode`^=\@latexrelease@catcode@null\relax
2658 ⟨/ekernel | latexrelease⟩
```

We need to stop DocStrip treating @@ in a special way at this point.

```
2659 ⟨@@=⟩
```

lthooks.dtx

1 Introduction

Hooks are points in the code of commands or environments where it is possible to add processing code into existing commands. This can be done by different packages that do not know about each other and to allow for hopefully safe processing it is necessary to sort different chunks of code added by different packages into a suitable processing order.

This is done by the packages adding chunks of code (via `\AddToHook`) and labeling their code with some label by default using the package name as a label.

At `\begin{document}` all code for a hook is then sorted according to some rules (given by `\DeclareHookRule`) for fast execution without processing overhead. If the hook code is modified afterwards (or the rules are changed), a new version for fast processing is generated.

Some hooks are used already in the preamble of the document. If that happens then the hook is prepared for execution (and sorted) already at that point.

2 Package writer interface

The hook management system is offered as a set of CamelCase commands for traditional L^AT_EX 2_E packages (and for use in the document preamble if needed) as well as `expl3` commands for modern packages, that use the L3 programming layer of L^AT_EX. Behind the scenes, a single set of data structures is accessed so that packages from both worlds can coexist and access hooks in other packages.

2.1 L^AT_EX 2_E interfaces

2.1.1 Declaring hooks

With a few exceptions, hooks have to be declared before they can be used. The exceptions are the generic hooks for commands and environments (executed at `\begin` and `\end`), and the hooks run when loading files (see section 3.1).

`\NewHook \NewHook {⟨hook⟩}`

Creates a new `⟨hook⟩`. If this hook is declared within a package it is suggested that its name is always structured as follows: `⟨package-name⟩/⟨hook-name⟩`. If necessary you can further subdivide the name by adding more / parts. If a hook name is already taken, an error is raised and the hook is not created.

The `⟨hook⟩` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\NewReversedHook \NewReversedHook {⟨hook⟩}`

Like `\NewHook` declares a new `⟨hook⟩`, the difference is that the code chunks for this hook are in reverse order by default (those added last are executed first). Any rules for the hook are applied after the default ordering. See sections 2.3 and 2.4 for further details.

The `⟨hook⟩` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\NewMirroredHookPair \NewMirroredHookPair {\langle hook-1\rangle} {\langle hook-2\rangle}
```

A shorthand for `\NewHook{\langle hook-1\rangle}\NewReversedHook{\langle hook-2\rangle}`.

The `\langle hooks\rangle` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

2.1.2 Special declarations for generic hooks

The declarations here should normally not be used. They are available to provide support for special use cases mainly involving generic command hooks.

```
\DisableGenericHook \DisableGenericHook {\langle hook\rangle}
```

After this declaration³ the `\langle hook\rangle` is no longer usable: Any attempt to add further code to it will result in an error and any use, e.g., via `\UseHook`, will simply do nothing.

This is intended to be used with generic command hooks (see `ltcmdhooks-doc`) as depending on the definition of the command such generic hooks may be unusable. If that is known, a package developer can disable such hooks up front.

The `\langle hook\rangle` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\ActivateGenericHook \ActivateGenericHook {\langle hook\rangle}
```

This declaration activates a generic hook provided by a package/class (e.g., one used in code with `\UseHook` or `\UseOneTimeHook`) without it being explicitly declared with `\NewHook`). This command undoes the effect of `\DisableGenericHook`. If the hook is already activated, this command does nothing.

See section 2.6 for a discussion of when this declaration is appropriate.

2.1.3 Using hooks in code

```
\UseHook \UseHook {\langle hook\rangle}
```

Execute the hook code inside a command or environment.

Before `\begin{document}` the fast execution code for a hook is not set up, so in order to use a hook there it is explicitly initialized first. As that involves assignments using a hook at those times is not 100% the same as using it after `\begin{document}`.

The `\langle hook\rangle` *cannot* be specified using the dot-syntax. A leading `.` is treated literally.

³In the 2020/06 release this command was called `\DisableHook`, but that name was misleading as it shouldn't be used to disable non-generic hooks.

```
\UseOneTimeHook \UseOneTimeHook {\<hook>}
```

Some hooks are only used (and can be only used) in one place, for example, those in `\begin{document}` or `\end{document}`. Once we have passed that point adding to the hook through a defined `\<addto-cmd>` command (e.g., `\AddToHook` or `\AtBeginDocument`, etc.) would have no effect (as would the use of such a command inside the hook code itself). It is therefore customary to redefine `\<addto-cmd>` to simply process its argument, i.e., essentially make it behave like `\@firstofone`.

`\UseOneTimeHook` does that: it records that the hook has been consumed and any further attempt to add to it will result in executing the code to be added immediately.

The `\<hook>` cannot be specified using the dot-syntax. A leading `.` is treated literally. See section 2.1.5 for details.

Using `\UseOneTimeHook` several times with the same `\{\<hook>\}` means that it only executes the first time it is used. For example, if it is used in a command that can be called several times then the hook executes during only the *first* invocation of that command; this allows its use as an “initialization hook”.

Mixing `\UseHook` and `\UseOneTimeHook` for the same `\{\<hook>\}` should be avoided, but if this is done then neither will execute after the first `\UseOneTimeHook`.

2.1.4 Updating code for hooks

```
\AddToHook \AddToHook {\<hook>}[{\<label>}]{\<code>}
```

Adds `\<code>` to the `\<hook>` labeled by `\<label>`. When the optional argument `\<label>` is not provided, the `\<default label>` is used (see section 2.1.5). If `\AddToHook` is used in a package/class, the `\<default label>` is the package/class name, otherwise it is `top-level` (the `top-level` label is treated differently: see section 2.1.6).

If there already exists code under the `\<label>` then the new `\<code>` is appended to the existing one (even if this is a reversed hook). If you want to replace existing code under the `\<label>`, first apply `\RemoveFromHook`.

The hook doesn’t have to exist for code to be added to it. However, if it is not declared, then obviously the added `\<code>` will never be executed. This allows for hooks to work regardless of package loading order and enables packages to add to hooks from other packages without worrying whether they are actually used in the current document. See section 2.1.8.

The `\<hook>` and `\<label>` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\RemoveFromHook \RemoveFromHook {\hook}{[\label]}
```

Removes any code labeled by *label* from the *hook*. When the optional argument *label* is not provided, the *default label* is used (see section 2.1.5).

If there is no code under the *label* in the *hook*, or if the *hook* does not exist, a warning is issued when you attempt to \RemoveFromHook, and the command is ignored. \RemoveFromHook should be used only when you know exactly what labels are in a hook. Typically this will be when some code gets added to a hook by a package, then later this code is removed by that same package. If you want to prevent the execution of code from another package, use the **voids** rule instead (see section 2.1.7).

If the optional *label* argument is *, then all code chunks are removed. This is rather dangerous as it may well drop code from other packages (that one may not know about); it should therefore not be used in packages but only in document preambles!

The *hook* and *label* can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

In contrast to the **voids** relationship between two labels in a \DeclareHookRule this is a destructive operation as the labeled code is removed from the hook data structure, whereas the relationship setting can be undone by providing a different relationship later.

A useful application for this declaration inside the document body is when one wants to temporarily add code to hooks and later remove it again, e.g.,

```
\AddToHook{env/quote/before}{\small}
\begin{quote}
  A quote set in a smaller typeface
\end{quote}
...
\RemoveFromHook{env/quote/before}
... now back to normal for further quotes
```

Note that you can't cancel the setting with

```
\AddToHook{env/quote/before}{}  
because that only "adds" a further empty chunk of code to the hook. Adding  
\normalsize would work but that means the hook then contained \small\normalsize  
which means two font size changes for no good reason.
```

The above is only needed if one wants to typeset several quotes in a smaller typeface. If the hook is only needed once then \AddToHookNext is simpler, because it resets itself after one use.

```
\AddToHookNext \AddToHookNext {\hook}{\code}
```

Adds $\langle code \rangle$ to the next invocation of the $\langle hook \rangle$. The code is executed after the normal hook code has finished and it is executed only once, i.e. it is deleted after it was used.

Using this declaration is a global operation, i.e., the code is not lost even if the declaration is used inside a group and the next invocation of the hook happens after the end of that group. If the declaration is used several times before the hook is executed then all code is executed in the order in which it was declared.⁴

If this declaration is used with a one-time hook then the code is only ever used if the declaration comes before the hook's invocation. This is because, in contrast to `\AddToHook`, the code in this declaration is not executed immediately in the case when the invocation of the hook has already happened—in other words, this code will truly execute only on the next invocation of the hook (and in the case of a one-time hook there is no such “next invocation”). This gives you a choice: should my code execute always, or should it execute only at the point where the one-time hook is used (and not at all if this is impossible)? For both of these possibilities there are use cases.

It is possible to nest this declaration using the same hook (or different hooks): e.g.,

```
\AddToHookNext{\hook}{\code-1}\AddToHookNext{\hook}{\code-2}}
```

will execute $\langle code-1 \rangle$ next time the $\langle hook \rangle$ is used and at that point puts $\langle code-2 \rangle$ into the $\langle hook \rangle$ so that it gets executed on following time the hook is run.

A hook doesn't have to exist for code to be added to it. This allows for hooks to work regardless of package loading order. See section 2.1.8.

The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\ClearHookNext \ClearHookNext{\hook}
```

Normally `\AddToHookNext` is only used when you know precisely where it will apply and why you want some extra code at that point. However, there are a few use cases in which such a declaration needs to be canceled, for example, when discarding a page with `\DiscardShipoutBox` (but even then not always), and in such situations `\ClearHookNext` can be used.

2.1.5 Hook names and default labels

It is best practice to use `\AddToHook` in packages or classes *without specifying a $\langle label \rangle$* because then the package or class name is automatically used, which is helpful if rules are needed, and avoids mistyping the $\langle label \rangle$.

Using an explicit $\langle label \rangle$ is only necessary in very specific situations, e.g., if you want to add several chunks of code into a single hook and have them placed in different parts of the hook (by providing some rules).

The other case is when you develop a larger package with several sub-packages. In that case you may want to use the same $\langle label \rangle$ throughout the sub-packages in order to avoid that the labels change if you internally reorganize your code.

Except for `\UseHook`, `\UseOneTimeHook` and `\IfHookEmptyTF` (and their `\Expl3` interfaces `\hook_use:n`, `\hook_use_once:n` and `\hook_if_empty:nTF`), all $\langle hook \rangle$ and $\langle label \rangle$ arguments are processed in the same way: first, spaces are trimmed around the argument, then it is fully expanded until only character tokens remain. If the full expansion

⁴There is no mechanism to reorder such code chunks (or delete them).

of the $\langle hook \rangle$ or $\langle label \rangle$ contains a non-expandable non-character token, a low-level TeX error is raised (namely, the $\langle hook \rangle$ is expanded using TeX's `\csname... \endcsname`, as such, Unicode characters are allowed in $\langle hook \rangle$ and $\langle label \rangle$ arguments). The arguments of `\UseHook`, `\UseOneTimeHook`, and `\IfHookEmptyTF` are processed much in the same way except that spaces are not trimmed around the argument, for better performance.

It is not enforced, but highly recommended that the hooks defined by a package, and the $\langle labels \rangle$ used to add code to other hooks contain the package name to easily identify the source of the code chunk and to prevent clashes. This should be the standard practice, so this hook management code provides a shortcut to refer to the current package in the name of a $\langle hook \rangle$ and in a $\langle label \rangle$. If the $\langle hook \rangle$ name or the $\langle label \rangle$ consist just of a single dot (.), or starts with a dot followed by a slash (/) then the dot denotes the $\langle default label \rangle$ (usually the current package or class name—see `\SetDefaultHookLabel`). A “.” or “./” anywhere else in a $\langle hook \rangle$ or in $\langle label \rangle$ is treated literally and is not replaced.

For example, inside the package `mypackage.sty`, the default label is `mypackage`, so the instructions:

```
\NewHook  {./hook}
\AddToHook {./hook}[]{}{code}      % Same as \AddToHook{./hook}{code}
\AddToHook {./hook}[/sub]{}{code}
\DeclareHookRule{begindocument}{}{before}{babel}
\AddToHook {file/foo.tex/after}{code}
```

are equivalent to:

```
\NewHook  {mymodule/hook}
\AddToHook {mymodule/hook}[mymodule]{code}
\AddToHook {mymodule/hook}[mymodule/sub]{code}
\DeclareHookRule{begindocument}{mymodule}{before}{babel}
\AddToHook {file/foo.tex/after}{code}           % unchanged
```

The $\langle default label \rangle$ is automatically set equal to the name of the current package or class at the time the package is loaded. If the hook command is used outside of a package, or the current file wasn't loaded with `\usepackage` or `\documentclass`, then the `top-level` is used as the $\langle default label \rangle$. This may have exceptions—see `\PushDefaultHookLabel`.

This syntax is available in all $\langle label \rangle$ arguments and most $\langle hook \rangle$ arguments, both in the L^AT_EX 2 _{ϵ} interface, and the L^AT_EX3 interface described in section 2.2.

Note, however, that the replacement of . by the $\langle default label \rangle$ takes place when the hook command is executed, so actions that are somehow executed after the package ends will have the wrong $\langle default label \rangle$ if the dot-syntax is used. For that reason, this syntax is not available in `\UseHook` (and `\hook_use:n`) because the hook is most of the time used outside of the package file in which it was defined. This syntax is also not available in the hook conditionals `\IfHookEmptyTF` (and `\hook_if_empty:nTF`), because these conditionals are used in some performance-critical parts of the hook management code, and because they are usually used to refer to other package's hooks, so the dot-syntax doesn't make much sense.

In some cases, for example in large packages, one may want to separate it in logical parts, but still use the main package name as $\langle label \rangle$, then the $\langle default label \rangle$ can be set using `\SetDefaultHookLabel` or `\PushDefaultHookLabel{...}... \PopDefaultHookLabel`.

```
\PushDefaultHookLabel \PushDefaultHookLabel {\<default label>}
\PopDefaultHookLabel   <code>
\PopDefaultHookLabel
```

\PushDefaultHookLabel sets the current *<default label>* to be used in *<label>* arguments, or when replacing a leading “.” (see above). \PopDefaultHookLabel reverts the *<default label>* to its previous value.

Inside a package or class, the *<default label>* is equal to the package or class name, unless explicitly changed. Everywhere else, the *<default label>* is **top-level** (see section 2.1.6) unless explicitly changed.

The effect of \PushDefaultHookLabel holds until the next \PopDefaultHookLabel. \usepackage (and \RequirePackage and \documentclass) internally use

```
\PushDefaultHookLabel{\<package name>}
  <package code>
\PopDefaultHookLabel
```

to set the *<default label>* for the package or class file. Inside the *<package code>* the *<default label>* can also be changed with \SetDefaultHookLabel. \input and other file input-related commands from the L^AT_EX kernel do not use \PushDefaultHookLabel, so code within files loaded by these commands does *not* get a dedicated *<label>*! (that is, the *<default label>* is the current active one when the file was loaded.)

Packages that provide their own package-like interfaces (TikZ’s \usetikzlibrary, for example) can use \PushDefaultHookLabel and \PopDefaultHookLabel to set dedicated labels and to emulate \usepackage-like hook behavior within those contexts.

The **top-level** label is treated differently, and is reserved to the user document, so it is not allowed to change the *<default label>* to **top-level**.

```
\SetDefaultHookLabel \SetDefaultHookLabel {\<default label>}
```

Similarly to \PushDefaultHookLabel, sets the current *<default label>* to be used in *<label>* arguments, or when replacing a leading “.”. The effect holds until the label is changed again or until the next \PopDefaultHookLabel. The difference between \PushDefaultHookLabel and \SetDefaultHookLabel is that the latter does not save the current *<default label>*.

This command is useful when a large package is composed of several smaller packages, but all should have the same *<label>*, so \SetDefaultHookLabel can be used at the beginning of each package file to set the correct label.

\SetDefaultHookLabel is not allowed in the main document, where the *<default label>* is **top-level** and there is no \PopDefaultHookLabel to end its effect. It is also not allowed to change the *<default label>* to **top-level**.

2.1.6 The top-level label

The **top-level** label, assigned to code added from the main document, is different from other labels. Code added to hooks (usually \AtBeginDocument) in the preamble is almost always to change something defined by a package, so it should go at the very end of the hook.

Therefore, code added in the **top-level** is always executed at the end of the hook, regardless of where it was declared. If the hook is reversed (see \NewReversedHook), the **top-level** chunk is executed at the very beginning instead.

Rules regarding `top-level` have no effect: if a user wants to have a specific set of rules for a code chunk, they should use a different label to said code chunk, and provide a rule for that label instead.

The `top-level` label is exclusive for the user, so trying to add code with that label from a package results in an error.

2.1.7 Defining relations between hook code

The default assumption is that code added to hooks by different packages are independent and the order in which they are executed is irrelevant. While this is true in many cases it is obviously false in others.

Before the hook management system was introduced packages had to take elaborate precaution to determine of some other package got loaded as well (before or after) and find some ways to alter its behavior accordingly. In addition it was often the user's responsibility to load packages in the right order so that code added to hooks got added in the right order and some cases even altering the loading order wouldn't resolve the conflicts.

With the new hook management system it is now possible to define rules (i.e., relationships) between code chunks added by different packages and explicitly describe in which order they should be processed.

```
\DeclareHookRule \DeclareHookRule {\langle hook\rangle}{\langle label1\rangle}{\langle relation\rangle}{\langle label2\rangle}
```

Defines a relation between $\langle label1 \rangle$ and $\langle label2 \rangle$ for a given $\langle hook \rangle$. If $\langle hook \rangle$ is `??` this defines a default relation for all hooks that use the two labels, i.e., that have chunks of code labeled with $\langle label1 \rangle$ and $\langle label2 \rangle$. Rules specific to a given hook take precedence over default rules that use `??` as the $\langle hook \rangle$.

Currently, the supported relations are the following:

`before` or `<` Code for $\langle label1 \rangle$ comes before code for $\langle label2 \rangle$.

`after` or `>` Code for $\langle label1 \rangle$ comes after code for $\langle label2 \rangle$.

`incompatible-warning` Only code for either $\langle label1 \rangle$ or $\langle label2 \rangle$ can appear for that hook (a way to say that two packages—or parts of them—are incompatible). A warning is raised if both labels appear in the same hook.

`incompatible-error` Like `incompatible-warning` but instead of a warning a L^AT_EX error is raised, and the code for both labels are dropped from that hook until the conflict is resolved.

`voids` Code for $\langle label1 \rangle$ overwrites code for $\langle label2 \rangle$. More precisely, code for $\langle label2 \rangle$ is dropped for that hook. This can be used, for example if one package is a superset in functionality of another one and therefore wants to undo code in some hook and replace it with its own version.

`unrelated` The order of code for $\langle label1 \rangle$ and $\langle label2 \rangle$ is irrelevant. This rule is there to undo an incorrect rule specified earlier.

There can only be a single relation between two labels for a given hook, i.e., a later `\DeclareHookrule` overwrites any previous declaration.

The $\langle hook \rangle$ and $\langle label \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

```
\ClearHookRule \ClearHookRule{\hook}{\label1}{\label2}
```

Syntactic sugar for saying that $\langle\text{label1}\rangle$ and $\langle\text{label2}\rangle$ are unrelated for the given $\langle\text{hook}\rangle$.

```
\DeclareDefaultHookRule \DeclareDefaultHookRule{\label1}{\relation}{\label2}
```

This sets up a relation between $\langle\text{label1}\rangle$ and $\langle\text{label2}\rangle$ for all hooks unless overwritten by a specific rule for a hook. Useful for cases where one package has a specific relation to some other package, e.g., is `incompatible` or always needs a special ordering `before` or `after`. (Technically it is just a shorthand for using `\DeclareHookRule` with `??` as the hook name.)

Declaring default rules is only supported in the document preamble.⁵

The $\langle\text{label}\rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

2.1.8 Querying hooks

Simpler data types, like token lists, have three possible states; they can:

- exist and be empty;
- exist and be non-empty; and
- not exist (in which case emptiness doesn't apply);

Hooks are a bit more complicated: a hook may exist or not, and independently it may or may not be empty. This means that even a hook that doesn't exist may be non-empty and it can also be disabled.

This seemingly strange state may happen when, for example, package *A* defines hook *A/foo*, and package *B* adds some code to that hook. However, a document may load package *B* before package *A*, or may not load package *A* at all. In both cases some code is added to hook *A/foo* without that hook being defined yet, thus that hook is said to be non-empty, whereas it doesn't exist. Therefore, querying the existence of a hook doesn't imply its emptiness, neither does the other way around.

Given that code or rules can be added to a hook even if it doesn't physically exist yet, means that a querying its existence has no real use case (in contrast to other variables that can only be update if they have already been declared). For that reason only the test for emptiness has a public interface.

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its “next” token list. The hook doesn't need to be declared to have code added to its code pool. A hook is said to exist when it was declared with `\NewHook` or some variant thereof. Generic hooks such as `file` and `env` hooks are automatically declared when code is added to them.

```
\IfHookEmptyTF * \IfHookEmptyTF {\hook} {\truecode} {\falsecode}
```

Tests if the $\langle\text{hook}\rangle$ is empty (*i.e.*, no code was added to it using either `\AddToHook` or `\AddToHookNext`) or such code was removed again (via `\RemoveFromHook`), and branches to either $\langle\text{true code}\rangle$ or $\langle\text{false code}\rangle$ depending on the result.

The $\langle\text{hook}\rangle$ cannot be specified using the dot-syntax. A leading `.` is treated literally.

⁵Trying to do so, e.g., via `\DeclareHookRule` with `??` has bad side-effects and is not supported (though not explicitly caught for performance reasons).

2.1.9 Displaying hook code

If one has to adjust the code execution in a hook using a hook rule it is helpful to get some information about the code associated with a hook, its current order and the existing rules.

```
\ShowHook \ShowHook {\hook}
\LogHook \LogHook {\hook}
```

Displays information about the *hook* such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

\LogHook prints the information to the .log file, and \ShowHook prints them to the terminal/command window and starts TeX's prompt (only in \errorstopmode) to wait for user action.

The *hook* can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

Suppose a hook `example-hook` whose output of \ShowHook{example-hook} is:

```
1   -> The hook 'example-hook':
2   > Code chunks:
3   >     foo -> [code from package 'foo']
4   >     bar -> [from package 'bar']
5   >     baz -> [package 'baz' is here]
6   > Document-level (top-level) code (executed last):
7   >     -> [code from 'top-level']
8   > Extra code for next invocation:
9   >     -> [one-time code]
10  > Rules:
11  >     foo|baz with relation >
12  >     baz|bar with default relation <
13  > Execution order (after applying rules):
14  >     baz, foo, bar.
```

In the listing above, lines 3 to 5 show the three code chunks added to the hook and their respective labels in the format

label -> *code*

Line 7 shows the code chunk added by the user in the main document (labeled `top-level`) in the format

```
Document-level (top-level) code (executed {first/last}):
-> (top-level code)
```

This code will be either the first or last code executed by the hook (`last` if the hook is normal, `first` if it is reversed). This chunk is not affected by rules and does not take part in sorting.

Line 9 shows the code chunk for the next execution of the hook in the format

$\rightarrow \langle next\text{-}code \rangle$

This code will be used and disappear at the next `\UseHook{example-hook}`, in contrast to the chunks mentioned earlier, which can only be removed from that hook by doing `\RemoveFromHook{\langle label \rangle}{example-hook}`.

Lines 11 and 12 show the rules declared that affect this hook in the format

$\langle label\text{-}1 \rangle | \langle label\text{-}2 \rangle \text{ with } \langle default? \rangle \text{ relation } \langle relation \rangle$

which means that the $\langle relation \rangle$ applies to $\langle label\text{-}1 \rangle$ and $\langle label\text{-}2 \rangle$, in that order, as detailed in `\DeclareHookRule`. If the relation is `default` it means that this rule applies to $\langle label\text{-}1 \rangle$ and $\langle label\text{-}2 \rangle$ in *all* hooks, (unless overridden by a non-default relation).

Finally, line 14 lists the labels in the hook after sorting; that is, in the order they will be executed when the hook is used.

2.1.10 Debugging hook code

`\DebugHooksOn` `\DebugHooksOn`

`\DebugHooksOff` Turn the debugging of hook code on or off. This displays most changes made to the hook data structures. The output is rather coarse and not really intended for normal use.

2.2 L3 programming layer (`expl3`) interfaces

This is a quick summary of the L^AT_EX3 programming interfaces for use with packages written in `expl3`. In contrast to the L^AT_EX 2_E interfaces they always use mandatory arguments only, e.g., you always have to specify the $\langle label \rangle$ for a code chunk. We therefore suggest to use the declarations discussed in the previous section even in `expl3` packages, but the choice is yours.

<code>\hook_new:n</code>	<code>\hook_new:n {\langle hook \rangle}</code>
<code>\hook_new_reversed:n</code>	<code>\hook_new_reversed:n {\langle hook \rangle}</code>
<code>\hook_new_pair:nn</code>	<code>\hook_new_pair:nn {\langle hook-1 \rangle} {\langle hook-2 \rangle}</code>

Creates a new $\langle hook \rangle$ with normal or reverse ordering of code chunks. `\hook_new_pair:nn` creates a pair of such hooks with $\{\langle hook-2 \rangle\}$ being a reversed hook. If a hook name is already taken, an error is raised and the hook is not created.

The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\hook_disable_generic:n` `\hook_disable_generic:n {\langle hook \rangle}`

Marks $\{\langle hook \rangle\}$ as disabled. Any further attempt to add code to it or declare it, will result in an error and any call to `\hook_use:n` will simply do nothing.

This declaration is intended for use with generic hooks that are known not to work (see `lthcmdhooks-doc`) if they receive code.

The $\langle hook \rangle$ can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\hook_activate_generic:n \hook_activate_generic:n {<hook>}`

This is like `\hook_new:n` but it does nothing if the hook was previously declared with `\hook_new:n`. This declaration should be used only in special situations, e.g., when a command from another package needs to be altered and it is not clear whether a generic cmd hook (for that command) has been previously explicitly declared.

Normally `\hook_new:n` should be used instead of this.

`\hook_use:n \hook_use:n {<hook>}`

Executes the `{<hook>}` code followed (if set up) by the code for next invocation only, then empties that next invocation code.

The `<hook>` cannot be specified using the dot-syntax. A leading `.` is treated literally.

`\hook_use_once:n \hook_use_once:n {<hook>}`

Changes the `{<hook>}` status so that from now on any addition to the hook code is executed immediately. Then execute any `{<hook>}` code already set up.

The `<hook>` cannot be specified using the dot-syntax. A leading `.` is treated literally.

`\hook_gput_code:nnn \hook_gput_code:nnn {<hook>} {<label>} {<code>}`

Adds a chunk of `<code>` to the `<hook>` labeled `<label>`. If the label already exists the `<code>` is appended to the already existing code.

If code is added to an external `<hook>` (of the kernel or another package) then the convention is to use the package name as the `<label>` not some internal module name or some other arbitrary string.

The `<hook>` and `<label>` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\hook_gput_next_code:nn \hook_gput_next_code:nn {<hook>} {<code>}`

Adds a chunk of `<code>` for use only in the next invocation of the `<hook>`. Once used it is gone.

This is simpler than `\hook_gput_code:nnn`, the code is simply appended to the hook in the order of declaration at the very end, i.e., after all standard code for the hook got executed.

Thus if one needs to undo what the standard does one has to do that as part of `<code>`.

The `<hook>` can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\hook_gclear_next_code:n \hook_gclear_next_code:n {<hook>}`

Undo any earlier `\hook_gput_next_code:nn`.

`\hook_gremove_code:nn \hook_gremove_code:nn {⟨hook⟩} {⟨label⟩}`

Removes any code for *⟨hook⟩* labeled *⟨label⟩*.

If there is no code under the *⟨label⟩* in the *⟨hook⟩*, or if the *⟨hook⟩* does not exist, a warning is issued when you attempt to use `\hook_gremove_code:nn`, and the command is ignored.

If the second argument is `*`, then all code chunks are removed. This is rather dangerous as it drops code from other packages one may not know about, so think twice before using that!

The *⟨hook⟩* and *⟨label⟩* can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\hook_gset_rule:nnnn \hook_gset_rule:nnnn {⟨hook⟩} {⟨label1⟩} {⟨relation⟩} {⟨label2⟩}`

Relate *⟨label1⟩* with *⟨label2⟩* when used in *⟨hook⟩*. See `\DeclareHookRule` for the allowed *⟨relation⟩*s. If *⟨hook⟩* is `??` a default rule is specified.

The *⟨hook⟩* and *⟨label⟩* can be specified using the dot-syntax to denote the current package name. See section 2.1.5. The dot-syntax is parsed in both *⟨label⟩* arguments, but it usually makes sense to be used in only one of them.

`\hook_if_empty_p:n ∗ \hook_if_empty:nTF {⟨hook⟩} {⟨true code⟩} {⟨false code⟩}`

`\hook_if_empty:nTF ∗` Tests if the *⟨hook⟩* is empty (*i.e.*, no code was added to it using either `\AddToHook` or `\AddToHookNext`), and branches to either *⟨true code⟩* or *⟨false code⟩* depending on the result.

The *⟨hook⟩* cannot be specified using the dot-syntax. A leading `.` is treated literally.

`\hook_show:n \hook_show:n {⟨hook⟩}`
`\hook_log:n \hook_log:n {⟨hook⟩}`

Displays information about the *⟨hook⟩* such as

- the code chunks (and their labels) added to it,
- any rules set up to order them,
- the computed order in which the chunks are executed,
- any code executed on the next invocation only.

`\hook_log:n` prints the information to the `.log` file, and `\hook_show:n` prints them to the terminal/command window and starts TeX's prompt (only if `\errorstopmode`) to wait for user action.

The *⟨hook⟩* can be specified using the dot-syntax to denote the current package name. See section 2.1.5.

`\hook_debug_on: \hook_debug_on:`

`\hook_debug_off:` Turns the debugging of hook code on or off. This displays changes to the hook data.

2.3 On the order of hook code execution

Chunks of code for a *⟨hook⟩* under different labels are supposed to be independent if there are no special rules set up that define a relation between the chunks. This means that you can't make assumptions about the order of execution!

Suppose you have the following declarations:

```
\NewHook{myhook}
\AddToHook{myhook}{packageA}{\typeout{A}}
\AddToHook{myhook}{packageB}{\typeout{B}}
\AddToHook{myhook}{packageC}{\typeout{C}}
```

then executing the hook with \UseHook will produce the typeout A B C in that order. In other words, the execution order is computed to be packageA, packageB, packageC which you can verify with \ShowHook{myhook}:

```
-> The hook 'myhook':
> Code chunks:
>     packageA -> \typeout {A}
>     packageB -> \typeout {B}
>     packageC -> \typeout {C}
> Document-level (top-level) code (executed last):
>     ---
> Extra code for next invocation:
>     ---
> Rules:
>     ---
> Execution order:
>     packageA, packageB, packageC.
```

The reason is that the code chunks are internally saved in a property list and the initial order of such a property list is the order in which key-value pairs got added. However, that is only true if nothing other than adding happens!

Suppose, for example, you want to replace the code chunk for packageA, e.g.,

```
\RemoveFromHook{myhook}{packageA}
\AddToHook{myhook}{packageA}{\typeout{A alt}}
```

then your order becomes packageB, packageC, packageA because the label got removed from the property list and then re-added (at its end).

While that may not be too surprising, the execution order is also sometimes altered if you add a redundant rule, e.g. if you specify

```
\DeclareHookRule{myhook}{packageA}{before}{packageB}
```

instead of the previous lines we get

```
-> The hook 'myhook':
> Code chunks:
>     packageA -> \typeout {A}
>     packageB -> \typeout {B}
>     packageC -> \typeout {C}
> Document-level (top-level) code (executed last):
>     ---
> Extra code for next invocation:
>     ---
> Rules:
>     packageB|packageA with relation >
> Execution order (after applying rules):
>     packageA, packageC, packageB.
```

As you can see the code chunks are still in the same order, but in the execution order for the labels `packageB` and `packageC` have swapped places. The reason is that, with the rule there are two orders that satisfy it, and the algorithm for sorting happened to pick a different one compared to the case without rules (where it doesn't run at all as there is nothing to resolve). Incidentally, if we had instead specified the redundant rule

```
\DeclareHookRule{myhook}{packageB}{before}{packageC}
```

the execution order would not have changed.

In summary: it is not possible to rely on the order of execution unless there are rules that partially or fully define the order (in which you can rely on them being fulfilled).

2.4 The use of “reversed” hooks

You may have wondered why you can declare a “reversed” hook with `\NewReversedHook` and what that does exactly.

In short: the execution order of a reversed hook (without any rules!) is exactly reversed to the order you would have gotten for a hook declared with `\NewHook`.

This is helpful if you have a pair of hooks where you expect to see code added that involves grouping, e.g., starting an environment in the first and closing that environment in the second hook. To give a somewhat contrived example⁶, suppose there is a package adding the following:

```
\AddToHook{env/quote/before}[package-1]{\begin{itshape}}
\AddToHook{env/quote/after} [package-1]{\end{itshape}}
```

As a result, all quotes will be in italics. Now suppose further that another `package-too` makes the quotes also in blue and therefore adds:

```
\usepackage{color}
\AddToHook{env/quote/before}[package-too]{\begin{color}{blue}}
\AddToHook{env/quote/after} [package-too]{\end{color}}
```

Now if the `env/quote/after` hook would be a normal hook we would get the same execution order in both hooks, namely:

`package-1, package-too`

(or vice versa) and as a result, would get:

```
\begin{itshape}\begin{color}{blue} ...
\end{itshape}\end{color}
```

and an error message that `\begin{color}` ended by `\end{itshape}`. With `env/quote/after` declared as a reversed hook the execution order is reversed and so all environments are closed in the correct sequence and `\ShowHook` would give us the following output:

```
-> The hook 'env/quote/after':
> Code chunks:
>     package-1 -> \end {itshape}
>     package-too -> \end {color}
> Document-level (top-level) code (executed first):
```

⁶there are simpler ways to achieve the same effect.

```

>     ---
> Extra code for next invocation:
>     ---
> Rules:
>     ---
> Execution order (after reversal):
>     package-too, package-1.

```

The reversal of the execution order happens before applying any rules, so if you alter the order you will probably have to alter it in both hooks, not just in one, but that depends on the use case.

2.5 Difference between “normal” and “one-time” hooks

When executing a hook a developer has the choice of using either `\UseHook` or `\UseOneTimeHook` (or their `\Expl3` equivalents `\hook_use:n` and `\hook_use_once:n`). This choice affects how `\AddToHook` is handled after the hook has been executed for the first time.

With normal hooks adding code via `\AddToHook` means that the code chunk is added to the hook data structure and then used each time `\UseHook` is called.

With one-time hooks it this is handled slightly differently: After `\UseOneTimeHook` has been called, any further attempts to add code to the hook via `\AddToHook` will simply execute the `\langle code \rangle` immediately.

This has some consequences one needs to be aware of:

- If `\langle code \rangle` is added to a normal hook after the hook was executed and it is never executed again for one or the other reason, then this new `\langle code \rangle` will never be executed.
- In contrast if that happens with a one-time hook the `\langle code \rangle` is executed immediately.

In particular this means that construct such as

```
\AddToHook{myhook}
  { \langle code-1 \rangle \AddToHook{myhook}{\langle code-2 \rangle} \langle code-3 \rangle }
```

works for one-time hooks⁷ (all three code chunks are executed one after another), but it makes little sense with a normal hook, because with a normal hook the first time `\UseHook{myhook}` is executed it would

- execute `\langle code-1 \rangle`,
- then execute `\AddToHook{myhook}{\langle code-2 \rangle}` which adds the code chunk `\langle code-2 \rangle` to the hook for use on the next invocation,
- and finally execute `\langle code-3 \rangle`.

The second time `\UseHook` is called it would execute the above and in addition `\langle code-2 \rangle` as that was added as a code chunk to the hook in the meantime. So each time the hook is used another copy of `\langle code-2 \rangle` is added and so that code chunk is executed $\langle \# \text{ of invocations} \rangle - 1$ times.

⁷This is sometimes used with `\AtBeginDocument` which is why it is supported.

2.6 Generic hooks provided by packages

The hook management system also implements a category of hooks that are called “Generic Hooks”. Normally a hook has to be explicitly declared before it can be used in code. This ensures that different packages are not using the same hook name for unrelated purposes—something that would result in absolute chaos. However, there are a number of “standard” hooks where it is unreasonable to declare them beforehand, e.g., each and every command has (in theory) an associated `before` and `after` hook. In such cases, i.e., for command, environment or file hooks, they can be used simply by adding code to them with `\AddToHook`. For more specialized generic hooks, e.g., those provided by `babel`, you have to additionally enable them with `\ActivateGenericHook` as explained below.

The generic hooks provided by L^AT_EX are those for `cmd`, `env`, `file`, `include` package, and `class`, and all these are available out of the box: you only have to use `\AddToHook` to add code to them, but you don’t have to add `\UseHook` or `\UseOneTimeHook` to your code, because this is already done for you (or, in the case of `cmd` hooks, the command’s code is patched at `\begin{document}`, if necessary).

However, if you want to provide further generic hooks in your own code, the situation is slightly different. To do this you should use `\UseHook` or `\UseOneTimeHook`, but *without declaring the hook* with `\NewHook`. As mentioned earlier, a call to `\UseHook` with an undeclared hook name does nothing. So as an additional setup step, you need to explicitly activate your generic hook. Note that a generic hook produced in this way is always a normal hook.

For a truly generic hook, with a variable part in the hook name, such upfront activation would be difficult or impossible, because you typically do not know what kind of variable parts may come up in real documents.

For example, `babel` may want to provide hooks such as `babel/⟨language⟩/afterextras`. Language support in `babel` is often done through external language packages. Thus doing the activation for all languages inside the core `babel` code is not a viable approach. Instead it needs to be done by each language package (or by the user who wants to use a particular hook).

Because the hooks are not declared with `\NewHook` their names should be carefully chosen to ensure that they are (likely to be) unique. Best practice is to include the package or command name, as was done in the `babel` example above.

Generic hooks defined in this way are always normal hooks (i.e., you can’t implement reversed hooks this way). This is a deliberate limitation, because it speeds up the processing considerably.

2.7 Private L^AT_EX kernel hooks

There are a few places where it is absolutely essential for L^AT_EX to function correctly that code is executed in a precisely defined order. Even that could have been implemented with the hook management (by adding various rules to ensure the appropriate ordering with respect to other code added by packages). However, this makes every document unnecessary slow, because there has to be sorting even though the result is predetermined. Furthermore it forces package writers to unnecessarily add such rules if they add further code to the hook (or break L^AT_EX).

For that reason such code is not using the hook management, but instead private kernel commands directly before or after a public hook with the following naming convention:

`\@kernel@before@{hook}` or `\@kernel@after@{hook}`. For example, in `\enddocument` you find

```
\UseHook{enddocument}%
\@kernel@after@enddocument
```

which means first the user/package-accessible `enddocument` hook is executed and then the internal kernel hook. As their name indicates these kernel commands should not be altered by third-party packages, so please refrain from that in the interest of stability and instead use the public hook next to it.⁸

2.8 Legacy L^AT_EX 2_E interfaces

L^AT_EX 2_E offered a small number of hooks together with commands to add to them. They are listed here and are retained for backwards compatibility.

With the new hook management, several additional hooks have been added to L^AT_EX and more will follow. See the next section for what is already available.

`\AtBeginDocument` `\AtBeginDocument [{label}] {code}`

If used without the optional argument `{label}`, it works essentially like before, i.e., it is adding `{code}` to the hook `begindocument` (which is executed inside `\begin{document}`). However, all code added this way is labeled with the label `top-level` (see section 2.1.6) if done outside of a package or class or with the package/class name if called inside such a file (see section 2.1.5).

This way one can add further code to the hook using `\AddToHook` or `\AtBeginDocument` using a different label and explicitly order the code chunks as necessary, e.g., run some code before or after another package's code. When using the optional argument the call is equivalent to running `\AddToHook {begindocument} [{label}] {code}`.

`\AtBeginDocument` is a wrapper around the `begindocument` hook (see section 3.2), which is a one-time hook. As such, after the `begindocument` hook is executed at `\begin{document}` any attempt to add `{code}` to this hook with `\AtBeginDocument` or with `\AddToHook` will cause that `{code}` to execute immediately instead. See section 2.5 for more on one-time hooks.

For important packages with known order requirement we may over time add rules to the kernel (or to those packages) so that they work regardless of the loading-order in the document.

`\AtEndDocument` `\AtEndDocument [{label}] {code}`

Like `\AtBeginDocument` but for the `enddocument` hook.

The few hooks that existed previously in L^AT_EX 2_E used internally commands such as `\@begindocumenthook` and packages sometimes augmented them directly rather than working through `\AtBeginDocument`. For that reason there is currently support for this, that is, if the system detects that such an internal legacy hook command contains code it adds it to the new hook system under the label `legacy` so that it doesn't get lost.

However, over time the remaining cases of direct usage need updating because in one of the future release of L^AT_EX we will turn this legacy support off, as it does unnecessary slow down the processing.

⁸As with everything in TeX there is no enforcement of this rule, and by looking at the code it is easy to find out how the kernel adds to them. The main reason of this section is therefore to say "please don't do that, this is unconfigurable code!"

3 L^AT_EX 2 _{ϵ} commands and environments augmented by hooks

In this section we describe the standard hooks that are now offered by L^AT_EX, or give pointers to other documents in which they are described. This section will grow over time (and perhaps eventually move to usrguide3).

3.1 Generic hooks

As stated earlier, with the exception of generic hooks, all hooks must be declared with \NewHook before they can be used. All generic hooks have names of the form “ $\langle type \rangle / \langle name \rangle / \langle position \rangle$ ”, where $\langle type \rangle$ is from the predefined list shown below, and $\langle name \rangle$ is the variable part whose meaning will depend on the $\langle type \rangle$. The last component, $\langle position \rangle$, has more complex possibilities: it can always be `before` or `after`; for `env` hooks, it can also be `begin` or `end`; and for `include` hooks it can also be `end`. Each specific hook is documented below, or in `ltcmdhooks-doc.pdf` or `ltfilehook-doc.pdf`.

The generic hooks provided by L^AT_EX belong to one of the six types:

env Hooks executed before and after environments – $\langle name \rangle$ is the name of the environment, and available values for $\langle position \rangle$ are `before`, `begin`, `end`, and `after`;

cmd Hooks added to and executed before and after commands – $\langle name \rangle$ is the name of the command, and available values for $\langle position \rangle$ are `before` and `after`;

file Hooks executed before and after reading a file – $\langle name \rangle$ is the name of the file (with extension), and available values for $\langle position \rangle$ are `before` and `after`;

package Hooks executed before and after loading packages – $\langle name \rangle$ is the name of the package, and available values for $\langle position \rangle$ are `before` and `after`;

class Hooks executed before and after loading classes – $\langle name \rangle$ is the name of the class, and available values for $\langle position \rangle$ are `before` and `after`;

include Hooks executed before and after \included files – $\langle name \rangle$ is the name of the included file (without the .tex extension), and available values for $\langle position \rangle$ are `before`, `end`, and `after`.

Each of the hooks above are detailed in the following sections and in linked documentation.

3.1.1 Generic hooks for all environments

Every environment $\langle env \rangle$ has now four associated hooks coming with it:

env/⟨env⟩/before This hook is executed as part of \begin as the very first action, in particular prior to starting the environment group. Its scope is therefore not restricted by the environment.

env/⟨env⟩/begin This hook is executed as part of \begin directly in front of the code specific to the environment start (e.g., the second argument of \newenvironment). Its scope is the environment body.

env/⟨env⟩/end This hook is executed as part of \end directly in front of the code specific to the end of the environment (e.g., the third argument of \newenvironment).

env/<env>/after This hook is executed as part of `\end` after the code specific to the environment end and after the environment group has ended. Its scope is therefore not restricted by the environment.

The hook is implemented as a reversed hook so if two packages add code to `env/<env>/before` and to `env/<env>/after` they can add surrounding environments and the order of closing them happens in the right sequence.

Generic environment hooks are never one-time hooks even with environments that are supposed to appear only once in a document.⁹ In contrast to other hooks there is also no need to declare them using `\NewHook`.

The hooks are only executed if `\begin{<env>}` and `\end{<env>}` is used. If the environment code is executed via low-level calls to `\<env>` and `\end{<env>}` (e.g., to avoid the environment grouping) they are not available. If you want them available in code using this method, you would need to add them yourself, i.e., write something like

```
\UseHook{env/quote/before}\quote  
...  
\endquote\UseHook{env/quote/after}
```

to add the outer hooks, etc.

Largely for compatibility with existing packages, the following four commands are also available to set the environment hooks; but for new packages we recommend directly using the hook names and `\AddToHook`.

\BeforeBeginEnvironment `\BeforeBeginEnvironment [<label>] {<env>} {<code>}`

This declaration adds to the `env/<env>/before` hook using the `<label>`. If `<label>` is not given, the `<default label>` is used (see section 2.1.5).

\AtBeginEnvironment `\AtBeginEnvironment [<label>] {<env>} {<code>}`

This is like `\BeforeBeginEnvironment` but it adds to the `env/<env>/begin` hook.

\AtEndEnvironment `\AtEndEnvironment [<label>] {<env>} {<code>}`

This is like `\BeforeBeginEnvironment` but it adds to the `env/<env>/end` hook.

\AfterEndEnvironment `\AfterEndEnvironment [<label>] {<env>} {<code>}`

This is like `\BeforeBeginEnvironment` but it adds to the `env/<env>/after` hook.

3.1.2 Generic hooks for commands

Similar to environments there are now (at least in theory) two generic hooks available for any L^AT_EX command. These are

cmd/<name>/before This hook is executed at the very start of the command execution.

cmd/<name>/after This hook is executed at the very end of the command body. It is implemented as a reversed hook.

In practice there are restrictions and especially the `after` hook works only with a subset of commands. Details about these restrictions are documented in `ltcmdhooks-doc.pdf` or with code in `ltcmdhooks-code.pdf`.

⁹Thus if one adds code to such hooks after the environment has been processed, it will only be executed if the environment appears again and if that doesn't happen the code will never get executed.

3.1.3 Generic hooks provided by file loading operations

There are several hooks added to L^AT_EX's process of loading file via its high-level interfaces such as `\input`, `\include`, `\usepackage`, `\RequirePackage`, etc. These are documented in `ltfilehook-doc.pdf` or with code in `ltfilehook-code.pdf`.

3.2 Hooks provided by `\begin{document}`

Until 2020 `\begin{document}` offered exactly one hook that one could add to using `\AtBeginDocument`. Experiences over the years have shown that this single hook in one place was not enough and as part of adding the general hook management system a number of additional hooks have been added at this point. The places for these hooks have been chosen to provide the same support as offered by external packages, such as `etoolbox` and others that augmented `\document` to gain better control.

Supported are now the following hooks (all of them one-time hooks):

`begindocument/before` This hook is executed at the very start of `\document`, one can think of it as a hook for code at the end of the preamble section and this is how it is used by `etoolbox`'s `\AtEndPreamble`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

`begindocument` This hook is added to when using `\AtBeginDocument` and it is executed after the `.aux` file as be read in and most initialization are done, so they can be altered and inspected by the hook code. It is followed by a small number of further initializations that shouldn't be altered and are therefore coming later.

The hook should not be used to add material for typesetting as we are still in L^AT_EX's initialization phase and not in the document body. If such material needs to be added to the document body use the next hook instead.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

`begindocument/end` This hook is executed at the end of the `\document` code in other words at the beginning of the document body. The only command that follows it is `\ignorespaces`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

The generic hooks executed by `\begin` also exist, i.e., `env/document/before` and `env/document/begin`, but with this special environment it is better use the dedicated one-time hooks above.

3.3 Hooks provided by `\end{document}`

L^AT_EX 2_< always provided `\AtEndDocument` to add code to the execution of `\end{document}` just in front of the code that is normally executed there. While this was a big improvement over the situation in L^AT_EX 2.09 it was not flexible enough for a number of use cases and so packages, such as `etoolbox`, `atveryend` and others patched `\enddocument` to add additional points where code could be hooked into.

Patching using packages is always problematical as leads to conflicts (code availability, ordering of patches, incompatible patches, etc.). For this reason a number of

additional hooks have been added to the `\enddocument` code to allow packages to add code in various places in a controlled way without the need for overwriting or patching the core code.

Supported are now the following hooks (all of them one-time hooks):

enddocument The hook associated with `\AtEndDocument`. It is immediately called at the beginning of `\enddocument`.

When this hook is executed there may be still unprocessed material (e.g., floats on the deferlist) and the hook may add further material to be typeset. After it, `\clearpage` is called to ensure that all such material gets typeset. If there is nothing waiting the `\clearpage` has no effect.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/afterlastpage As the name indicates this hook should not receive code that generates material for further pages. It is the right place to do some final housekeeping and possibly write out some information to the `.aux` file (which is still open at this point to receive data, but since there will be no more pages you need to write to it using `\immediate\write`). It is also the correct place to set up any testing code to be run when the `.aux` file is re-read in the next step.

After this hook has been executed the `.aux` file is closed for writing and then read back in to do some tests (e.g., looking for missing references or duplicated labels, etc.).

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/afteraux At this point, the `.aux` file has been reprocessed and so this is a possible place for final checks and display of information to the user. However, for the latter you might prefer the next hook, so that your information is displayed after the (possibly longish) list of files if that got requested via `\listfiles`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/info This hook is meant to receive code that write final information messages to the terminal. It follows immediately after the previous hook (so both could have been combined, but then packages adding further code would always need to also supply an explicit rule to specify where it should go).

This hook already contains some code added by the kernel (under the labels `kernel/filelist` and `kernel/warnings`), namely the list of files when `\listfiles` has been used and the warnings for duplicate labels, missing references, font substitutions etc.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5).

enddocument/end Finally, this hook is executed just in front of the final call to `\@@end`.

This is a one-time hook, so after it is executed, all further attempts to add code to it will execute such code immediately (see section 2.5). Is it even possible to add code after this one?

There is also the hook `\shipout/lastpage`. This hook is executed as part of the last `\shipout` in the document to allow package to add final `\special`'s to that page. Where this hook is executed in relation to those from the above list can vary from document to document. Furthermore to determine correctly which of the `\shipouts` is the last one, L^AT_EX needs to be run several times, so initially it might get executed on the wrong page. See section 3.4 for where to find the details.

It is in also possible to use the generic `env/document/end` hook which is executed by `\end`, i.e., just in front of the first hook above. Note however that the other generic `\end` environment hook, i.e., `env/document/after` will never get executed, because by that time L^AT_EX has finished the document processing.

3.4 Hooks provided by `\shipout` operations

There are several hooks and mechanisms added to L^AT_EX's process of generating pages. These are documented in `ltshipout-doc.pdf` or with code in `ltshipout-code.pdf`.

3.5 Hooks provided for paragraphs

The paragraph processing has been augmented to include a number of internal and public hooks. These are documented in `ltpara-doc.pdf` or with code in `ltpara-code.pdf`.

3.6 Hooks provided in NFSS commands

In languages that need to support for more than one script in parallel (and thus several sets of fonts, e.g., supporting both Latin and Japanese fonts), NFSS font commands such as `\sffamily` need to switch both the Latin family to “Sans Serif” and in addition alter a second set of fonts.

To support this, several NFSS commands have hooks to which such support can be added.

rmfamily After `\rmfamily` has done its initial checks and prepared a font series update, this hook is executed before `\selectfont`.

sffamily This is like the `rmfamily` hook, but for the `\sffamily` command.

ttfamily This is like the `rmfamily` hook, but for the `\ttfamily` command.

normalfont The `\normalfont` command resets the font encoding, family, series and shape to their document defaults. It then executes this hook and finally calls `\selectfont`.

expand@font@defaults The internal `\expand@font@defaults` command expands and saves the current defaults for the meta families (rm/sf/tt) and the meta series (bf/md). If the NFSS machinery has been augmented, e.g., for Chinese or Japanese fonts, then further defaults may need to be set at this point. This can be done in this hook which is executed at the end of this macro.

bfseries/defaults, bfseries If the `\bfdefault` was explicitly changed by the user, its new value is used to set the bf series defaults for the meta families (rm/sf/tt) when `\bfseries` is called. The `bfseries/defaults` hook allows further adjustments to be made in this case. This hook is only executed if such a change is detected. In contrast, the `bfseries` hook is always executed just before `\selectfont` is called to change to the new series.

mdseries/defaults, **mdseries** These two hooks are like the previous ones but they are in the `\mdseries` command.

selectfont This hook is executed inside `\selectfont`, after the current values for *encoding*, *family*, *series*, *shape*, and *size* are evaluated and the new font is selected (and if necessary loaded). After the hook has executed, NFSS will still do any updates necessary for a new *size* (such as changing the size of `\strut`) and any updates necessary to a change in *encoding*.

This hook is intended for use cases where, in parallel to a change in the main font, some other fonts need to be altered (e.g., in CJK processing where you may need to deal with several different alphabets).

3.7 Hook provided by the mark mechanism

See `ltmarks-doc.pdf` for details.

insertmark This hook allows for a special setup while `\InsertMark` inserts a mark. It is executed in group so local changes only apply to the mark being inserted.

4 The Implementation

```
1  {@@=hook}
2  {*2ekernel | latexrelease}
3  \ExplSyntaxOn
4  {latexrelease}\NewModuleRelease{2020/10/01}{lthooks}
5  {latexrelease}           {The~hook~management~system}
```

4.1 Debugging

`\g_hook_debug_bool` Holds the current debugging state.

```
6  \bool_new:N \g_hook_debug_bool
```

(End definition for `\g_hook_debug_bool`.)

`\hook_debug_on:` Turns debugging on and off by redefining `__hook_debug:n`.

```
7  \cs_new_eq:NN \__hook_debug:n \use_none:n
8  \cs_new_protected:Npn \hook_debug_on:
9  {
10    \bool_gset_true:N \g_hook_debug_bool
11    \__hook_debug_gset:
12  }
13 \cs_new_protected:Npn \hook_debug_off:
14 {
15  \bool_gset_false:N \g_hook_debug_bool
16  \__hook_debug_gset:
17 }
18 \cs_new_protected:Npn \__hook_debug_gset:
19 {
20  \cs_gset_protected:Npx \__hook_debug:n ##1
21  { \bool_if:NT \g_hook_debug_bool {##1} }
22 }
```

(End definition for `\hook_debug_on:` and others. These functions are documented on page 193.)

4.2 Borrowing from internals of other kernel modules

__hook_str_compare:nn Private copy of __str_if_eq:nn
23 \cs_new_eq:NN __hook_str_compare:nn __str_if_eq:nn
(End definition for __hook_str_compare:nn.)

4.3 Declarations

\l__hook_tmpa_bool Scratch boolean used throughout the package.

24 \bool_new:N \l__hook_tmpa_bool
(End definition for \l__hook_tmpa_bool.)

\l__hook_return_tl Scratch variables used throughout the package.

25 \tl_new:N \l__hook_return_tl
26 \tl_new:N \l__hook_tmpa_tl
27 \tl_new:N \l__hook_tmpb_tl

(End definition for \l__hook_return_tl, \l__hook_tmpa_tl, and \l__hook_tmpb_tl.)

\g__hook_all_seq In a few places we need a list of all hook names ever defined so we keep track if them in this sequence.

28 \seq_new:N \g__hook_all_seq
(End definition for \g__hook_all_seq.)

\l__hook_cur_hook_tl Stores the name of the hook currently being sorted.

29 \tl_new:N \l__hook_cur_hook_tl
(End definition for \l__hook_cur_hook_tl.)

\l__hook_work_prop A property list holding a copy of the \g__hook_<hook>_code_prop of the hook being sorted to work on, so that changes don't act destructively on the hook data structure.

30 \prop_new:N \l__hook_work_prop
(End definition for \l__hook_work_prop.)

\g__hook_used_prop All hooks that receive code (for use in debugging display).

31 \prop_new:N \g__hook_used_prop
(End definition for \g__hook_used_prop.)

\g__hook_hook_curr_name_tl \g__hook_name_stack_seq Default label used for hook commands, and a stack to keep track of packages within packages.

32 \tl_new:N \g__hook_hook_curr_name_tl
33 \seq_new:N \g__hook_name_stack_seq

(End definition for \g__hook_hook_curr_name_tl and \g__hook_name_stack_seq.)

__hook_tmp:w Temporary macro for generic usage.

34 \cs_new_eq:NN __hook_tmp:w ?
(End definition for __hook_tmp:w.)

\tl_gremove_once:Nx Some variants of expl3 functions.

\tl_show:x
\tl_log:x

File h: lthooks.dtx

FMi: should probably be moved to expl3

```
35 \cs_generate_variant:Nn \tl_gremove_once:Nn { Nx }
36 \cs_generate_variant:Nn \tl_show:n { x }
37 \cs_generate_variant:Nn \tl_log:n { x }
```

(End definition for \tl_gremove_once:Nx, \tl_show:x, and \tl_log:x.)

\s__hook_mark Scan mark used for delimited arguments.

```
38 \scan_new:N \s__hook_mark
```

(End definition for \s__hook_mark.)

__hook_clean_to_scan:w Removes tokens until the next \s__hook_mark.

```
39 \cs_new:Npn \__hook_clean_to_scan:w #1 \s__hook_mark { }
```

(End definition for __hook_clean_to_scan:w.)

__hook_tl_set:Nn
__hook_tl_set:Nx
__hook_tl_set:cn
__hook_tl_set:cx Private copies of a few expl3 functions. l3debug will only add debugging to the public names, not to these copies, so we don't have to use \debug_suspend: and \debug_resume: everywhere.

Functions like __hook_tl_set:Nn have to be redefined, rather than copied because in expl3 they use __kernel_tl_(g)set:Nx, which is also patched by l3debug.

```
40 \cs_new_protected:Npn \__hook_tl_set:Nn #1#2
41   { \cs_set_nopar:Npx #1 { \__kernel_exp_not:w {#2} } }
42 \cs_new_protected:Npn \__hook_tl_set:Nx #1#2
43   { \cs_set_nopar:Npx #1 {#2} }
44 \cs_generate_variant:Nn \__hook_tl_set:Nn { c }
45 \cs_generate_variant:Nn \__hook_tl_set:Nx { c }
```

(End definition for __hook_tl_set:Nn.)

__hook_tl_gset:Nn Same as above.

```
46 \cs_new_protected:Npn \__hook_tl_gset:Nn #1#2
47   { \cs_gset_nopar:Npx #1 { \__kernel_exp_not:w {#2} } }
48 \cs_new_protected:Npn \__hook_tl_gset:No #1#2
49   { \cs_gset_nopar:Npx #1 { \__kernel_exp_not:w \exp_after:wN {#2} } }
50 \cs_new_protected:Npn \__hook_tl_gset:Nx #1#2
51   { \cs_gset_nopar:Npx #1 {#2} }
52 \cs_generate_variant:Nn \__hook_tl_gset:Nn { c }
53 \cs_generate_variant:Nn \__hook_tl_gset:No { c }
54 \cs_generate_variant:Nn \__hook_tl_gset:Nx { c }
```

(End definition for __hook_tl_gset:Nn.)

__hook_tl_gput_right:Nn Same as above.

```
55 \cs_new_protected:Npn \__hook_tl_gput_right:Nn #1#2
56   { \__hook_tl_gset:Nx #1 { \__kernel_exp_not:w \exp_after:wN { #1 #2 } } }
57 \cs_generate_variant:Nn \__hook_tl_gput_right:Nn { No, cn }
```

(End definition for __hook_tl_gput_right:Nn.)

```

\_\_hook_tl_gput_left:Nn Same as above.
\_\_hook_tl_gput_left:Nn
 58 \cs_new_protected:Npn \_\_hook_tl_gput_left:Nn #1#2
 59 {
 60   \_\_hook_tl_gset:Nx #1
 61   { \_\_kernel_exp_not:w {#2} \_\_kernel_exp_not:w \exp_after:wN {#1} }
 62 }
 63 \cs_generate_variant:Nn \_\_hook_tl_gput_left:Nn { No }

(End definition for \_\_hook_tl_gput_left:Nn.)

\_\_hook_tl_gset_eq:NN Same as above.
 64 \cs_new_eq:NN \_\_hook_tl_gset_eq:NN \tl_gset_eq:NN

(End definition for \_\_hook_tl_gset_eq:NN.)

\_\_hook_tl_gclear:N Same as above.
\_\_hook_tl_gclear:c
 65 \cs_new_protected:Npn \_\_hook_tl_gclear:N #1
 66 { \_\_hook_tl_gset_eq:NN #1 \c_empty_tl }
 67 \cs_generate_variant:Nn \_\_hook_tl_gclear:N { c }

(End definition for \_\_hook_tl_gclear:N.)

```

4.4 Providing new hooks

4.4.1 The data structures of a hook

\g_@@_{hook}_code_prop Hooks have a name (called *<hook>* in the description below) and for each hook we have
 \@@_{hook} to provide a number of data structures. These are
 \@@_{next}_{hook} \g_{hook}_code_prop A property list holding the code for the hook in separate
 chunks. The keys are by default the package names that add code to the hook, but
 it is possible for packages to define other keys.

\g_{hook}_rule_{label1}|{label2}_tl A token list holding the relation between
<label1> and *<label2>* in the *<hook>*. The *<labels>* are lexically (reverse) sorted
 to ensure that two labels always point to the same token list. For global rules, the
<hook> name is ??.

__hook_{hook} The code that is actually executed when the hook is called in the document
 is stored in this token list. It is constructed from the code chunks applying
 the information. This token list is named like that so that in case of an error inside
 the hook, the reported token list in the error is shorter, and to make it simpler to
 normalize hook names in __hook_make_name:n.

\g_{hook}_reversed_tl Some hooks are “reversed”. This token list stores a – for
 such hook so that it can be identified. The – character is used because *<reversed>*1
 is +1 for normal hooks and –1 for reversed ones.

\g_{hook}_declared_tl This token list serves as marker for the hook being officially
 declared. Its existence is tested to raise an error in case another declaration
 is attempted.

`__hook_toplevel_{hook}` This token list stores the code inserted in the hook from the user's document, in the **top-level** label. This label is special, and doesn't participate in sorting. Instead, all code is appended to it and executed after (or before, if the hook is reversed) the normal hook code, but before the **next** code chunk.

`__hook_next_{hook}` Finally there is extra code (normally empty) that is used on the next invocation of the hook (and then deleted). This can be used to define some special behavior for a single occasion from within the document. This token list follows the same naming scheme than the main `__hook_{hook}` token list. It is called `__hook_next_{hook}` rather than `__hook_next_<hook>` because otherwise a hook whose name is `next_<hook>` would clash with the next code-token list of the hook called `<hook>`.

4.4.2 On the existence of hooks

A hook may be in different states of existence. Here we give an overview of the internal commands to set up hooks and explain how the different states are distinguished. The actual implementation then follows in subsequent sections.

One problem we have to solve is that we need to be able to add code to hooks (e.g., with `\AddToHook`) even if that code has not yet been declared. For example, one package needs to write into a hook of another package, but that package may not get loaded, or is loaded only later. Another problem is that most hooks, but not the generic hooks, require a declaration.

We therefore distinguish the following states for a hook, which are managed by four different tests: structure existence (`__hook_if_structure_exist:nTF`), creation (`__hook_if_usable:nTF`), declaration (`__hook_if_declared:nTF`) and disabled or not (`__hook_if_disabled:nTF`)

not existing Nothing is known about the hook so far. This state can be detected with `__hook_if_structure_exist:nTF` (which uses the false branch).

In this state the hook can be declared, disabled, rules can be defined or code could be added to it, but it is not possible to use the hook (with `\UseHook`).

basic data structure set up A hook is in this state when its basic data structure has been set up (using `__hook_init_structure:n`). The data structure setup happens automatically when commands such as `\AddToHook` are used and the hook is at that point in state "not existing".

In this state the four tests give the following results:

```
\_\_hook_if_structure_exist:nTF returns true.  
    \_\_hook_if_usable:nTF returns false.  
    \_\_hook_if_declared:nTF returns false.  
    \_\_hook_if_disabled:nTF returns false.
```

The allowed actions are the same as in the "not existing" state.

declared A hook is in this state it is not disabled and was explicitly declared (e.g., with `\NewHook`). In this case the four tests give the following results:

```
\_\_hook_if_structure_exist:nTF returns true.
```

```

    \_\_hook\_if\_usable:nTF returns true.
    \_\_hook\_if\_declared:nTF returns true.
    \_\_hook\_if\_disabled:nTF returns false.

```

usable A hook is in this state if it is not disabled, was not explicitly declared but nevertheless is allowed to be used (with \UseHook or \hook_use:n). This state is only possible for generic hooks as they do not need to be declared. Therefore such hooks move directly from state “not existing” to “usable” the moment a declaration such as \AddToHook wants to add to the hook data structure. In this state the tests give the following results:

```

\_\_hook\_if\_structure\_exist:nTF returns true.
    \_\_hook\_if\_usable:nTF returns true.
    \_\_hook\_if\_declared:nTF returns false.
    \_\_hook\_if\_disabled:nTF returns false.

```

disabled A generic hook in any state is moved to this state when \DisableGenericHook is used. This changes the tests to give the following results:

```

\_\_hook\_if\_structure\_exist:nTF unchanged.
    \_\_hook\_if\_usable:nTF returns false.
    \_\_hook\_if\_declared:nTF returns true.
    \_\_hook\_if\_disabled:nTF returns true.

```

The structure test is unchanged (if the hook was unknown before it is *false*, otherwise *true*). The usable test returns *false* so that any \UseHook will bypass the hook from now on. The declared test returns *true* so that any further \NewHook generates an error and the disabled test returns *true* so that \AddToHook can return an error.

FMi: maybe it should do this only after begin document?

4.4.3 Setting hooks up

\hook_new:n
__hook_new:n The \hook_new:n declaration declares a new hook and expects the hook *<name>* as its argument, e.g., `begindocument`.

```

68 \cs_new_protected:Npn \hook_new:n #1
69   { \_\_hook_normalize_hook_args:Nn \_\_hook_new:n {#1} }
70 \cs_new_protected:Npn \_\_hook_new:n #1
71   {

```

We check if the hook was already *explicitly* declared with \hook_new:n, and if it already exists we complain, otherwise set the “created” flag for the hook so that it errors next time \hook_new:n is used.

```

72   \_\_hook_if_declared:nTF {#1}
73     { \msg_error:nnn { hooks } { exists } {#1} }
74   {
75     \tl_new:c { g\_hook_{#1}_declared_tl }
76     \_\_hook_make_usable:n {#1}
77   }
78 }

```

(End definition for `\hook_new:n` and `_hook_new:n`. This function is documented on page 191.)

`_hook_make_usable:n` This initializes all hook data structures for the hook but if used on its own doesn't mark the hook as declared (as `\hook_new:n` does, so a later `\hook_new:n` on that hook will not result in an error. This command is internally used by `\hook_gput_code:n` when adding code to a generic hook.

```
79 \cs_new_protected:Npn \_hook_make_usable:n #1
80 {
```

Now we check if the hook's data structure can be safely created without `expl3` raising errors, then we add the hook name to the list of all hooks and allocate the necessary data structures for the new hook, otherwise just do nothing.

```
81     \tl_if_exist:cF { __hook~#1 }
82     {
83         \seq_gput_right:Nn \g__hook_all_seq {#1}
```

This is only used by the actual code of the current hook, so declare it normally:

```
84     \tl_new:c { __hook~#1 }
```

Now ensure that the base data structure for the hook exists:

```
85     \__hook_init_structure:n {#1}
```

The `\g__hook_{hook}_labels_clist` holds the sorted list of labels (once it got sorted). This is used only for debugging.

```
86     \clist_new:c { g__hook_#1_labels_clist }
```

Some hooks should reverse the default order of code chunks. To signal this we have a token list which is empty for normal hooks and contains a `-` for reversed hooks.

```
87     \tl_new:c { g__hook_#1_reversed_tl }
```

The above is all in L3 convention, but we also provide an interface to legacy L^AT_EX 2 ε hooks of the form `\@...hook`, e.g., `\@beginocumenthook`. There have been a few of them and they have been added to using `\g@addto@macro`. If there exists such a macro matching the name of the new hook, i.e., `\@{hook-name}hook` and it is not empty then we add its contents as a code chunk under the label `legacy`.

Warning: this support will vanish in future releases!

```
88     \__hook_include_legacy_code_chunk:n {#1}
89 }
90 }
```

(End definition for `_hook_make_usable:n`)

`_hook_init_structure:n` This function declares the basic data structures for a hook without explicitly declaring the hook itself. This is needed to allow adding to undeclared hooks. Here it is unnecessary to check whether all variables exist, since all three are declared at the same time (either all of them exist, or none).

It creates the hook code pool (`\g__hook_{hook}_code_prop`) and the `top-level` and `next` token lists. A hook is initialized with `_hook_init_structure:n` the first time anything is added to it. Initializing a hook just with `_hook_init_structure:n` will not make it usable with `\hook_use:n`.

```
91 \cs_new_protected:Npn \_hook_init_structure:n #1
92 {
93     \__hook_if_structure_exist:nF {#1}
94     {
```

```

95      \prop_new:c { g__hook_#1_code_prop }
96      \tl_new:c { __hook_toplevel~#1 }
97      \tl_new:c { __hook_next~#1 }
98  }
99 }

```

(End definition for `__hook_init_structure:n`.)

\hook_new_reversed:n
`__hook_new_reversed:n`

Declare a new hook. The default ordering of code chunks is reversed, signaled by setting the token list to a minus sign.

```

100 \cs_new_protected:Npn \hook_new_reversed:n #1
101   { \__hook_normalize_hook_args:Nn \__hook_new_reversed:n {#1} }
102 \cs_new_protected:Npn \__hook_new_reversed:n #1
103   {
104     \__hook_new:n {#1}

```

If the hook already exists the above will generate an error message, so the next line should be executed (but it is — too bad).

```

105   \tl_gset:cn { g__hook_#1_reversed_tl } { - }
106 }

```

(End definition for `\hook_new_reversed:n` and `__hook_new_reversed:n`. This function is documented on page 191.)

\hook_new_pair:nn A shorthand for declaring a normal and a (matching) reversed hook in one go.

```

107 \cs_new_protected:Npn \hook_new_pair:nn #1#2
108   { \hook_new:n {#1} \hook_new_reversed:n {#2} }

```

(End definition for `\hook_new_pair:nn`. This function is documented on page 191.)

`__hook_include_legacy_code_chunk:n` The L^AT_EX legacy concept for hooks uses with hooks the following naming scheme in the code: `\@...hook`.

If this macro is not empty we add it under the label `legacy` to the current hook and then empty it globally. This way packages or classes directly manipulating commands such as `\begindocumenthook` still get their hook data added.

Warning: this support will vanish in future releases!

```

109 \cs_new_protected:Npn \__hook_include_legacy_code_chunk:n #1
110   {

```

If the macro doesn't exist (which is the usual case) then nothing needs to be done.

```

111   \tl_if_exist:cT { @#1hook }

```

Of course if the legacy hook exists but is empty, there is no need to add anything under `legacy` the legacy label.

```

112   {
113     \tl_if_empty:cF { @#1hook }
114   {
115     \exp_args:Nnnv \__hook_hook_gput_code_do:nnn {#1}
116       { legacy } { @#1hook }

```

Once added to the hook, we need to clear it otherwise it might get added again later if the hook data gets updated.

```

117   \__hook_tl_gclear:c { @#1hook }
118   }
119 }
120 }

```

(End definition for `__hook_include_legacy_code_chunk:n`.)

4.4.4 Disabling and providing hooks

`\hook_disable_generic:n` Disables a hook by creating its `\g__hook_<hook>_declared_tl` so that the hook errors when used with `\hook_new:n`, then it undefines `__hook_<hook>` so that it may not be executed.

`__hook_if_disabled:p:n` This does not clear any code that may be already stored in the hook's structure, but doesn't allow adding more code. `__hook_if_disabled:nTF` uses that specific combination to check if the hook is disabled.

```

121  \langle latexrelease \rangle \IncludeInRelease{2021/06/01}%
122  \langle latexrelease \rangle           {\hook_disable_generic:n}{Disable~hooks}
123  \cs_new_protected:Npn \hook_disable_generic:n #1
124    { \__hook_normalize_hook_args:Nn \__hook_disable:n {#1} }
125  \cs_new_protected:Npn \__hook_disable:n #1
126    {
127      \tl_gclear_new:c { g__hook_#1_declared_tl }
128      \cs_undefine:c { __hook~#1 }
129    }
130  \prg_new_conditional:Npnn \__hook_if_disabled:n #1 { p, T, F, TF }
131    {
132      \bool_lazy_and:nnTF
133        { \tl_if_exist_p:c { g__hook_#1_declared_tl } }
134        { ! \tl_if_exist_p:c { __hook~#1 } }
135        { \prg_return_true: }
136        { \prg_return_false: }
137    }
138  \langle latexrelease \rangle \EndIncludeInRelease
139  \langle latexrelease \rangle \IncludeInRelease{2020/10/01}
140  \langle latexrelease \rangle           {\hook_disable_generic:n}{Disable~hooks}
141  \langle latexrelease \rangle
142  \langle latexrelease \rangle \cs_new_protected:Npn \hook_disable_generic:n #1 {}
143  \langle latexrelease \rangle
144  \langle latexrelease \rangle \EndIncludeInRelease

```

(End definition for `\hook_disable_generic:n`, `__hook_disable:n`, and `__hook_if_disabled:nTF`.
This function is documented on page 191.)

`\hook_activate_generic:n` The `\hook_activate_generic:n` declaration declares a new hook if it wasn't declared already, in which case it only checks that the already existing hook is not a reversed hook.

```

145  \langle latexrelease \rangle \IncludeInRelease{2021/06/01}%
146  \langle latexrelease \rangle           {\hook_activate_generic:n}{Providing~hooks}
147  \cs_new_protected:Npn \hook_activate_generic:n #1
148    { \__hook_normalize_hook_args:Nn \__hook_activate_generic:nn {#1} {} }
149  \cs_new_protected:Npn \__hook_activate_generic:nn #1 #2
150    {

```

If the hook to be activated was disabled we warn (for now — this may change).

```

151  \__hook_if_disabled:nTF {#1}
152    { \msg_warning:nnn { hooks } { activate-disabled } {#1} }

```

Otherwise we check if the hook is not declared, and if it isn't, figure out if it's reversed or not, then declare it accordingly.

```

153    {
154      \__hook_if_declared:nF {#1}

```

```

155     {
156         \tl_new:c { g__hook_#1_declared_tl }
157         \__hook_make_usable:n {#1}
158         \tl_gset:cx { g__hook_#1_reversed_tl }
159         { \__hook_if_generic_reversed:nT {#1} { - } }

```

Reflect that we have activated the generic hook and set its execution code.

```

160             \__hook_update_hook_code:n {#1}
161         }
162     }
163 }
```

(End definition for \hook_activate_generic:n and __hook_activate_generic:n. This function is documented on page 192.)

```

164 \end{macro}
165 \end{macro}
166 \end{macro}
167 \end{macro}
168 \end{macro}
169 \end{macro}
170 \end{macro}
```

4.5 Parsing a label

__hook_parse_label default:n
This macro checks if a label was given (not \c_no_value_tl), and if so, tries to parse the label looking for a leading . to replace by __hook_currname_or_default::

```

171 \cs_new:Npn \__hook_parse_label_default:n #1
172 {
173     \tl_if_no_value:nTF {#1}
174     { \__hook_currname_or_default: }
175     { \tl_trim_spaces_apply:nN {#1} \__hook_parse_dot_label:n }
176 }
```

(End definition for __hook_parse_label_default:n.)

__hook_parse_dot_label:n
__hook_parse_dot_label:w
__hook_parse_dot_label_cleanup:w
__hook_parse_dot_label_aux:w
Start by checking if the label is empty, which raises an error, and uses the fallback value. If not, split the label at a ./, if any, and check if no tokens are before the ./, or if the only character is a .. If these requirements are fulfilled, the leading . is replaced with __hook_currname_or_default:. Otherwise the label is returned unchanged.

```

177 \cs_new:Npn \__hook_parse_dot_label:n #1
178 {
179     \tl_if_empty:nTF {#1}
180     {
181         \msg_expandable_error:nn { hooks } { empty-label }
182         \__hook_currname_or_default:
183     }
184     {
185         \str_if_eq:nnTF {#1} { . }
186         { \__hook_currname_or_default: }
187         { \__hook_parse_dot_label:w #1 ./ \s__hook_mark }
188     }
189 }
190 \cs_new:Npn \__hook_parse_dot_label:w #1 ./ #2 \s__hook_mark
```

```

191   {
192     \tl_if_empty:nTF {#1}
193     { \__hook_parse_dot_label_aux:w #2 \s__hook_mark }
194     {
195       \tl_if_empty:nTF {#2}
196       { \__hook_make_name:n {#1} }
197       { \__hook_parse_dot_label_cleanup:w #1 ./ #2 \s__hook_mark }
198     }
199   }
200 \cs_new:Npn \__hook_parse_dot_label_cleanup:w #1 ./ \s__hook_mark {#1}
201 \cs_new:Npn \__hook_parse_dot_label_aux:w #1 ./ \s__hook_mark
202   { \__hook_currname_or_default: / \__hook_make_name:n {#1} }

```

(End definition for `__hook_parse_dot_label:n` and others.)

`__hook_currname_or_default:` This uses `\g__hook_hook_curr_name_tl` if it is set, otherwise it tries `\@currname`. If neither is set, it raises an error and uses the fallback value `label-missing`.

```

203 \cs_new:Npn \__hook_currname_or_default:
204   {
205     \tl_if_empty:NTF \g__hook_hook_curr_name_tl
206     {
207       \tl_if_empty:NTF \@currname
208       {
209         \msg_expandable_error:nnn { latex2e } { should-not-happen }
210         { Empty-default-label. }
211         \__hook_make_name:n { label-missing }
212       }
213       { \@currname }
214     }
215   { \g__hook_hook_curr_name_tl }
216 }

```

(End definition for `__hook_currname_or_default::`)

`__hook_make_name:n`
`__hook_make_name:w` This provides a standard sanitization of a hook's name. It uses `\cs:w` to build a control sequence out of the hook name, then uses `\cs_to_str:N` to get the string representation of that, without the escape character. `\cs:w`-based expansion is used instead of `e`-based because Unicode characters don't behave well inside `\expanded`. The macro adds the `_hook_` prefix to the hook name to reuse the hook's code token list to build the csname and avoid leaving "public" control sequences defined (as `\relax`) in TeX's memory.

```

217 \cs_new:Npn \__hook_make_name:n #1
218   {
219     \exp_after:wN \exp_after:wN \exp_after:wN \__hook_make_name:w
220     \exp_after:wN \token_to_str:N \cs:w __hook~ #1 \cs_end:
221   }
222 \exp_last_unbraced:NNNNo
223 \cs_new:Npn \__hook_make_name:w #1 \tl_to_str:n { __hook~ } { }

```

(End definition for `__hook_make_name:n` and `__hook_make_name:w`.)

`__hook_normalize_hook_args:Nn`
`__hook_normalize_hook_args:Nnn`
`__hook_normalize_hook_rule_args:Nnnnn`
`__hook_normalize_hook_args_aux:Nn` This is the standard route for normalizing hook and label arguments. The main macro does the entire operation within a group so that csnames made by `__hook_make_name:n` are wiped off before continuing. This means that this function cannot be used for `\hook_use:n!`

```

224 \cs_new_protected:Npn \__hook_normalize_hook_args_aux:Nn #1 #2
225   {
226     \group_begin:
227     \use:e
228     {
229       \group_end:
230       \exp_not:N #1 #2
231     }
232   }
233 \cs_new_protected:Npn \__hook_normalize_hook_args:Nn #1 #2
234   {
235     \__hook_normalize_hook_args_aux:Nn #1
236     { { \__hook_parse_label_default:n {#2} } }
237   }
238 \cs_new_protected:Npn \__hook_normalize_hook_args:Nnn #1 #2 #3
239   {
240     \__hook_normalize_hook_args_aux:Nn #1
241     {
242       { \__hook_parse_label_default:n {#2} }
243       { \__hook_parse_label_default:n {#3} }
244     }
245   }
246 \cs_new_protected:Npn \__hook_normalize_hook_rule_args:Nnnnn #1 #2 #3 #4 #5
247   {
248     \__hook_normalize_hook_args_aux:Nn #1
249     {
250       { \__hook_parse_label_default:n {#2} }
251       { \__hook_parse_label_default:n {#3} }
252       { \tl_trim_spaces:n {#4} }
253       { \__hook_parse_label_default:n {#5} }
254     }
255   }

```

(End definition for `__hook_normalize_hook_args:Nn` and others.)

`__hook_curr_name_push:n`
`__hook_curr_name_push_aux:n`
`__hook_curr_name_pop:`
`__hook_end_document_label_check:`

The token list `\g__hook_hook_curr_name_tl` stores the name of the current package/file to be used as the default label in hooks. Providing a consistent interface is tricky because packages can be loaded within packages, and some packages may not use `\SetDefaultHookLabel` to change the default label (in which case `\@currname` is used).

To pull that one off, we keep a stack that contains the default label for each level of input. The bottom of the stack contains the default label for the top-level (this stack should never go empty). If we're building the format, set the default label to be top-level:

```
256 \tl_gset:Nn \g__hook_hook_curr_name_tl { top-level }
```

Then, in case we're in `latexrelease` we push something on the stack to support roll forward. But in some rare cases, `latexrelease` may be loaded inside another package (notably `platexrelease`), so we'll first push the top-level entry:

```
257 ⟨latexrelease⟩\seq_if_empty:NT \g__hook_name_stack_seq
258 ⟨latexrelease⟩ { \seq_gput_right:Nn \g__hook_name_stack_seq { top-level } }
```

then we dissect the `\@currnamestack`, adding `\@currname` to the stack:

```
259 ⟨latexrelease⟩\cs_set_protected:Npn \__hook_tmp:w #1 #2 #3
260 ⟨latexrelease⟩ {
```

```

261 <latexrelease>      \quark_if_recursion_tail_stop:n {#1}
262 <latexrelease>      \seq_gput_right:Nn \g__hook_name_stack_seq {#1}
263 <latexrelease>      \__hook_tmp:w
264 <latexrelease>    }
265 <latexrelease>\exp_after:wN \__hook_tmp:w \@currnamestack
266 <latexrelease>  \q_recursion_tail \q_recursion_tail
267 <latexrelease>  \q_recursion_tail \q_recursion_stop

```

and finally set the default label to be the \@currname:

```

268 <latexrelease>\tl_gset:Nx \g__hook_hook_curr_name_tl { \@currname }
269 <latexrelease>\seq_gpop_right>NN \g__hook_name_stack_seq \l__hook_tma_t1

```

Two commands keep track of the stack: when a file is input, __hook_curr_name_push:n pushes the current default label onto the stack and sets the new default label (all in one go):

```

270 \cs_new_protected:Npn \__hook_curr_name_push:n #1
271   { \exp_args:Nx \__hook_curr_name_push_aux:n { \__hook_make_name:n {#1} } }
272 \cs_new_protected:Npn \__hook_curr_name_push_aux:n #1
273   {
274     \tl_if_blank:nTF {#1}
275       { \msg_error:nn { hooks } { no-default-label } }
276       {
277         \str_if_eq:nnTF {#1} { top-level }
278         {
279           \msg_error:nnnn { hooks } { set-top-level }
280           { to } { PushDefaultHookLabel } {#1}
281         }
282         {
283           \seq_gpush:NV \g__hook_name_stack_seq \g__hook_hook_curr_name_tl
284           \tl_gset:Nn \g__hook_hook_curr_name_tl {#1}
285         }
286       }
287   }

```

and when an input is over, the topmost item of the stack is popped, since that label will not be used again, and \g__hook_hook_curr_name_tl is updated to equal the now topmost item of the stack:

```

288 \cs_new_protected:Npn \__hook_curr_name_pop:
289   {
290     \seq_gpop:NNTF \g__hook_name_stack_seq \l__hook_return_t1
291     { \tl_gset_eq:NN \g__hook_hook_curr_name_tl \l__hook_return_t1 }
292     { \msg_error:nn { hooks } { extra-pop-label } }
293   }

```

At the end of the document we want to check if there was no __hook_curr_name_push:n without a matching __hook_curr_name_pop: (not a critical error, but it might indicate that something else is not quite right):

```

294 \tl_gput_right:Nn \@kernel@after@enddocument@afterlastpage
295   { \__hook_end_document_label_check: }
296 \cs_new_protected:Npn \__hook_end_document_label_check:
297   {
298     \seq_gpop:NNT \g__hook_name_stack_seq \l__hook_return_t1
299     {
300       \msg_error:nnx { hooks } { missing-pop-label }
301       { \g__hook_hook_curr_name_tl }

```

```

302         \tl_gset_eq:NN \g__hook_hook_curr_name_tl \l__hook_return_tl
303         \__hook_end_document_label_check:
304     }
305 }

```

The token list `\g__hook_hook_curr_name_tl` is but a mirror of the top of the stack.

Now define a wrapper that replaces the top of the stack with the argument, and updates `\g__hook_hook_curr_name_tl` accordingly.

```

306 \cs_new_protected:Npn \__hook_set_default_hook_label:n #1
307 {
308     \seq_if_empty:NTF \g__hook_name_stack_seq
309     {
310         \msg_error:nnnn { hooks } { set-top-level }
311         { for } { SetDefaultHookLabel } {#1}
312     }
313     { \exp_args:Nx \__hook_set_default_label:n { \__hook_make_name:n {#1} } }
314 }
315 \cs_new_protected:Npn \__hook_set_default_label:n #1
316 {
317     \str_if_eq:nnTF {#1} { top-level }
318     {
319         \msg_error:nnnn { hooks } { set-top-level }
320         { to } { SetDefaultHookLabel } {#1}
321     }
322     { \tl_gset:Nn \g__hook_hook_curr_name_tl {#1} }
323 }

```

(End definition for `__hook_curr_name_push:n` and others.)

4.6 Adding or removing hook code

With `\hook_gput_code:nnn{<hook>}{{<label>}}{<code>}` a chunk of `<code>` is added to an existing `<hook>` labeled with `<label>`.

```

324 \cs_new_protected:Npn \hook_gput_code:nnn #1 #2
325   { \__hook_normalize_hook_args:Nnn \__hook_gput_code:nnn {#1} {#2} }
326 \cs_new_protected:Npn \__hook_gput_code:nnn #1 #2 #3
327   {

```

First check if the code should be executed immediately, rather than stored:

```

328   \__hook_if_execute_immediately:nTF {#1}
329   {#3}
330   {

```

Then check if the hook is usable.

```

331   \__hook_if_usable:nTF {#1}

```

If so we simply add (or append) the new code to the property list holding different chunks for the hook. At `\begin{document}` this is then sorted into a token list for fast execution.

```

332   {
333     \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}

```

However, if there is an update within the document we need to alter this execution code which is done by `__hook_update_hook_code:n`. In the preamble this does nothing.

```

334   \__hook_update_hook_code:n {#1}
335 }

```

If the hook is not usable, before giving up, check if it's not disabled and otherwise try to declare it as a generic hook, if its name matches one of the valid patterns.

```

336     {
337         \_\_hook\_if\_disabled:nTF {#1}
338             { \msg_error:nnn { hooks } { hook-disabled } {#1} }
339             { \_\_hook\_try\_declaring\_generic\_hook:nnn {#1} {#2} {#3} }
340     }
341 }
342 }
```

This macro will unconditionally add a chunk of code to the given hook.

```

343 \cs_new_protected:Npn \_\_hook_gput_code_do:nnn #1 #2 #3
344 {
```

However, first some debugging info if debugging is enabled:

```

345     \_\_hook_debug:n{ \iow_term:x{****~ Add~ to~
346             \_\_hook_if_usable:nF {#1} { undeclared~ }
347             hook~ #1~ (#2)
348             \on@line\space <-- \tl_to_str:n{#3}} }
```

Then try to get the code chunk labeled #2 from the hook. If there's code already there, then append #3 to that, otherwise just put #3. If the current label is **top-level**, the code is added to a dedicated token list `__hook_toplevel_{hook}` that goes at the end of the hook (or at the beginning, for a reversed hook), just before `__hook_next_{hook}`.

```

349     \str_if_eq:nnTF {#2} { top-level }
350     {
351         \str_if_eq:eeTF { top-level } { \_\_hook_currname_or_default: }
352         {
```

If the hook's basic structure does not exist, we need to declare it with `__hook_init_-structure:n`.

```

353         \_\_hook_init_structure:n {#1}
354         \_\_hook_tl_gput_right:cn { \_\_hook_toplevel~#1 } {#3}
355     }
356     { \msg_error:nnn { hooks } { misused-top-level } {#1} }
357 }
358 {
359     \prop_get:cnNTF { g\_hook\_#1\_code\_prop } {#2} \l\_hook_return_tl
360     {
361         \prop_gput:cno { g\_hook\_#1\_code\_prop } {#2}
362         { \l\_hook_return_tl #3 }
363     }
364     { \prop_gput:cnn { g\_hook\_#1\_code\_prop } {#2} {#3} }
365 }
366 }
```

(End definition for `\hook_gput_code:nnn`, `__hook_gput_code:nnn`, and `__hook_gput_code_do:nnn`. This function is documented on page 192.)

`__hook_gput_undeclared_hook:nnn` Often it may happen that a package *A* defines a hook `foo`, but package *B*, that adds code to that hook, is loaded before *A*. In such case we need to add code to the hook before its declared.

```

367 \cs_new_protected:Npn \_\_hook_gput_undeclared_hook:nnn #1 #2 #3
368 {
369     \_\_hook_init_structure:n {#1}
```

```

370     \__hook_hook_gput_code_do:nnn {#1} {#2} {#3}
371 }

```

(End definition for `__hook_gput_undeclared_hook:nnn`.)

These entry-level macros just pass the arguments along to the common `__hook_try_declarngeneric_hook:nNNnn` with the right functions to execute when some action is to be taken.

The wrapper `__hook_try_declarngeneric_hook:nnn` then defers `\hook_gput_code:nnn` if the generic hook was declared, or to `__hook_gput_undeclared_hook:nnn` otherwise (the hook was tested for existence before, so at this point if it isn't generic, it doesn't exist).

The wrapper `__hook_try_declarngeneric_next_hook:nn` for next-execution hooks does the same: it defers the code to `\hook_gput_next_code:nn` if the generic hook was declared, or to `__hook_gput_next_do:nn` otherwise.

```

372 <|latexrelease>\IncludeInRelease{2021/11/15}{\__hook_try_declarngeneric_hook:nnn}

400 }

```

(End definition for `__hook_try_declarngeneric_hook:nnn` and `__hook_try_declarngeneric_next_hook:nn`.)

`__hook_try_declarngeneric_hook:nNNnn` now splits the hook name at the first / (if any) and first checks if it is a file-specific hook (they require some normalization) using `__hook_if_file_hook:wTF`. If not then check it is one of a predefined set for generic names. We also split off the second component to see if we have to make a reversed hook. In either case the function returns `<true>` for a generic hook and `<false>` in other cases.

```

422     \__hook_if_generic:nTF {#5}
423     {
424       \__hook_if_usable:nF {#5}
425     }

```

If the hook doesn't exist yet we check if it is a cmd hook and if so we attempt patching the command in addition to declaring the hook.

For some commands this will not be possible, in which case __hook_patch_cmd_or_delay:Nnn (defined in ltcmdhooks) will generate an appropriate error message.

```
426   \str_if_eq:nnT {#1} { cmd }
427   { \__hook_try_put_cmd_hook:n {#5} }
```

Declare the hook always even if it can't really be used (error message generated elsewhere).

Here we use __hook_make_usable:n, so that a \hook_new:n is still possible later.

```
428   \__hook_make_usable:n {#5}
429   }
430   \__hook_if_generic_reversed:nT {#5}
431   { \tl_gset:cn { g__hook_#5_reversed_tl } { - } }
432   \prg_return_true:
433   }
434   {
```

Generic hooks are all named $\langle type \rangle / \langle name \rangle / \langle place \rangle$, where $\langle type \rangle$ and $\langle place \rangle$ are predefined ($\c__hook_generic_{\langle type \rangle} / . / \langle place \rangle _{tl}$), and $\langle name \rangle$ is the variable component. Older releases had some hooks with the $\langle name \rangle$ in the third part, so the code below supports that syntax for a while, with a warning.

The `\exp_after:wN ... \exp:w` trick is there to remove the conditional structure inserted by `_hook_try_declarngeneric_hook:wnTF` and thus allow access to the tokens that follow it, as is needed to keep things going.

When the deprecation cycle ends, the lines below should all be replaced by `\prg_return_false:`.

```

435  \_hook_if_deprecated_generic:nTF {##5}
436  {
437      \_hook_DEPRECATED_GENERIC_WARN:n {##5}
438      \exp_after:wN \_hook_DECLARE_DEPRECATED_GENERIC>NNn
439      \exp:w % \exp_end:
440  }
441  { \prg_return_false: }
442 }
443 }
```

`_hook_DEPRECATED_GENERIC_WARN:n` will issue a deprecation warning for a given hook, and mark that hook such that the warning will not be issued again (multiple warnings can be issued, but only once per hook).

```

444 \cs_new_protected:Npn \_hook_DEPRECATED_GENERIC_WARN:n #1
445 { \_hook_DEPRECATED_GENERIC_WARN:w #1 \s__hook_mark }
446 \cs_new_protected:Npn \_hook_DEPRECATED_GENERIC_WARN:w
447 #1 / #2 / #3 \s__hook_mark
448 {
449     \ifcsexist:w __hook~#1/#2/#3 \cs_end: \else:
450         \msg_warning:nnnn { hooks } { generic-deprecated } {##1} {##2} {##3}
451     \fi:
452     \cs_gset_eq:cN { __hook~#1/#2/#3 } \scan_stop:
453 }
```

Now that the user has been told about the deprecation, we proceed by swapping `<name>` and `<place>` and adding the code to the correct hook.

```

592   {cmd=,env=,file=,package=,class=,include=}
593 ⟨latexrelease⟩\EndIncludeInRelease

```

(End definition for `c__hook_generic_cmd./before_tl` and others.)

The following generic hooks are supposed to use reverse ordering (the `ii` and `iii` names are kept for the deprecation cycle):

```

594 ⟨latexrelease⟩\IncludeInRelease{2021/11/15}{\c__hook_genetics_reversed_ii_prop}%
595   ⟨latexrelease⟩          {Standardise-generic~hook~names}
596   \EndIncludeInRelease

```

```

597 〈latexrelease〉\IncludeInRelease{2020/10/01}{\c_hook_generics_reversed_ii_prop}%
598 〈latexrelease〉                                {Standardise-generic~hook~names}
599 〈latexrelease〉\prop_const_from_keyval:Nn \c_hook_generics_reversed_ii_prop {after=,end=}
600 〈latexrelease〉\prop_const_from_keyval:Nn \c_hook_generics_reversed_iii_prop {after=}
601 〈latexrelease〉\prop_const_from_keyval:Nn \c_hook_generics_file_prop {before=,after=}
602 〈latexrelease〉\EndIncludeInRelease

(End definition for \c_hook_generics_reversed_ii_prop, \c_hook_generics_reversed_iii_prop,
and \c_hook_generics_file_prop)

```

\hook_gremove_code:nn With \hook_gremove_code:nn{〈hook〉}{〈label〉} any code for 〈hook〉 stored under 〈label〉 is removed.

```

603 \cs_new_protected:Npn \hook_gremove_code:nn #1 #2
604   { \__hook_normalize_hook_args:Nnn \__hook_gremove_code:nn {#1} {#2} }
605 \cs_new_protected:Npn \__hook_gremove_code:nn #1 #2
606   {

```

First check that the hook code pool exists. __hook_if_usable:nTF isn't used here because it should be possible to remove code from a hook before its defined (see section 2.1.8).

```

607   \__hook_if_structure_exist:nTF {#1}
608   {

```

Then remove the chunk and run __hook_update_hook_code:n so that the execution token list reflects the change if we are after \begin{document}.

If all code is to be removed, clear the code pool \g_hook_〈hook〉_code_prop, the top-level code __hook_toplevel_〈hook〉, and the next-execution code __hook_next_〈hook〉.

```

609   \str_if_eq:nnTF {#2} {*}
610     {
611       \prop_gclear:c { g_hook_#1_code_prop }
612       \__hook_tl_gclear:c { __hook_toplevel~#1 }
613       \__hook_tl_gclear:c { __hook_next~#1 }
614     }
615   {

```

If the label is top-level then clear the token list, as all code there is under the same label.

```

616   \str_if_eq:nnTF {#2} { top-level }
617     { \__hook_tl_gclear:c { __hook_toplevel~#1 } }
618     {
619       \prop_gpop:cnNF { g_hook_#1_code_prop } {#2} \l__hook_return_tl
620       { \msg_warning:nnnn { hooks } { cannot-remove } {#1} {#2} }
621     }
622   }

```

Finally update the code, if the hook exists.

```

623   \__hook_if_usable:nT {#1}
624     { \__hook_update_hook_code:n {#1} }
625   }

```

If the code pool for this hook doesn't exist, show a warning:

```

626   {
627     \__hook_if_deprecated_generic:nTF {#1}
628     {
629       \__hook_DEPRECATED_GENERIC_WARN:n {#1}

```

```

630           \_\_hook\_do\_deprecated\_generic:Nn \_\_hook\_gremove\_code:nn {#1} {#2}
631       }
632   { \msg_warning:nnnn { hooks } { cannot-remove } {#1} {#2} }
633 }
634 }
```

(End definition for `\hook_gremove_code:nn` and `__hook_gremove_code:nn`. This function is documented on page 193.)

`\g__hook_??_code_prop` Initially these variables simply used an empty “label” name (not two question marks).
`__hook~??` This was a bit unfortunate, because then l3doc complains about `__` in the middle of a command name when trying to typeset the documentation. However using a “normal” name such as `default` has the disadvantage of that being not really distinguishable from a real hook name. I now have settled for `??` which needs some gymnastics to get it into the csname, but since this is used a lot, the code should be fast, so this is not done with `c` expansion in the code later on.

`__hook_??` isn’t used, but it has to be defined to trick the code into thinking that `??` is actually a hook.

```

635 \prop_new:c {g__hook_??_code_prop}
636 \prop_new:c {__hook~??}
```

Default rules are always given in normal ordering (never in reversed ordering). If such a rule is applied to a reversed hook it behaves as if the rule is reversed (e.g., `after` becomes `before`) because those rules are applied first and then the order is reversed.

```
637 \tl_new:c {g__hook_??_reversed_tl}
```

(End definition for `\g__hook_??_code_prop`, `__hook~??`, and `\g__hook_??_reversed_tl`.)

4.7 Setting rules for hooks code

`\hook_gset_rule:nnnn` With `\hook_gset_rule:nnnn{<hook>}{<label1>} {<relation>} {<label2>}` a relation is defined between the two code labels for the given `<hook>`. The special hook `??` stands for *any* hook, which sets a default rule (to be used if no other relation between the two hooks exist).

```

638 \cs_new_protected:Npn \hook_gset_rule:nnnn #1#2#3#4
639   {
640     \_\_hook_normalize_hook_rule_args:Nnnnn \_\_hook_gset_rule:nnnn
641     {#1} {#2} {#3} {#4}
642   }
643 (latexrelease)\IncludeInRelease{2022/06/01}{\_\_hook_gset_rule:nnnn}
644 (latexrelease)                                {Refuse~setting~rule~for~one-time~hooks}
645 \cs_new_protected:Npn \_\_hook_gset_rule:nnnn #1#2#3#4
646   {
647     \_\_hook_if_deprecated_generic:nT {#1}
648     {
649       \_\_hook_deprecated_generic_warn:n {#1}
650       \_\_hook_do_deprecated_generic:Nn \_\_hook_gset_rule:nnnn {#1}
651       {#2} {#3} {#4}
652       \_\_hook_clean_to_scan:w
653     }
654     \_\_hook_if_execute_immediately:nT {#1}
655     {
656       \msg_error:nnnnn { hooks } { rule-too-late }
```

```

657          {#1} {#2} {#3} {#4}
658          \_\_hook\_clean\_to\_scan:w
659      }

```

First we ensure the basic data structure of the hook exists:

```

660          \_\_hook\_init\_structure:n {#1}

```

Then we clear any previous relationship between both labels.

```

661          \_\_hook\_rule\_gclear:nnn {#1} {#2} {#4}

```

Then we call the function to handle the given rule. Throw an error if the rule is invalid.

```

662          \cs_if_exist_use:cTF { \_\_hook\_rule\_#3_gset:nnn }
663          {

```

\_\_hook_rule_before_gset:nnn
\_\_hook_rule_after_gset:nnn
\_\_hook_rule_<_gset:nnn
\_\_hook_rule_>_gset:nnn

```

Then we add the new rule. We need to normalize the rules here to allow for faster processing later. Given a pair of labels l_A and l_B , the rule $l_A > l_B$ is the same as $l_B < l_A$ only presented differently. But by normalizing the forms of the rule to a single representation, say, $l_B < l_A$, reduces the time spent looking for the rules later considerably.

Here we do that normalization by using `\(pdf)strcmp` to lexically sort labels l_A and l_B to a fixed order. This order is then enforced every time these two labels are used together.

Here we use `__hook_label_pair:nn {⟨hook⟩} {⟨lA⟩} {⟨lB⟩}` to build a string $l_B \mid l_A$ with a fixed order, and use `__hook_label_ordered:nnTF` to apply the correct rule to the pair of labels, depending if it was sorted or not.

```

698 \cs_new_protected:Npn \_\_hook_rule_before_gset:nnn #1#2#3
699   {
700     \_\_hook_tl_gset:cx { g\_hook\_#1\_rule_ \_\_hook_label_pair:nn {#2} {#3} _tl }

709 \cs_new_eq:cN { \_\_hook_rule_>_gset:nnn } \_\_hook_rule_after_gset:nnn

```

(End definition for `__hook_rule_before_gset:nnn` and others.)

`__hook_rule_voids_gset:nnn`

This rule removes (clears, actually) the code from label #3 if label #2 is in the hook #1.

```

710 \cs_new_protected:Npn \_\_hook_rule_voids_gset:nnn #1#2#3
711   {
712     \_\_hook_tl_gset:cx { g\_hook\_#1\_rule_ \_\_hook_label_pair:nn {#2} {#3} _tl }
713     { \_\_hook_label_ordered:nnTF {#2} {#3} { -> } { <- } }
714   }

```

(End definition for `__hook_rule_voids_gset:nnn`.)

`__hook_rule_incompatible-error_gset:nnn`

`__hook_rule_incompatible-warning_gset:nnn`

These relations make an error/warning if labels #2 and #3 appear together in hook #1.

```

715 \cs_new_protected:cpn { \_\_hook_rule_incompatible-error_gset:nnn } #1#2#3
716   { \_\_hook_tl_gset:cn { g\_hook\_#1\_rule_ \_\_hook_label_pair:nn {#2} {#3} _tl }
717     { xE } }
718 \cs_new_protected:cpn { \_\_hook_rule_incompatible-warning_gset:nnn } #1#2#3
719   { \_\_hook_tl_gset:cn { g\_hook\_#1\_rule_ \_\_hook_label_pair:nn {#2} {#3} _tl }
720     { xW } }

```

(End definition for `__hook_rule_incompatible-error_gset:nnn` and
`__hook_rule_incompatible-warning_gset:nnn`.)

`__hook_rule_unrelated_gset:nnn`

`__hook_rule_gclear:nnn`

Undo a setting. `__hook_rule_unrelated_gset:nnn` doesn't need to do anything, since we use `__hook_rule_gclear:nnn` before setting any rule.

```

721 \cs_new_protected:Npn \_\_hook_rule_unrelated_gset:nnn #1#2#3 { }
722 \cs_new_protected:Npn \_\_hook_rule_gclear:nnn #1#2#3
723   { \cs_undefine:c { g\_hook\_#1\_rule_ \_\_hook_label_pair:nn {#2} {#3} _tl } }

```

(End definition for `__hook_rule_unrelated_gset:nnn` and `__hook_rule_gclear:nnn`.)

`__hook_label_pair:nn`

Ensure that the lexically greater label comes first.

```

724 \cs_new:Npn \_\_hook_label_pair:nn #1#2
725   {
726     \if_case:w \_\_hook_str_compare:nn {#1} {#2} \exp_stop_f:
727       #1 | #1 % 0

```

```

728     \or: #1 | #2 % +1
729     \else: #2 | #1 % -1
730     \fi:
731 }
```

(End definition for `_hook_label_pair:nn`.)

`_hook_label_ordered_p:nn` Check that labels #1 and #2 are in the correct order (as returned by `_hook_label_pair:nn`) and if so return true, else return false.

```

732 \prg_new_conditional:Npn \_hook_label_ordered:nn #1#2 { TF }
733 {
734     \if_int_compare:w \_hook_str_compare:nn {#1} {#2} > 0 \exp_stop_f:
735         \prg_return_true:
736     \else:
737         \prg_return_false:
738     \fi:
739 }
```

(End definition for `_hook_label_ordered:nnTF`.)

`_hook_if_label_case:nnnn` To avoid doing the string comparison twice in `_hook_initialize_single>NNn` (once with `\str_if_eq:nn` and again with `_hook_label_ordered:nn`), we use a three-way branching macro that will compare #1 and #2 and expand to `\use_i:nnn` if they are equal, `\use_ii:nn` if #1 is lexically greater, and `\use_iii:nn` otherwise.

```

740 \cs_new:Npn \_hook_if_label_case:nnnn #1#2
741 {
742     \cs:w use_
743     \if_case:w \_hook_str_compare:nn {#1} {#2}
744         i \or: ii \else: iii \fi: :nnn
745     \cs_end:
746 }
```

(End definition for `_hook_if_label_case:nnnn`.)

`_hook_update_hook_code:n` Before `\begin{document}` this does nothing, in the body it reinitializes the hook code using the altered data.

```
747 \cs_new_eq:NN \_hook_update_hook_code:n \use_none:n
```

(End definition for `_hook_update_hook_code:n`.)

`_hook_initialize_all:` Initialize all known hooks (at `\begin{document}`), i.e., update the fast execution token lists to hold the necessary code in the right order.

```
748 \cs_new_protected:Npn \_hook_initialize_all: {
```

First we change `_hook_update_hook_code:n` which so far was a no-op to now initialize one hook. This way any later updates to the hook will run that code and also update the execution token list.

```
749     \cs_gset_eq:NN \_hook_update_hook_code:n \_hook_initialize_hook_code:n
```

Now we loop over all hooks that have been defined and update each of them.

```

750     \_hook_debug:n { \prop_gclear:N \g__hook_used_prop }
751     \seq_map_inline:Nn \g__hook_all_seq
752     {
753         \_hook_update_hook_code:n {##1}
754     }
```

If we are debugging we show results hook by hook for all hooks that have data.

```

755   \__hook_debug:n
756   { \iow_term:x{^JAll~ initialized~ (non-empty)~ hooks:}
757     \prop_map_inline:Nn \g__hook_used_prop
758     { \iow_term:x{^J~ ##1~ ->~
759       \exp_not:v {__hook##1}~ }
760     }
761   }

```

After all hooks are initialized we change the “use” to just call the hook code and not initialize it (as it was done in the preamble).

```

762   \cs_gset_eq:NN \hook_use:n \__hook_use_initialized:n
763   \cs_gset_eq:NN \__hook_preamble_hook:n \use_none:n
764 }

```

(End definition for __hook_initialize_all:.)

__hook_initialize_hook_code:n Initializing or reinitializing the fast execution hook code. In the preamble this is selectively done in case a hook gets used and at \begin{document} this is done for all hooks and afterwards only if the hook code changes.

```

765 \cs_new_protected:Npn \__hook_initialize_hook_code:n #1
766 {
767   \__hook_debug:n
768   { \iow_term:x { ^J Update~code~for~hook~'##1' \on@line :^J } }

```

This does the sorting and the updates. First thing we do is to check if a legacy hook macro exists and if so we add it to the hook under the label `legacy`. This might make the hook non-empty so we have to do this before the then following test.

```
769   \__hook_include_legacy_code_chunk:n {#1}
```

If there aren’t any code chunks for the current hook, there is no point in even starting the sorting routine so we make a quick test for that and in that case just update __hook_{hook} to hold the top-level and next code chunks. If there are code chunks we call __hook_initialize_single:NNn and pass to it ready made csnames as they are needed several times inside. This way we save a bit on processing time if we do that up front.

```

770 \__hook_if_usable:nT {#1}
771 {
772   \prop_if_empty:cTF { g__hook##1_code_prop }
773   {
774     \__hook_tl_gset:co { __hook##1 }
775     {
776       \cs:w __hook_toplevel##1 \exp_after:wN \cs_end:
777       \cs:w __hook_next##1 \cs_end:
778     }
779   }
780 }
```

By default the algorithm sorts the code chunks and then saves the result in a token list for fast execution; this is done by adding the code chunks one after another, using \tl_gput_right:NV. When we sort code for a reversed hook, all we have to do is to add the code chunks in the opposite order into the token list. So all we have to do in preparation is to change two definitions that are used later on.

```
781   \__hook_if_reversed:nTF {#1}
```

```

782     { \cs_set_eq:NN \__hook_tl_gput:Nn      \__hook_tl_gput_left:Nn
783         \cs_set_eq:NN \__hook_clist_gput:NV \clist_gput_left:NV }
784     { \cs_set_eq:NN \__hook_tl_gput:Nn      \__hook_tl_gput_right:Nn
785         \cs_set_eq:NN \__hook_clist_gput:NV \clist_gput_right:NV }

```

When sorting, some relations (namely `voids`) need to act destructively on the code property lists to remove code that shouldn't appear in the sorted hook token list, so we make a copy of the code property list that we can safely work on without changing the main one.

```

786     \prop_set_eq:Nc \l_hook_work_prop { g_hook#1_code_prop }
787     \hook_initialize_single:ccn
788     { __hook~#1 } { g_hook#1_labels_clist } {#1}

```

For debug display we want to keep track of those hooks that actually got code added to them, so we record that in plist. We use a plist to ensure that we record each hook name only once, i.e., we are only interested in storing the keys and the value is arbitrary.

```

789     \hook_debug:n
790     { \exp_args:NNx \prop_gput:Nnn \g_hook_used_prop {#1} { } }
791   }
792 }
793 }

```

(End definition for `\hook_initialize_hook_code:n`.)

`\hook_tl_csname:n`
`\hook_seq_csname:n`

It is faster to pass a single token and expand it when necessary than to pass a bunch of character tokens around.

FMi: note to myself: verify

```

794 \cs_new:Npn \hook_tl_csname:n #1 { \l_hook_label_#1_tl }
795 \cs_new:Npn \hook_seq_csname:n #1 { \l_hook_label_#1_seq }

```

(End definition for `\hook_tl_csname:n` and `\hook_seq_csname:n`.)

`\l_hook_labels_seq`
`\l_hook_labels_int`
`\l_hook_front_tl`
`\l_hook_rear_tl`
`\l_hook_label_0_tl`

For the sorting I am basically implementing Knuth's algorithm for topological sorting as given in TAOCP volume 1 pages 263–266. For this algorithm we need a number of local variables:

- List of labels used in the current hook to label code chunks:

```

796 \seq_new:N \l_hook_labels_seq

```

- Number of labels used in the current hook. In Knuth's algorithm this is called N :

```

797 \int_new:N \l_hook_labels_int

```

- The sorted code list to be build is managed using two pointers one to the front of the queue and one to the rear. We model this using token list pointers. Knuth calls them F and R :

```

798 \tl_new:N \l_hook_front_tl
799 \tl_new:N \l_hook_rear_tl

```

- The data for the start of the queue is kept in this token list, it corresponds to what Don calls `QLINK[0]` but since we aren't manipulating individual words in memory it is slightly differently done:

```
800     \tl_new:c { \__hook_tl_cname:n { 0 } }
```

(End definition for `\l_hook_labels_seq` and others.)

`__hook_initialize_single:Nn` and `__hook_initialize_single:ccn` implements the sorting of the code chunks for a hook and saves the result in the token list for fast execution (#4). The arguments are `<hook-code-plist>`, `<hook-code-tl>`, `<hook-top-level-code-tl>`, `<hook-next-code-tl>`, `<hook-ordered-labels-clist>` and `<hook-name>` (the latter is only used for debugging—the `<hook-rule-plist>` is accessed using the `<hook-name>`).

The additional complexity compared to Don's algorithm is that we do not use simple positive integers but have arbitrary alphanumeric labels. As usual Don's data structures are chosen in a way that one can omit a lot of tests and I have mimicked that as far as possible. The result is a restriction I do not test for at the moment: a label can't be equal to the number 0!

FMi: Needs checking for, just in case ... maybe

```
801 \cs_new_protected:Npn \__hook_initialize_single:Nn #1#2#3
802 {
```

Step T1: Initialize the data structure ...

```
803     \seq_clear:N \l_hook_labels_seq
804     \int_zero:N \l_hook_labels_int
```

Store the name of the hook:

```
805     \tl_set:Nn \l_hook_cur_hook_tl {#3}
```

We loop over the property list holding the code and record all the labels listed there. Only the rules for those labels are of interest to us. While we are at it we count them (which gives us the N in Knuth's algorithm). The prefix `label_` is added to the variables to ensure that labels named `front`, `rear`, `labels`, or `return` don't interact with our code.

```
806     \prop_map_inline:Nn \l_hook_work_prop
807     {
808         \int_incr:N \l_hook_labels_int
809         \seq_put_right:Nn \l_hook_labels_seq {##1}
810         \__hook_tl_set:cn { \__hook_tl_cname:n {##1} } { 0 }
811         \seq_clear_new:c { \__hook_seq_cname:n {##1} }
812     }
```

Steps T2 and T3: Here we sort the relevant rules into the data structure...

This loop constitutes a square matrix of the labels in `\l_hook_work_prop` in the vertical and the horizontal directions. However, since the rule $l_A \langle rel \rangle l_B$ is the same as $l_B \langle rel \rangle^{-1} l_A$ we can cut the loop short at the diagonal of the matrix (*i.e.*, when both labels are equal), saving a good amount of time. The way the rules were set up (see the implementation of `__hook_rule_before_gset:nnn` above) ensures that we have no rule in the ignored side of the matrix, and all rules are seen. The rules are applied in `__hook_apply_label_pair:nnn`, which takes the properly-ordered pair of labels as argument.

```
813     \prop_map_inline:Nn \l_hook_work_prop
814     {
```

```

815     \prop_map_inline:Nn \l__hook_work_prop
816     {
817         \_hook_if_label_case:nnnn {##1} {####1}
818         { \prop_map_break: }
819         { \_hook_apply_label_pair:nnn {##1} {####1} }
820         { \_hook_apply_label_pair:nnn {####1} {##1} }
821         {##3}
822     }
823 }
```

Now take a breath, and look at the data structures that have been set up:

```
824     \_hook_debug:n { \_hook_debug_label_data:N \l__hook_work_prop }
```

Step T4:

```

825     \tl_set:Nn \l__hook_rear_tl { 0 }
826     \tl_set:cn { \_hook_tl_cname:n { 0 } } { 0 }
827     \seq_map_inline:Nn \l__hook_labels_seq
828     {
829         \int_compare:nNnT { \cs:w \_hook_tl_cname:n {##1} \cs_end: } = 0
830         {
831             \tl_set:cn { \_hook_tl_cname:n { \l__hook_rear_tl } }{##1}
832             \tl_set:Nn \l__hook_rear_tl {##1}
833         }
834     }
835     \tl_set_eq:Nc \l__hook_front_tl { \_hook_tl_cname:n { 0 } }
836     \_hook_tl_gclear:N #1
837     \clist_gclear:N #2
```

The whole loop gets combined in steps T5–T7:

```
838     \bool_while_do:nn { ! \str_if_eq_p:Vn \l__hook_front_tl { 0 } }
839     {
```

This part is step T5:

```

840     \int_decr:N \l__hook_labels_int
841     \prop_get:NVN \l__hook_work_prop \l__hook_front_tl \l__hook_return_tl
842     \exp_args:NNV \_hook_tl_gput:Nn #1 \l__hook_return_tl
843     \_hook_clist_gput:NV #2 \l__hook_front_tl
844     \_hook_debug:n{ \iow_term:x{Handled~ code~ for~ \l__hook_front_tl} }
```

This is step T6, except that we don't use a pointer P to move through the successors, but instead use ##1 of the mapping function.

```

845     \seq_map_inline:cn { \_hook_seq_cname:n { \l__hook_front_tl } }
846     {
847         \tl_set:cx { \_hook_tl_cname:n {##1} }
848         { \int_eval:n
849             { \cs:w \_hook_tl_cname:n {##1} \cs_end: - 1 }
850         }
851         \int_compare:nNnT
852             { \cs:w \_hook_tl_cname:n {##1} \cs_end: } = 0
853             {
854                 \tl_set:cn { \_hook_tl_cname:n { \l__hook_rear_tl } }{##1}
855                 \tl_set:Nn \l__hook_rear_tl {##1}
856             }
857     }
```

and here is step T7:

```
858     \tl_set_eq:Nc \l__hook_front_tl
859         { \__hook_tl_cname:n { \l__hook_front_tl } }
```

This is step T8: If we haven't moved the code for all labels (i.e., if `\l__hook_labels_int` is still greater than zero) we have a loop and our partial order can't be flattened out.

```
860     }
861     \int_compare:nNnF \l__hook_labels_int = 0
862     {
863         \iow_term:x{=====}
864         \iow_term:x{Error:~ label~ rules~ are~ incompatible:}
```

This is not really the information one needs in the error case but it will do for now
...

FMi: improve output on a rainy day

```
865     \__hook_debug_label_data:N \l__hook_work_prop
866     \iow_term:x{=====}
867 }
```

After we have added all hook code to #1, we finish it off by adding extra code for the top-level (#2) and for one time execution (#3). These should normally be empty. The top-level code is added with `__hook_tl_gput:Nn` as that might change for a reversed hook (then top-level is the very first code chunk added). The next code is always added last.

```
868     \exp_args:NNo \__hook_tl_gput:Nn #1 { \cs:w __hook_toplevel~#3 \cs_end: }
869     \__hook_tl_gput_right:Nn #1 { \cs:w __hook_next~#3 \cs_end: }
870 }
871 \cs_generate_variant:Nn \__hook_initialize_single:NNn { cc }
```

(End definition for `__hook_initialize_single:NNn`.)

`__hook_tl_gput:Nn`
`__hook_clist_gput:NV`

```
872 \cs_new:Npn \__hook_tl_gput:Nn { \ERROR }
873 \cs_new:Npn \__hook_clist_gput:NV { \ERROR }
```

(End definition for `__hook_tl_gput:Nn` and `__hook_clist_gput:NV`.)

This is the payload of steps T2 and T3 executed in the loop described above. This macro assumes #1 and #2 are ordered, which means that any rule pertaining the pair #1 and #2 is `\g__hook_<hook>_rule_#1|#2_t1`, and not `\g__hook_<hook>_rule_#2|#1_t1`. This also saves a great deal of time since we only need to check the order of the labels once.

The arguments here are `<label1>`, `<label2>`, `<hook>`, and `<hook-code-plist>`. We are about to apply the next rule and enter it into the data structure. `__hook_apply_label_pair:nnn` will just call `__hook_label_if_exist_apply:nnmF` for the `<hook>`, and if no rule is found, also try the `<hook>` name ?? denoting a default hook rule.

`__hook_label_if_exist_apply:nnmF` will check if the rule exists for the given hook, and if so call `__hook_apply_rule:nnn`.

```
874 \cs_new_protected:Npn \__hook_apply_label_pair:nnn #1#2#3
875 {
```

Extra complication: as we use default rules and local hook specific rules we first have to check if there is a local rule and if that exist use it. Otherwise check if there is a default rule and use that.

```
876     \_\_hook\_label\_if\_exist\_apply:nnnF {#1} {#2} {#3}
877     {

```

If there is no hook-specific rule we check for a default one and use that if it exists.

```
878         \_\_hook\_label\_if\_exist\_apply:nnnF {#1} {#2} { ?? } { }
879     }
880   }
881 \cs_new_protected:Npn \_\_hook\_label\_if\_exist\_apply:nnnF #1#2#3
882   {
883     \if_cs_exist:w g\_\_hook\_ #3 _rule\_ #1 | #2 _tl \cs_end:

```

What to do precisely depends on the type of rule we have encountered. If it is a `before` rule it will be handled by the algorithm but other types need to be managed differently. All this is done in `__hook_apply_rule:nnnN`.

```
884     \_\_hook\_apply\_rule:nnn {#1} {#2} {#3}
885     \exp_after:wN \use_none:n
886   \else:
887     \use:nn
888   \fi:
889 }

(End definition for \_\_hook_apply_label_pair:nnn and \_\_hook_label_if_exist_apply:nnnF.)
```

__hook_apply_rule:nnn

This is the code executed in steps T2 and T3 while looping through the matrix. This is part of step T3. We are about to apply the next rule and enter it into the data structure. The arguments are $\langle label1 \rangle$, $\langle label2 \rangle$, $\langle hook-name \rangle$, and $\langle hook-code-plist \rangle$.

```
890 \cs_new_protected:Npn \_\_hook_apply_rule:nnn #1#2#3
891   {
892     \cs:w __hook_apply_
893     \cs:w g\_\_hook\_#3_reversed_tl \cs_end: rule_
894     \cs:w g\_\_hook\_ #3 _rule\_ #1 | #2 _tl \cs_end: :nnn \cs_end:
895     {#1} {#2} {#3}
896   }

(End definition for \_\_hook_apply_rule:nnn.)
```

__hook_apply_rule_<:nnn __hook_apply_rule_>:nnn

The most common cases are `<` and `>` so we handle that first. They are relations \prec and \succ in TAOCP, and they dictate sorting.

```
897 \cs_new_protected:cpx { __hook_apply_rule_<:nnn } #1#2#3
898   {
899     \_\_hook_debug:n { \_\_hook_msg_pair_found:nnn {#1} {#2} {#3} }
900     \tl_set:cx { \_\_hook_tl_cname:n {#2} }
901     { \int_eval:n{ \cs:w \_\_hook_tl_cname:n {#2} \cs_end: + 1 } }
902     \seq_put_right:cn{ \_\_hook_seq_cname:n {#1} }{#2}
903   }
904 \cs_new_protected:cpx { __hook_apply_rule_>:nnn } #1#2#3
905   {
906     \_\_hook_debug:n { \_\_hook_msg_pair_found:nnn {#1} {#2} {#3} }
907     \tl_set:cx { \_\_hook_tl_cname:n {#1} }
908     { \int_eval:n{ \cs:w \_\_hook_tl_cname:n {#1} \cs_end: + 1 } }
909     \seq_put_right:cn{ \_\_hook_seq_cname:n {#2} }{#1}
910   }
```

(End definition for `_hook_apply_rule_<:nnn` and `_hook_apply_rule_>:nnn`.)

```
\_hook_apply_rule_xE:nnn  
\_hook_apply_rule_xW:nnn
```

These relations make two labels incompatible within a hook. `xE` makes raises an error if the labels are found in the same hook, and `xW` makes it a warning.

```
911 \cs_new_protected:cpn { \_hook_apply_rule_xE:nnn } #1#2#3  
912 {  
913     \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }  
914     \msg_error:nnnnn { hooks } { labels-incompatible }  
915     {#1} {#2} {#3} { 1 }  
916     \use:c { \_hook_apply_rule_->:nnn } {#1} {#2} {#3}  
917     \use:c { \_hook_apply_rule_-<:nnn } {#1} {#2} {#3}  
918 }  
919 \cs_new_protected:cpn { \_hook_apply_rule_xW:nnn } #1#2#3  
920 {  
921     \_hook_debug:n { \_hook_msg_pair_found:nnn {#1} {#2} {#3} }  
922     \msg_warning:nnnnn { hooks } { labels-incompatible }  
923     {#1} {#2} {#3} { 0 }  
924 }
```

(End definition for `_hook_apply_rule_xE:nnn` and `_hook_apply_rule_xW:nnn`.)

```
\_hook_apply_rule_->:nnn  
\_hook_apply_rule_-<:nnn
```

If we see `->` we have to drop code for label `#3` and carry on. We could do a little better and drop everything for that label since it doesn't matter where we put such empty code. However that would complicate the algorithm a lot with little gain.¹⁰ So we still unnecessarily try to sort it in and depending on the rules that might result in a loop that is otherwise resolved. If that turns out to be a real issue, we can improve the code.

Here the code is removed from `\l_hook_cur_hook_t1` rather than `#3` because the latter may be `??`, and the default hook doesn't store any code. Removing it instead from `\l_hook_cur_hook_t1` makes the default rules `->` and `<-` work properly.

```
925 \cs_new_protected:cpn { \_hook_apply_rule_->:nnn } #1#2#3  
926 {  
927     \_hook_debug:n  
928     {  
929         \_hook_msg_pair_found:nnn {#1} {#2} {#3}  
930         \iow_term:x{---~ Drop~ '#2'~ code~ from~  
931         \iow_char:N \\ g_hook_\l_hook_cur_hook_t1 _code_prop ~  
932         because~ of~ '#1' }  
933     }  
934     \prop_put:Nnn \l_hook_work_prop {#2} { }  
935 }  
936 \cs_new_protected:cpn { \_hook_apply_rule_-<:nnn } #1#2#3  
937 {  
938     \_hook_debug:n  
939     {  
940         \_hook_msg_pair_found:nnn {#1} {#2} {#3}  
941         \iow_term:x{--->~ Drop~ '#1'~ code~ from~  
942         \iow_char:N \\ g_hook_\l_hook_cur_hook_t1 _code_prop ~  
943         because~ of~ '#2' }  
944     }  
945     \prop_put:Nnn \l_hook_work_prop {#1} { }  
946 }
```

¹⁰This also has the advantage that the result of the sorting doesn't change, as it might otherwise do (for unrelated chunks) if we aren't careful.

(End definition for `_hook_apply_rule_->:nnn` and `_hook_apply_rule_-<-:nnn`.)

```
\_\_hook\_apply\_rule_<:nnn  
\_\_hook\_apply\_rule_>:nnn  
\_\_hook\_apply\_rule_<:nnn  
\_\_hook\_apply\_rule_->:nnn  
\_\_hook\_apply\_rule_xW:nnn  
\_\_hook\_apply\_rule_xE:nnn
```

Reversed rules.

```
947 \cs_new_eq:cc { __hook_apply_rule_<:nnn } { __hook_apply_rule_>:nnn }
948 \cs_new_eq:cc { __hook_apply_rule_>:nnn } { __hook_apply_rule_<:nnn }
949 \cs_new_eq:cc { __hook_apply_rule_<:-nnn } { __hook_apply_rule_<:-nnn }
950 \cs_new_eq:cc { __hook_apply_rule_->:nnn } { __hook_apply_rule_->:nnn }
951 \cs_new_eq:cc { __hook_apply_rule_xE:nnn } { __hook_apply_rule_xE:nnn }
952 \cs_new_eq:cc { __hook_apply_rule_xW:nnn } { __hook_apply_rule_xW:nnn }
```

(End definition for `_hook_apply_rule_<:nnn` and others.)

__hook_msg_pair_found:nnn

A macro to avoid moving this many tokens around.

```
953 \cs_new_protected:Npn \__hook_msg_pair_found:nnn #1#2#3
954 {
955     \iow_term:x{\str_if_eq:nnTF {#3} {??} {default} {-normal} ~
956         rule~\__hook_label_pair:nn {#1} {#2}:~}
957         \use:c {g__hook_#3_rule_ \__hook_label_pair:nn {#1} {#2} _tl } ~
958         found}
959 }
```

(End definition for __hook_msg_pair_found:nnn.)

__hook_debug_label_data:N

```
960 \cs_new_protected:Npn \__hook_debug_label_data:N #1 {
961   \iow_term:x{Code~ labels~ for~ sorting:}
962   \iow_term:x{\seq_use:Nnnn\l__hook_labels_seq {~and~}{,~}{~and~} }
963   \iow_term:x{^J Data~ structure~ for~ label~ rules:}
964   \prop_map_inline:Nn #1
965   {
966     \iow_term:x{##1~ =~ \tl_use:c{ \__hook_tl_cname:n {##1} }~ ->~}
967     \seq_use:cnnn{ \__hook_seq_cname:n {##1} }{~->-}{~->~}{~->~}
968   }
969 }
970 \iow_term:x{}
```

(End definition for __hook_debug_label_data:N.)

\hook_show:n
\hook_log:n

This writes out information about the hook given in its argument onto the `.log` file and the terminal, if `\show_hook:n` is used. Internally both share the same structure, except that at the end, `\hook show:n` triggers T_EX's prompt.

```
\__hook_log_line_indent:x 972 \cs_new_protected:Npn \hook_log:n #1
\__hook_log:nN 973 {
    \cs_set_eq:NN \__hook_log_cmd:x \iow_log:x

To display the code for next invocation only (i.e., from `\AddToHookNext` we have to remove the first two tokens at the front which are `\tl_gclear:N` and the token list to clear.

```
1077 \cs_new:Npn \__hook_log_next_code:n #1
```

`__hook_log_next_code:n`

File h: lthooks.dtx

```
1078 { \exp_args:No \tl_to_str:n { \use_none:nn #1 } }
```

(End definition for `\hook_show:n` and others. These functions are documented on page 193.)

This macro takes a `\hook` and an `inline function` and loops through each pair of `labels` in the `\hook`, and if there is a relation between this pair of `labels`, the `inline function` is executed with `#1 = <relation>`, `#2 = <label1> | <label2>`, and `#3 = <hook>` (the latter may be the argument `#1` to `_hook_list_rules:nn`, or `??` if it is a default rule).

```
1079 \cs_new_protected:Npn \_hook_list_rules:nn #1 #2
1080   {
1081     \cs_set_protected:Npn \_hook_tmp:w ##1 ##2 ##3 {#2}
1082     \prop_map_inline:cn { g__hook_#1_code_prop }
1083     {
1084       \prop_map_inline:cn { g__hook_#1_code_prop }
1085       {
1086         \_hook_if_label_case:nnnn {##1} {####1}
1087         { \prop_map_break: }
1088         { \_hook_list_one_rule:nnn {##1} {####1} }
1089         { \_hook_list_one_rule:nnn {####1} {##1} }
1090         {#1}
1091       }
1092     }
1093   }
```

These two are quite similar to `_hook_apply_label_pair:nnn` and `_hook_label_if_exist_apply:nnnF`, respectively, but rather than applying the rule, they pass it to the `inline function`.

```
1094 \cs_new_protected:Npn \_hook_list_one_rule:nnn #1#2#3
1095   {
1096     \_hook_list_if_rule_exists:nnnF {#1} {#2} {#3}

1098   }
1099 \cs_new_protected:Npn \_hook_list_if_rule_exists:nnnF #1#2#3
1100   {
1101     \if_cs_exist:w g__hook_ #3 _rule_ #1 | #2 _tl \cs_end:
1102     \exp_args:Nv \_hook_tmp:w
1103     { g__hook_ #3 _rule_ #1 | #2 _tl } { #1 | #2 } {#3}
1104     \exp_after:wN \use_none:nn
1105   \fi:
1106   \use:n
1107 }
```

(End definition for `_hook_list_rules:nn`, `_hook_list_one_rule:nnn`, and `_hook_list_if_rule_exists:nnnF`.)

`_hook_debug_print_rules:n` A shorthand for debugging that prints similar to `\prop_show:N`.

```
1108 \cs_new_protected:Npn \_hook_debug_print_rules:n #1
1109   {
1110     \iow_term:n { The~hook~#1~contains~the~rules: }
1111     \cs_set_protected:Npn \_hook_tmp:w ##1
1112     {
1113       \_hook_list_rules:nn {#1}
1114       {
1115         \iow_term:x
1116         {
```

```

1117          > ##1 {####2} ##1 => ##1 {####1}
1118          \str_if_eq:nnt {####3} {??} { ~ (default) }
1119      }
1120    }
1121  }
1122 \exp_args:No \__hook_tmp:w { \use:nn { ~ } { ~ } }
1123 }

```

(End definition for `__hook_debug_print_rules:n`.)

4.8 Specifying code for next invocation

`\hook_gput_next_code:nn`

```

1124 \cs_new_protected:Npn \hook_gput_next_code:nn #1
1125   { \__hook_normalize_hook_args:Nn \__hook_gput_next_code:nn {#1} }

```

(End definition for `\hook_gput_next_code:nn`. This function is documented on page 192.)

```

\__hook_gput_next_code:nn
\__hook_gput_next_do:nn
\__hook_gput_next_do:Nnn
1126 \cs_new_protected:Npn \__hook_gput_next_code:nn #1 #2
1127  {
1128    \__hook_if_disabled:nTF {#1}
1129    { \msg_error:nnn { hooks } { hook-disabled } {#1} }
1130    {
1131      \__hook_if_structure_exist:nTF {#1}
1132      { \__hook_gput_next_do:nn {#1} {#2} }
1133      { \__hook_try_declarngeneric_next_hook:nn {#1} {#2} }
1134    }
1135  }
1136 \cs_new_protected:Npn \__hook_gput_next_do:nn #1
1137  {
1138    \exp_args:Nc \__hook_gput_next_do:Nnn
1139    { __hook_next~#1 } {#1}
1140  }

```

First check if the “next code” token list is empty: if so we need to add a `\tl_gclear:c` to clear it, so the code lasts for one usage only. The token list is cleared early so that nested usages don’t get lost. `\tl_gclear:c` is used instead of `\tl_gclear:N` in case the hook is used in an expansion-only context, so the token list doesn’t expand before `\tl_gclear:N`: that would make an infinite loop. Also in case the main code token list is empty, the hook code has to be updated to add the next execution token list.

```

1141 \cs_new_protected:Npn \__hook_gput_next_do:Nnn #1 #2
1142  {
1143    \tl_if_empty:cT { __hook~#2 }
1144    { \__hook_update_hook_code:n {#2} }
1145    \tl_if_empty:NT #1
1146    { \__hook_tl_gset:Nn #1 { \__hook_clear_next:n {#2} } }
1147    \__hook_tl_gput_right:Nn #1
1148  }

```

(End definition for `__hook_gput_next_code:nn`, `__hook_gput_next_do:nn`, and `__hook_gput_next_do:Nnn`.)

```
\hook_gclear_next_code:n Discard anything set up for next invocation of the hook.
\__hook_clear_next:n
1149 \cs_new_protected:Npn \hook_gclear_next_code:n #1
1150   { \__hook_normalize_hook_args:Nn \__hook_clear_next:n {#1} }
1151 \cs_new_protected:Npn \__hook_clear_next:n #1
1152   { \cs_gset_eq:cN { __hook_next~#1 } \c_empty_tl }

(End definition for \hook_gclear_next_code:n and \__hook_clear_next:n. This function is
documented on page 192.)
```

4.9 Using the hook

\hook_use:n as defined here is used in the preamble, where hooks aren't initialized by default. __hook_use_initialized:n is also defined, which is the non-\protected version for use within the document. Their definition is identical, except for the __hook_preamble_hook:n (which wouldn't hurt in the expandable version, but it would be an unnecessary extra expansion).

__hook_use_initialized:n holds the expandable definition while in the preamble. __hook_preamble_hook:n initializes the hook in the preamble, and is redefined to \use_none:n at \begin{document}.

Both versions do the same thing internally: they check that the hook exists as given, and if so they use it as quickly as possible.

At \begin{document}, all hooks are initialized, and any change in them causes an update, so \hook_use:n can be made expandable. This one is better not protected so that it can expand into nothing if containing no code. Also important in case of generic hooks that we do not generate a \relax as a side effect of checking for a csname. In contrast to the TeX low-level \csname ... \endcsname construct \tl_if_exist:c is careful to avoid this.

```
1153 ⟨latexrelease⟩\IncludeInRelease{2021/11/15}{\hook_use:n}

```

(End definition for `\hook_use:n` and others. This function is documented on page 192.)

`__hook_use:wn` `__hook_use:wn` does a quick check to test if the current hook is a file hook: those need a special treatment. If it is not, the hook does not exist. If it is, then `__hook_try_file_hook:n` is called, and checks that the current hook is a file-specific hook using `__hook_if_file_hook:wTF`. If it's not, then it's a generic `file/` hook and is used if it exist.

If it is a file-specific hook, it passes through the same normalization as during declaration, and then it is used if defined. `__hook_if_usable_use:n` checks if the hook exist, and calls `__hook_preamble_hook:n` if so, then uses the hook.

```

1226   <latexrelease>    }
1227 <latexrelease>  }
1228 <latexrelease>\EndIncludeInRelease

(End definition for \__hook_use:wn, \__hook_try_file_hook:n, and \__hook_if_usable_use:n.)

```

\hook_use_once:n For hooks that can and should be used only once we have a special use command that further inhibits the hook from getting more code added to it. This has the effect that any further code added to the hook is executed immediately rather than stored in the hook.

The code needs some gymnastics to prevent space trimming from the hook name, since `\hook_use:n` and `\hook_use_once:n` are documented to not trim spaces.

```

1229 \cs_new_protected:Npn \hook_use_once:n #1
1230  {
1231   \__hook_if_execute_immediately:nF {#1}
1232   { \__hook_normalize_hook_args:Nn \__hook_use_once:n { \use:n {#1} } }
1233 }
1234 \cs_new_protected:Npn \__hook_use_once:n #1
1235  {
1236   \__hook_preamble_hook:n {#1}
1237   \__hook_use_once_set:n {#1}
1238   \__hook_use_initialized:n {#1}
1239   \__hook_use_once_clear:n {#1}
1240 }

```

`__hook_use_once_set:n` is used before the actual hook code is executed so that any usage of `\AddToHook` inside the hook causes the code to execute immediately. Setting `\g__hook_<hook>_reversed_tl` to `I` prevents further code from being added to the hook. `__hook_use_once_clear:n` then clears the hook so that any further call to `\hook_use:n` or `\hook_use_once:n` will expand to nothing.

```

1241 \cs_new_protected:Npn \__hook_use_once_set:n #1
1242  { \__hook_tl_gset:cn { g__hook_#1_reversed_tl } { I } }
1243 \cs_new_protected:Npn \__hook_use_once_clear:n #1
1244  {
1245   \__hook_tl_gclear:c { __hook~#1 }
1246   \__hook_tl_gclear:c { __hook_next~#1 }
1247   \__hook_tl_gclear:c { __hook_toplevel~#1 }
1248   \prop_gclear_new:c { g__hook_#1_code_prop }
1249 }

```

(End definition for `\hook_use_once:n` and others. This function is documented on page 192.)

`__hook_if_execute_immediately_p:n` To check whether the code being added should be executed immediately (that is, if the hook is a one-time hook), we check if it's usable (it can't be one-time if it was not already usable), then we check that `\g__hook_<hook>_reversed_tl` is `I`. The gymnastics around `\if:w` is there to allow the `reversed` token list to be empty.

```
1250 \prg_new_conditional:Npnn \__hook_if_execute_immediately:n #1 { T, F, TF }
```

```

1251   {
1252     \__hook_if_usable:nTF {#1}
1253     {
1254       \exp_after:wN \__hook_clean_to_scan:w
1255       \if:w I \cs:w g__hook_#1_reversed_tl \cs_end:
1256         \s__hook_mark \prg_return_true:
1257       \else:
1258         \s__hook_mark \prg_return_false:
1259       \fi:
1260     }
1261     { \prg_return_false: }
1262   }

```

(End definition for `__hook_if_execute_immediately:nTF`.)

4.10 Querying a hook

Simpler data types, like token lists, have three possible states; they can exist and be empty, exist and be non-empty, and they may not exist, in which case emptiness doesn't apply (though `\tl_if_empty:N` returns false in this case).

Hooks are a bit more complicated: they have several other states as discussed in 4.4.2. A hook may exist or not, and either way it may or may not be empty (even a hook that doesn't exist may be non-empty) or may be disabled.

A hook is said to be empty when no code was added to it, either to its permanent code pool, or to its “next” token list. The hook doesn't need to be declared to have code added to its code pool (it may happen that a package *A* defines a hook `foo`, but it's loaded after package *B*, which adds some code to that hook. In this case it is important that the code added by package *B* is remembered until package *A* is loaded).

All other states can only be queried with internal tests as the different states are irrelevant for package code.

`\hook_if_empty_p:n` Test if a hook is empty (that is, no code was added to that hook). A $\langle\text{hook}\rangle$ being empty means that all three of its `\g__hook_<hook>_code_prop`, its `__hook_toplevel_<hook>` and its `__hook_next_<hook>` are empty.

```

1263 \prg_new_conditional:Npnn \hook_if_empty:n #1 { p , T , F , TF }
1264   {
1265     \__hook_if_structure_exist:nTF {#1}
1266     {
1267       \bool_lazy_and:nnTF
1268       { \prop_if_empty_p:c { g__hook_#1_code_prop } }
1269       {
1270         \bool_lazy_and_p:nn
1271         { \tl_if_empty_p:c { __hook_toplevel~#1 } }
1272         { \tl_if_empty_p:c { __hook_next~#1 } }
1273       }
1274       { \prg_return_true: }
1275       { \prg_return_false: }
1276     }
1277     { \prg_return_true: }
1278   }

```

(End definition for `\hook_if_empty:nTF`. This function is documented on page 193.)

`__hook_if_usable_p:n` A hook is usable if the token list that stores the sorted code for that hook, `__hook_if_usable:nTF` `\hook <hook>`, exists. The property list `\g__hook_<hook>_code_prop` cannot be used here because often it is necessary to add code to a hook without knowing if such hook was already declared, or even if it will ever be (for example, in case the package that defines it isn't loaded).

```
1279 \prg_new_conditional:Npnn \__hook_if_usable:n #1 { p , T , F , TF }
1280 {
1281     \tl_if_exist:cTF { __hook~#1 }
1282     { \prg_return_true: }
1283     { \prg_return_false: }
1284 }
```

(End definition for `__hook_if_usable:nTF`.)

`__hook_if_structure_exist_p:n` An internal check if the hook has already its basic internal structure set up with `__hook_init_structure:n`. This means that the hook was already used somehow (a code chunk or rule was added to it), but it still wasn't declared with `\hook_new:n`.

```
1285 \prg_new_conditional:Npnn \__hook_if_structure_exist:n #1 { p , T , F , TF }
1286 {
1287     \prop_if_exist:cTF { g__hook_#1_code_prop }
1288     { \prg_return_true: }
1289     { \prg_return_false: }
1290 }
```

(End definition for `__hook_if_structure_exist:nTF`.)

`__hook_if_declared_p:n` Internal test to check if the hook was officially declared with `\hook_new:n` or a variant.

`__hook_if_declared:nTF`

```
1291 \prg_new_conditional:Npnn \__hook_if_declared:n #1 { p , T , F , TF }
1292 {
1293     \tl_if_exist:cTF { g__hook_#1_declared_tl }
1294     { \prg_return_true: }
1295     { \prg_return_false: }
1296 }
```

(End definition for `__hook_if_declared:nTF`.)

`__hook_if_reversed_p:n` An internal conditional that checks if a hook is reversed.

`__hook_if_reversed:nTF`

```
1297 \prg_new_conditional:Npnn \__hook_if_reversed:n #1 { p , T , F , TF }
1298 {
1299     \exp_after:wN \__hook_clean_to_scan:w
1300     \if:w - \cs:w g__hook_#1_reversed_tl \cs_end:
1301         \s__hook_mark \prg_return_true:
1302     \else:
1303         \s__hook_mark \prg_return_false:
1304     \fi:
1305 }
```

(End definition for `__hook_if_reversed:nTF`.)

`__hook_if_generic_p:n` An internal conditional that checks if a name belongs to a generic hook. The deprecated version needs to check if #3 is empty to avoid returning true on `file/before`, for example.

`__hook_if_generic:nTF`

```
1306 \prg_new_conditional:Npnn \__hook_if_generic:n #1 { T , TF }
1307     { \__hook_if_generic:w #1 / / \s__hook_mark }
1308     \cs_new:Npn \__hook_if_generic:w #1 / #2 / #3 / #4 \s__hook_mark
```

```

1309  {
1310    \cs_if_exist:cTF { c__hook_generic_#1/.#3_tl }
1311    { \prg_return_true: }
1312    { \prg_return_false: }
1313  }
1314 \prg_new_conditional:Npnn \__hook_if_deprecated_generic:n #1 { T, TF }
1315   { \__hook_if_deprecated_generic:w #1 / / / \s__hook_mark }
1316 \cs_new:Npn \__hook_if_deprecated_generic:w #1 / #2 / #3 / #4 \s__hook_mark
1317  {
1318    \cs_if_exist:cTF { c__hook_deprecated_#1/.#2_tl }
1319    {
1320      \tl_if_empty:nTF {#3}
1321      { \prg_return_false: }
1322      { \prg_return_true: }
1323    }
1324    { \prg_return_false: }
1325  }

```

(End definition for `__hook_if_generic:nTF` and `__hook_if_deprecated_generic:nTF`.)

`__hook_if_generic_reversed_p:n` An internal conditional that checks if a name belongs to a generic reversed hook.

```

\__hook_if_generic_reversed:nTF
1326 \prg_new_conditional:Npnn \__hook_if_generic_reversed:n #1 { T }
1327   { \__hook_if_generic_reversed:w #1 / / / \scan_stop: }
1328 \cs_new:Npn \__hook_if_generic_reversed:w #1 / #2 / #3 / #4 \scan_stop:
1329  {
1330    \if_charcode:w - \cs:w c__hook_generic_#1/.#3_tl \cs_end:
1331    \prg_return_true:
1332  \else:
1333    \prg_return_false:
1334  \fi:
1335  }

```

(End definition for `__hook_if_generic_reversed:nTF`.)

4.11 Messages

Hook errors are LaTeX kernel errors:

```

1336 \prop_gput:Nnn \g_msg_module_type_prop { hooks } { LaTeX }
And so are kernel errors (this should move elsewhere eventually).
1337 \prop_gput:Nnn \g_msg_module_type_prop { latex2e } { LaTeX }
1338 \prop_gput:Nnn \g_msg_module_name_prop { latex2e } { kernel }

1460 ⟨latexrelease⟩
1461 ⟨latexrelease⟩\EndIncludeInRelease
```

\AddToHook

```
1462 \NewDocumentCommand \AddToHook { m o +m }
1463   { \hook_gput_code:nnn {#1} {#2} {#3} }
```

(End definition for `\AddToHook`. This function is documented on page 183.)

\AddToHookNext

```
1464 \NewDocumentCommand \AddToHookNext { m +m }
1465   { \hook_gput_next_code:nn {#1} {#2} }
```

(End definition for `\AddToHookNext`. This function is documented on page 185.)

\ClearHookNext

```
1466 \NewDocumentCommand \ClearHookNext { m }
1467   { \hook_gclear_next_code:n {#1} }
```

(End definition for `\ClearHookNext`. This function is documented on page 185.)

\RemoveFromHook

```
1468 \NewDocumentCommand \RemoveFromHook { m o }
1469   { \hook_gremove_code:nn {#1} {#2} }
```

(End definition for `\RemoveFromHook`. This function is documented on page 184.)

\SetDefaultHookLabel Now define a wrapper that replaces the top of the stack with the argument, and updates **\g__hook_hook_curr_name_tl** accordingly.

\PushDefaultHookLabel

```
1470 \NewDocumentCommand \SetDefaultHookLabel { m }
1471   { \__hook_set_default_hook_label:n {#1} }
1472 %
1473 %   The label is only automatically updated with \cs{@onefilewithoptions}
1474 %   (\cs{usepackage} and \cs{documentclass}), but some packages, like
1475 %   Ti\emph{k}Z, define package-like interfaces, like
1476 %   \cs{usetikzlibrary} that are wrappers around \cs{input}, so they
1477 %   inherit the default label currently in force (usually |top-level|,
1478 %   but it may change if loaded in another package). To provide a
1479 %   package-like behavior also for hooks in these files, we provide
1480 %   high-level access to the default label stack.
1481 %   \begin{macrocode}
1482 \NewDocumentCommand \PushDefaultHookLabel { m }
1483   { \__hook_curr_name_push:n {#1} }
1484 \NewDocumentCommand \PopDefaultHookLabel { }
1485   { \__hook_curr_name_pop: }
```

The current label stack holds the labels for all files but the current one (more or less like **\@currnamestack**), and the current label token list, **\g__hook_hook_curr_name_tl**, holds the label for the current file. However **\@pushfilename** happens before **\@currname** is set, so we need to look ahead to get the **\@currname** for the label. **\expl3** also requires the current file in **\@pushfilename**, so here we abuse **\@expl@push@filename@aux@@** to do **__hook_curr_name_push:n**.

```
1486 \cs_gset_protected:Npn \@expl@push@filename@aux@@ #1#2#3
1487   {
1488     \__hook_curr_name_push:n {#3}
1489     \str_gset:Nx \g_file_curr_name_str {#3}
1490     #1 #2 {#3}
1491   }
```

(End definition for **\SetDefaultHookLabel**, **\PushDefaultHookLabel**, and **\PopDefaultHookLabel**. These functions are documented on page 187.)

\UseHook Avoid the overhead of **xparse** and its protection that we don't want here (since the hook should vanish without trace if empty)!

```
1492 \cs_new:Npn \UseHook      { \hook_use:n }
1493 \cs_new:Npn \UseOneTimeHook { \hook_use_once:n }
```

(End definition for **\UseHook** and **\UseOneTimeHook**. These functions are documented on page 182.)

\ShowHook

\LogHook

```
1494 \cs_new_protected:Npn \ShowHook { \hook_show:n }
1495 \cs_new_protected:Npn \LogHook { \hook_log:n }
```

(End definition for **\ShowHook** and **\LogHook**. These functions are documented on page 190.)

\DebugHooksOn

\DebugHooksOff

```
1496 \cs_new_protected:Npn \DebugHooksOn { \hook_debug_on: }
1497 \cs_new_protected:Npn \DebugHooksOff { \hook_debug_off: }
```

(End definition for **\DebugHooksOn** and **\DebugHooksOff**. These functions are documented on page 191.)

```
\DeclareHookRule
1498 \NewDocumentCommand \DeclareHookRule { m m m m }
1499   { \hook_gset_rule:nnnn {#1}{#2}{#3}{#4} }

(End definition for \DeclareHookRule. This function is documented on page 188.)
```

\DeclareDefaultHookRule This declaration is only supported before \begin{document}.

```
1500 \NewDocumentCommand \DeclareDefaultHookRule { m m m }
1501   { \hook_gset_rule:nnnn {??}{#1}{#2}{#3} }
1502 \onlyinpreamble\DeclareDefaultHookRule
```

(End definition for \DeclareDefaultHookRule. This function is documented on page 189.)

\ClearHookRule A special setup rule that removes an existing relation. Basically @@_rule_gclear:nnn plus fixing the property list for debugging.

FMi: Needs perhaps an L3 interface, or maybe it should get dropped?

```
1503 \NewDocumentCommand \ClearHookRule { m m m }
1504   { \hook_gset_rule:nnnn {#1}{#2}{unrelated}{#3} }
```

(End definition for \ClearHookRule. This function is documented on page 189.)

\IfHookEmptyTF Here we avoid the overhead of xparses, since \IfHookEmptyTF is used in \end (that is, every L^AT_EX environment). As a further optimization, use \let rather than \def to avoid one expansion step.

```
1505 \cs_new_eq:NN \IfHookEmptyTF \hook_if_empty:nTF
```

(End definition for \IfHookEmptyTF. This function is documented on page 189.)

\IfHookExistsTF Marked for removal and no longer documented in the doc section!

PhO: \IfHookExistsTF is used in jlreq.cls, pxatbegshi.sty, pxeverysel.sty, pxeveryshi.sty, so the public name may be an alias of the internal conditional for a while. Regardless, those packages' use for \IfHookExistsTF is not really correct and can be changed.

```
1506 \cs_new_eq:NN \IfHookExistsTF \__hook_if_usable:nTF
```

(End definition for \IfHookExistsTF.)

4.13 Deprecated that needs cleanup at some point

\ProvideMirroredHookPair	<code>\cs_new_protected:Npn \ProvideMirroredHookPair</code>
	<code>{</code>
	<code> __hook_DEPRECATED_WARN:nn</code>
	<code> { ProvideMirroredHookPair }</code>
	<code> { ActivateGenericHook }</code>
	<code> __hook_activate_generic_pair:nn</code>
	<code>}</code>

(End definition for \DisableHook and others.)

`__hook_DEPRECATED_WARN:nn` Warns about a deprecation, telling what should be used instead.

```

1567 \cs_new_protected:Npn \__hook_deprecated_warn:nn #1 #2
1568   { \msg_warning:nnnn { hooks } { deprecated } {#1} {#2} }
1569 \msg_new:nnn { hooks } { deprecated }
1570   {
1571     Command~\iow_char:N\#1~is~deprecated~and~will~be~removed~in~a~
1572     future~release. \\ \\
1573     Use~\iow_char:N\#2~instead.
1574   }

```

(End definition for `__hook_deprecated_warn:nn`.)

4.14 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L^AT_EX 2 _{ε} names to allow for internal commands to be used outside this module. We have to unset the `@@` since we want double “at” sign in place of double underscores.

```
1575 <@@=>
```

```
\@expl@@@initialize@all@@
```

```

1576 \cs_new_eq:NN \@expl@@@initialize@all@@
1577   \__hook_initialize_all:
1578 \cs_new_eq:NN \@expl@@@hook@curr@name@pop@@
1579   \__hook_curr_name_pop:

```

(End definition for `\@expl@@@initialize@all@@` and `\@expl@@@hook@curr@name@pop@@`.)

Rolling back here doesn’t undefine the interface commands as they may be used in packages without rollback functionality. So we just make them do nothing which may or may not work depending on the code usage.

```

File i

ltcmdhooks.dtx

1 Introduction

This file implements generic hooks for (arbitrary) commands. In theory every command `\langle name \rangle` offers now two associated hooks to which code can be added using `\AddToHook` or `\AddToHookNext`.¹¹ These are

`cmd/\langle name \rangle/before` This hook is executed at the very start of the command execution after its arguments (if any) are parsed. The hook `\langle code \rangle` is wrapped in the command inside a call to `\UseHook{cmd/\langle name \rangle/before}`, so the arguments passed to the command are *not* available in the hook `\langle code \rangle`.

`cmd/\langle name \rangle/after` This hook is similar to `cmd/\langle name \rangle/before`, but it is executed at the very end of the command body. This hook is implemented as a reversed hook.

The hooks are not physically present before `\begin{document}` (i.e., using a command in the preamble will never execute them) and if nobody has declared any code for them, then they are not added to the command code ever. For example, if we have the following definition

```
\newcommand\foo[2]{Code #1 for #2!}
```

then executing `\foo{A}{B}` will simply run `Code_A_for_B!` as it was always the case. However, if somebody, somewhere (e.g., in a package) adds

```
\AddToHook{cmd/foo/before}{<before code>}
```

then, after `\begin{document}` the definition of `\foo` will be:

```
\renewcommand\foo[2]{\UseHook{cmd/foo/before}Code #1 for #2!}
```

and similarly `\AddToHook{cmd/foo/after}{<after code>}` alters the definition to

```
\renewcommand\foo[2]{Code #1 for #2!\UseHook{cmd/foo/after}}
```

In other words, the mechanism is similar to what etoolbox offers with `\preto` and `\appto` with the important differences

- that code can be prepended or appended (i.e., added to the hooks) even if the command itself is not defined, because the defining package has not yet been loaded
- and that by using the hook management interface it is now possible to define how the code chunks added in these places are ordered, if different packages want to add code at these points.

2 Restrictions and Operational details

Adding arbitrary material to commands is tricky because most of the time we do not know what the macro expects as arguments when expanding and TeX doesn't have a reliable way to see that, so some guesswork has to be employed.

¹¹In practice this is not supported for all types of commands, see section 2.2 for the restrictions that apply and what happens if one tries to use this with commands for which this is not supported.

2.1 Patching

The code here tries to find out if a command was defined with `\newcommand` or `\DeclareRobustCommand` or `\NewDocumentCommand`, and if so it *assumes* that the argument specification of the command is as expected (which is not fail-proof, if someone redefines the internals of these commands in devious ways, but is a reasonable assumption).

If the command is one of the defined types, the code here does a sandboxed expansion of the command such that it can be redefined again exactly as before, but with the hook code added.

If however the command is not a known type (it was defined with `\def`, for example), then the code uses an approach similar to `etoolbox`'s `\patchcmd` to retokenize the command with the hook code in place. This procedure, however, is more likely to fail if the catcode settings are not the same as the ones at the time of command's definition, so not always adding a hook to a command will work.

2.1.1 Timing

When `\AddToHook` (or its `expl3` equivalent) is called with a generic `cmd` hook, say, `cmd/foo/before`, for the first time (that is, no code was added to that same hook before), in the preamble of a document, it will store a patch instruction for that command until `\begin{document}`, and only then all the commands which had hooks added will be patched in one go. That means that no command in the preamble will have hooks patched into them.

At `\begin{document}` all the delayed patches will be executed, and if the command doesn't exist the code is still added to the hook, but it will not be executed. After `\begin{document}`, when `\AddToHook` is called with a generic `cmd` hook the first time, the command will be immediately patched to include the hook, and if it doesn't exist or if it can't be patched for any reason, an error is thrown; if `\AddToHook` was already used in the preamble no new patching is attempted.

This has the consequence that a command defined or redefined after `\begin{document}` only uses generic `cmd` hook code if `\AddToHook` is called for the first time after the definition is made, or if the command explicitly uses the generic hook in its definition by declaring it with `\NewHookPair` adding `\UseHook` as part of the code.¹²

2.2 Commands that look ahead

Some commands are defined in different “steps” and they look ahead in the input stream to find more arguments. If you try to add some code to the `cmd/(name)/after` hook of such command, it will not work, and it is not possible to detect that programmatically, so the user has to know (or find out) which commands can or cannot have hooks attached to them.

One good example is the `\section` command. You can add something to the `cmd/section/before` hook, but if you try to add something to the `cmd/section/after` hook, `\section` will no longer work. That happens because the `\section` macro takes no argument, but instead calls a few internal L^AT_EX macros to look for the optional and mandatory arguments. By adding code to the `cmd/section/after` hook, you get in the way of that scanning.

¹²We might change this behavior in the main document slightly after gaining some usage experience.

3 Package Author Interface

The `cmd` hooks are, by default, available for all commands that can be patched to add the hooks. For some commands, however, the very beginning or the very end of the code is not the best place to put the hooks, for example, if the command looks ahead for arguments (see section 2.2).

If you are a package author and you want to add the hooks to your own commands in the proper position you can define the command and manually add the `\UseHook` calls inside the command in the proper positions, and manually define the hooks with `\NewHook` or `\NewReversedHook`. When the hooks are explicitly defined, patching is not attempted so you can make sure your command works properly. For example, an (admittedly not really useful) command that typesets its contents in a framed box with width optionally given in parentheses:

```
\newcommand\fancybox{\@ifnextchar({\@fancybox}{\@fancybox(5cm)}}
\def\@fancybox(#1)#2{\fbox{\parbox{#1}{#2}}}
```

If you try that definition, then add some code after it with

```
\AddToHook{cmd/fancybox/after}{<code>}
```

and then use the `\fancybox` command you will see that it will be completely broken, because the hook will get executed in the middle of parsing for optional (...) argument.

If, on the other hand, you want to add hooks to your command you can do something like:

```
\newcommand\fancybox{\@ifnextchar({\@fancybox}{\@fancybox(5cm)}}
\def\@fancybox(#1)#2{\fbox{%
\UseHook{cmd/fancybox/before}%
\parbox{#1}{#2}%
\UseHook{cmd/fancybox/after}}}
\NewHook{cmd/fancybox/before}
\NewReversedHook{cmd/fancybox/after}
```

then the hooks will be executed where they should and no patching will be attempted. It is important that the hooks are declared with `\NewHook` or `\NewReversedHook`, otherwise the command hook code will try to patch the command. Note also that the call to `\UseHook{cmd/fancybox/before}` does not need to be in the definition of `\fancybox`, but anywhere it makes sense to insert it (in this case in the internal `\@fancybox`).

Alternatively, if for whatever reason your command does not support the generic hooks provided here, you can disable a hook with `\DisableHook`¹³, so that when someone tries to add code to it they will get an error. Or if you don't want the error, you can simply declare the hook with `\NewHook` and never use it.

The above approach is useful for really complex commands where for one or the other reason the hooks can't be placed at the very beginning and end of the command body and some hand-crafting is needed. However, in the example above the real (and in fact only) issue is the cascading argument parsing in the style developed long ago in L^AT_EX 2.09. Thus, a much simpler solution for this case is to replace it with the modern `\NewDocumentCommand` syntax and define the command as follows:

```
\DeclareDocumentCommand\fancybox{D(){5cm}m}{\fbox{\parbox{#1}{#2}}}
```

If you do that then both hooks automatically work and are patched into the right places.

¹³Please use `\DisableHook` if at all, only on hooks that you "own", i.e., for commands that your package or class defines and not second guess whether or not hooks of other packages should get disabled!

4 The Implementation

4.1 Execution plan

To add `before` and `after` hooks to a command we will need to peek into the definition of a command, which is always a tricky thing to do. Some cases are easy because we know how the command was defined, so we can assume how its *<parameter text>* looks like (for example a command defined with `\newcommand` may have an optional argument followed by a run of mandatory arguments), so we can just expand that command and make it grab #1, #2, etc. as arguments and define it all back with the hooks added.

Life's usually not that easy, so with some commands we can't do that (a #1 might as well be #₁₂1₁₂ instead of the expected #₆1₁₂, for example) so we need to resort to "patching" the command: read its `\meaning`, and tokenize it again with `\scantokens` and hope for the best.

So the overall plan is:

1. Check if a command is of a known type (that is, defined with `\newcommand`¹⁴, `\DeclareRobustCommand`, or `\New(Expandable)DocumentCommand`), and if is, take appropriate action.
2. If the command is not a known type, we'll check if the command can be patched. Two things will prevent a command from being patched: if it was defined in a nonstandard catcode setting, or if it is an internal expl3 command with `__<module>` in its name, in which case we refuse to patch.
3. If the command was defined in nonstandard catcode settings, we will try a few standard ones to try our best to carry out the patching. If this doesn't help either, the code will give up and throw an error.

```
1  {@@=hook}
2  {*2ekernel | latexrelease}
3  \ExplSyntaxOn
4  {latexrelease}\NewModuleRelease{2021/06/01}{ltcmdhooks}
5  {latexrelease}                                {The~hook~management~system~for~commands}
```

4.2 Variables

`\g_hook_patch_action_list_tl` Pairs of `\if<cmd>..\patch<cmd>` to be used with `\robust@command@act` when looking for a known patching rule. This token list is exposed because we see some future applications (with very specialized packages, such as `etoolbox` that may want to extend the pairs processed. It is not meant for general use which is why it is not documented in the interface documentation above.

```
6  \tl_new:N \g_hook_patch_action_list_tl
(End definition for \g_hook_patch_action_list_tl.)
```

`\l__hook_patch_num_args_int` The number of arguments in a macro being patched.

```
7  \int_new:N \l__hook_patch_num_args_int
(End definition for \l__hook_patch_num_args_int.)
```

¹⁴It's not always possible to reliably detect this case because a command defined with no optional argument is indistinguishable from a `\defed` command.

\l__hook_patch_prefixes_t1	The prefixes and parameters of the definition for the macro being patched.
\l__hook_param_text_t1	⁸ \tl_new:N \l__hook_patch_prefixes_t1
\l__hook_replace_text_t1	⁹ \tl_new:N \l__hook_param_text_t1 ¹⁰ \tl_new:N \l__hook_replace_text_t1
	(End definition for \l__hook_patch_prefixes_t1, \l__hook_param_text_t1, and \l__hook_replace_text_t1.)
\c__hook_hash_t1	A constant token list that contains two parameter tokens.
	¹¹ \tl_const:Nn \c__hook_hash_t1 { # # }
	(End definition for \c__hook_hash_t1.)
__hook_exp_not:NN	Two temporary macros that change depending on the macro being patched.
__hook_def_cmd:w	¹² \cs_new_eq:NN __hook_exp_not:NN ? ¹³ \cs_new_eq:NN __hook_def_cmd:w ?
	(End definition for __hook_exp_not:NN and __hook_def_cmd:w.)
\q__hook_recursion_tail	Internal quarks for recursion: they can't appear in any macro being patched.
\q__hook_recursion_stop	¹⁴ \quark_new:N \q__hook_recursion_tail ¹⁵ \quark_new:N \q__hook_recursion_stop
	(End definition for \q__hook_recursion_tail and \q__hook_recursion_stop.)
\g__hook_delayed_patches_prop	A list containing the patches delayed to \begin{document}, so that patching is not attempted twice.
	¹⁶ \prop_new:N \g__hook_delayed_patches_prop
	(End definition for \g__hook_delayed_patches_prop.)
__hook_patch_debug:x	A helper for patching debug info.
	¹⁷ \cs_new_protected:Npn __hook_patch_debug:x #1 ¹⁸ { __hook_debug:n { \iow_term:x { [lthooks]~#1 } } }
	(End definition for __hook_patch_debug:x.)
4.3 Variants	
\tl_rescan:nV	\exp3 function variants used throughout the code.
	¹⁹ \cs_generate_variant:Nn \tl_rescan:nn { nV }
	(End definition for \tl_rescan:nV.)

4.4 Patching or delaying

Before `\begin{document}` all patching is delayed.

```
\_\_hook\_try\_put\_cmd\_hook:n  
\_\_hook\_try\_put\_cmd\_hook:w
```

This function is called from within `\AddToHook`, when code is first added to a generic cmd hook. If it is called within in the preamble, it delays the action until `\begin{document}`; otherwise it tries to update the hook.

```
20 <|latexrelease>\IncludeInRelease{2021/11/15}{\_\_hook\_try\_put\_cmd\_hook:n}%
21 <|latexrelease>                                {Standardise-generic-hook-names}
22 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:n #1
23   { \_\_hook_try_put_cmd_hook:w #1 / / \s__hook_mark {#1} }
24 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:w
25   #1 / #2 / #3 / #4 \s__hook_mark #5
26   {
27     \_\_hook_debug:n { \iow_term:n { ->~Adding~cmd~hook~to~'#2'~(#3): } }
28     \exp_args:Nc \_\_hook_patch_cmd_or_delay:Nnn {#2} {#3}
29   }
30 <|latexrelease>\EndIncludeInRelease
31 <|latexrelease>\IncludeInRelease{2021/06/01}{\_\_hook_try_put_cmd_hook:n}%
32 <|latexrelease>                                {Standardise-generic-hook-names}
33 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:n #1
34 { \_\_hook_try_put_cmd_hook:w #1 / / \s__hook_mark {#1} }
35 \cs_new_protected:Npn \_\_hook_try_put_cmd_hook:w
36 #1 / #2 / #3 / #4 \s__hook_mark #5
37 <|latexrelease>  {
38   \_\_hook_debug:n { \iow_term:n { ->~Adding~cmd~hook~to~'#2'~(#3): } }
39   \str_case:nnTF {#3}
40     { { before } { } { after } { } }
41     { \exp_args:Nc \_\_hook_patch_cmd_or_delay:Nnn {#2} {#3} }
42     { \msg_error:nnnn { hooks } { wrong-cmd-hook } {#2} {#3} }
43   <|latexrelease>
44 <|latexrelease>\EndIncludeInRelease
```

(End definition for `__hook_try_put_cmd_hook:n` and `__hook_try_put_cmd_hook:w`.)

```
\_\_hook_patch_cmd_or_delay:Nnn  
\_\_hook_cmd_begindocument_code:
```

In the preamble, `__hook_patch_cmd_or_delay:Nnn` just adds the patch instruction to a property list to be executed later.

```
45 \cs_new_protected:Npn \_\_hook_patch_cmd_or_delay:Nnn #1 #2 #3
46   {
47     \_\_hook_debug:n { \iow_term:n { ->~Add-generic-cmd-hook-for~#2~(#3). } }
48     \_\_hook_debug:n
49       { \iow_term:n { !~In~the~preamble:~delaying. } }
50     \prop_gput:Nnn \g__hook_delayed_patches_prop { #2 / #3 }
51     { \_\_hook_cmd_try_patch:nn {#2} {#3} }
52 }
```

The delayed patches are added to a property list to prevent duplication, and the code stored in the property list for each key is executed. The function `__hook_patch_cmd_or_delay:Nnn` is also redefined to be `__hook_patch_command:Nnn` so that no further delaying is attempted.

```
53 \cs_new_protected:Npn \_\_hook_cmd_begindocument_code:
54   {
55     \cs_gset_eq:NN \_\_hook_patch_cmd_or_delay:Nnn \_\_hook_patch_command:Nnn
56     \prop_map_function:NN \g__hook_delayed_patches_prop { \use_i:nn }
```

```

57      \prop_gclear:N \g__hook_delayed_patches_prop
58      \cs_undefine:N \__hook_cmd_begindocument_code:
59    }
60 \g@addto@macro \o@kernel@after@begindocument
61 { \__hook_cmd_begindocument_code: }

(End definition for \__hook_patch_cmd_or_delay:Nnn and \__hook_cmd_begindocument_code::)

```

__hook_cmd_try_patch:n At `\begin{document}` tries patching the command if the hook was not manually created in the meantime. If the document does not exist, no error is raised here as it may hook into a package that wasn't loaded. Hooks added to commands in the document body still raise an error if the command is not defined.

```

62 \cs_new_protected:Npn \__hook_cmd_try_patch:n #1 #2
63 {
64   \__hook_debug:n
65   { \iow_term:x { ->~\string\begin{document}~try~cmd / #1 / #2. } }
66   \__hook_if_declared:nTF { cmd / #1 / #2 }
67   {
68     \__hook_debug:n
69     { \iow_term:n { .->~Giving~up:~hook~already~created. } }
70   }
71   {
72     \cs_if_exist:cT {#1}
73     { \exp_args:Nc \__hook_patch_command:Nnn {#1} {#1} {#2} }
74   }
75 }

(End definition for \__hook_cmd_try_patch:n.)

```

4.5 Patching commands

__hook_patch_command:Nnn will do some sanity checks on the argument to detect if it is possible to add hooks to the command, and raises an error otherwise. If the command can contain hooks, then it uses `\robust@command@act` to find out what type is the command, and patch it accordingly.

```

76 \cs_new_protected:Npn \__hook_patch_command:Nnn #1 #2 #3
77 {
78   \__hook_patch_debug:x { analyzing~'\token_to_str:N #1' }
79   \__hook_patch_debug:x { \token_to_str:N #1 = \token_to_meaning:N #1 }
80   \__hook_patch_check>NNnn \cs_if_exist:NTF #1 { undef }
81   {
82     \__hook_patch_debug:x { ++control~sequence~is~defined }
83     \__hook_patch_check>NNnn \token_if_macro:NTF #1 { macro }
84     {
85       \__hook_patch_debug:x { ++control~sequence~is~a~macro }
86       \__hook_patch_check>NNnn \__hook_if_public_command:NTF #1 { expl3 }
87       {
88         \__hook_patch_debug:x { ++macro~is~not~private }
89         \robust@command@act
90         \g_hook_patch_action_list_tl #1
91         \__hook_retokenize_patch:Nnn { #1 {#2} {#3} }
92       }
93     }
94 }

File i: ltcmdhooks.dtx

```

```
95 }
```

And here's the auxiliary used above:

```
96 \cs_new_protected:Npn \_hook_patch_check:NNnn #1 #2 #3 #4
97 {
98     #1 #2 {#4}
99     {
100         \msg_error:nxxx { hooks } { cant-patch }
101         { \token_to_str:N #2 } {#3}
102     }
103 }
```

and a conditional `_hook_if_public_command:N` to check if a command has `_` in its name (no other checking is performed). Primitives with `:D` in their name could be included here, but they are already discarded in the `\token_if_macro:NTF` test above.

```
104 \use:x
105 {
106     \prg_new_protected_conditional:Npnn
107         \exp_not:N \_hook_if_public_command:N ##1 { TF }
108     {
109         \exp_not:N \exp_last_unbraced:Nf
110         \exp_not:N \_hook_if_public_command:w
111         { \exp_not:N \cs_to_str:N ##1 }
112         \tl_to_str:n { _ } \s__hook_mark
113     }
114 }
115 \exp_last_unbraced:NNNNo
116 \cs_new_protected:Npn \_hook_if_public_command:w
117     #1 \tl_to_str:n { _ } #2 \s__hook_mark
118 {
119     \tl_if_empty:nTF {#2}
120     { \prg_return_true: }
121     { \prg_return_false: }
122 }
```

(End definition for `_hook_patch_command:Nnn` and others.)

4.5.1 Patching by expansion and redefinition

`\g_hook_patch_action_list_tl` This is the list of known command types and the function that patches the command hooks into them. The conditionals are taken from `\ShowCommand`, `\NewCommandCopy` and `_kernel_cmd_if_xparse:NTF` defined in `ltcmd`.

```
123 \tl_gset:Nn \g_hook_patch_action_list_tl
124 {
125     { \c@if@DeclareRobustCommand \_hook_patch_DeclareRobustCommand:Nnn }
126     { \c@if@newcommand \_hook_patch_newcommand:Nnn }
127     { \_kernel_cmd_if_xparse:NTF \_hook_cmd_patch_xparse:Nnn }
128 }
```

(End definition for `\g_hook_patch_action_list_tl`.)

`_hook_patch_DeclareRobustCommand:Nnn` At this point we know that the commands can be patched by expanding then redefining. These are the cases of commands defined with `\newcommand` with an optional argument or with `\DeclareRobustCommand`.

With `__hook_patch_DeclareRobustCommand:Nnn` we check if the command has an optional argument (with a test counter-intuitively called `\@if@newcommand`; also make sure the command doesn't take args by calling `\robust@command@chk@safe`). If so, we pass the patching action to `__hook_patch_newcommand:Nnn`, otherwise we call the patching engine `__hook_patch_expand_redefine:NNnn` with a `\c_false_bool` to indicate that there is no optional argument.

```

129 \cs_new_protected:Npn \_\_hook_patch_DeclareRobustCommand:Nnn #1
130   {
131     \exp_args:Nc \_\_hook_patch_DeclareRobustCommand_aux:Nnn
132     { \cs_to_str:N #1 ~ }
133   }
134 \cs_new_protected:Npn \_\_hook_patch_DeclareRobustCommand_aux:Nnn #1
135   {
136     \robust@command@chk@safe #1
137     { \@if@newcommand #1 }
138     { \use_i:nn }
139     { \_\_hook_patch_newcommand:Nnn }
140     { \_\_hook_patch_expand_redefine:NNnn \c_false_bool }
141     #1
142   }

```

(End definition for `__hook_patch_DeclareRobustCommand:Nnn`.)

`__hook_patch_newcommand:Nnn` If the command was defined with `\newcommand` and an optional argument, call the patching engine with a `\c_true_bool` to flag the presence of an optional argument, and with `\\command` to patch the actual code for `\command`.

```

143 \cs_new_protected:Npn \_\_hook_patch_newcommand:Nnn #1
144   {
145     \exp_args:NNc \_\_hook_patch_expand_redefine:NNnn \c_true_bool
146     { \c_backslash_str \cs_to_str:N #1 }
147   }

```

(End definition for `__hook_patch_newcommand:Nnn`.)

`__hook_cmd_patch_xparse:Nnn` And for commands defined by the `xparse` commands use this for patching:

```

148 \cs_new_protected:Npn \_\_hook_cmd_patch_xparse:Nnn #1
149   {
150     \exp_args:NNc \_\_hook_patch_expand_redefine:NNnn \c_false_bool
151     { \cs_to_str:N #1 ~ code }
152   }

```

(End definition for `__hook_cmd_patch_xparse:Nnn`.)

`__hook_patch_expand_redefine:NNnn` Now the real action begins. Here we have in `#1` a boolean indicating if the command has a leading [...] -delimited argument, in `#2` the command control sequence, in `#3` the name of the command (note that `#1 ≠ \csname#2\endcsname` at this point!), and in `#4` the hook position, either `before` or `after`.

Patching with expansion+redefinition is trickier than it looks like at first glance. Suppose the simple definition:

```
\def\foo#1{#1##2}
```

When defined, its `\langle replacement text \rangle` will be a token list containing:

out_param 1, mac_param #, character 2

Then, after expanding `\foo{##1}` (here `##` denotes a single `#6`) we end up with a token list with *out_param 1* replaced:

mac_param #, character 1, mac_param #, character 2

that is, the definition would be:

```
\def\foo#1{#1#2}
```

which obviously fails, because the original input in the definition was `##` but TeX reduced that to a single parameter token `#6` when carrying out the definition. That leaves no room for a clever solution with (say) `\unexpanded`, because anything that would double the second `#6`, would also (incorrectly) double the first, so there's not much to do other than a manual solution.

There are three cases we can distinguish to make things hopefully faster on simpler cases:

1. a macro with no parameters;
2. a macro with no parameter tokens in its definition;
3. a macro with parameters *and* parameter tokens.

The first case is trivial: if the macro has no parameters, we can just use `\unexpanded` around it, and if there is a parameter token in it, it is handled correctly (the macro can be treated as a `tl` variable).

The second case requires looking at the *(replacement text)* of the macro to see if it has a parameter token in there. If it does not, then there is no worry, and the macro can be redefined normally (without `\unexpanded`).

The third case, as usual, is the devious one. Here we'll have to loop through the definition token by token, and double every parameter token, so that this case can be handled like the previous one.

```
153 \cs_new_protected:Npn \__hook_patch_expand redefine:NNnn #1 #2 #3 #4
154   {
155     \__hook_patch_debug:x { ++~command~can~be~patched~without~rescanning }
```

We'll start by counting the number of arguments in the command by counting the number of characters in the `\cs_argument_spec:N` of the macro, divided by two, and subtracting one if the command has an optional argument (that is, an extra `[]` in its *(parameter text)*).

```
156   \int_set:Nn \l__hook_patch_num_args_int
157   {
158     \exp_args:Nf \str_count:n { \cs_argument_spec:N #2 } / 2
159     \bool_if:NT #1 { -1 }
160   }
```

Now build two token lists:

`\l__hook_param_text_tl` will contain the *(parameter text)* to be used when redefining the macro. It should be identical to the *(parameter text)* used when originally defining that macro.

`\l__hook_replace_text_tl` will contain braced pairs of `\c_hook_hash_tl<num>` to feed to the macro when expanded. This token list as well as the previous will have the first item surrounded by `[...]` in the case of an optional argument.

The use of `\c__hook_hash_tl` here is to differentiate actual parameters in the macro from parameter tokens in the original definition of the macro. Later on, `\c__hook_hash_tl` is either replaced by actual parameter tokens, or expanded into them.

```
161     \int_compare:nNnTF { \l__hook_patch_num_args_int } > { \c_zero_int }
162     {

```

We'll first check if the command has any parameter token in its definition (feeding it empty arguments), and set `_hook_exp_not:n` accordingly. `_hook_exp_not:n` will be used later to either leave `\c__hook_hash_tl` or expand it, and also to remember the result of `_hook_if_has_hash:nTF` to avoid testing twice (the test can be rather slow).

```
163     \tl_set:Nx \l__hook_tmpa_tl { \bool_if:NTF #1 { [ ] } { { } } }
164     \int_step_inline:nnn { 2 } { \l__hook_patch_num_args_int }
165     { \tl_put_right:Nn \l__hook_tmpa_tl { { } } }
166     \exp_args:NNo \exp_args:No \_hook_if_has_hash:nTF
167     { \exp_after:wN #2 \l__hook_tmpa_tl }
168     { \cs_set_eq:NN \_hook_exp_not:n \exp_not:n }
169     { \cs_set_eq:NN \_hook_exp_not:n \use:n }
170     \cs_set_protected:Npn \_hook_tmp:w ##1 ##2
171     {
172     ##1 \l__hook_param_text_tl { \use:n ##2 }
173     ##1 \l__hook_replace_text_tl { \_hook_exp_not:n {##2} }
174   }
```

Here we'll conditionally add [...] around the first parameter:

```
175     \bool_if:NTF #1
176     { \_hook_tmp:w \tl_set:Nx { [ \c__hook_hash_tl 1 ] } }
177     { \_hook_tmp:w \tl_set:Nx { { \c__hook_hash_tl 1 } } }
```

Then, for every parameter from the second, just add it normally:

```
178     \int_step_inline:nnn { 2 } { \l__hook_patch_num_args_int }
179     { \_hook_tmp:w \tl_put_right:Nx { { \c__hook_hash_tl ##1 } } }
```

Now, if the command has any parameter token in its definition (then `_hook_exp_not:n` is `\exp_not:n`), call `_hook_double_hashes:n` to double them, and replace every `\c__hook_hash_tl` by #:

```
180     \tl_set:Nx \l__hook_replace_text_tl
181     { \exp_not:N #2 \exp_not:V \l__hook_replace_text_tl }
182     \tl_set:Nx \l__hook_replace_text_tl
183     {
184     \token_if_eq_meaning:NNTF \_hook_exp_not:n \exp_not:n
185     { \exp_args:NNV \exp_args:No \_hook_double_hashes:n }
186     { \exp_args:NV \exp_not:o }
187     \l__hook_replace_text_tl
188   }
```

And now, set a few auxiliaries for the case that the macro has parameters, so it won't be passed through `\unexpanded` (twice):

```
189     \cs_set_eq:NN \_hook_def_cmd:w \tex_gdef:D
190     \cs_set_eq:NN \_hook_exp_not:NN \prg_do_nothing:
191   }
192   {
```

In the case the macro has no parameters, we'll treat it as a token list and things are much simpler (expansion control looks a bit complicated, but it's just a pair of `\exp_not:N` preventing another `\exp_not:n` from expanding):

```

193      \tl_clear:N \l__hook_param_text_tl
194      \tl_set_eq:NN \l__hook_replace_text_tl #2
195      \cs_set_eq:NN \__hook_def_cmd:w \tex_xdef:D
196      \cs_set:Npn \__hook_exp_not:NN ##1 { \exp_not:N ##1 \exp_not:N }
197  }

```

Before redefining, we need to also get the prefixes used when defining the command. Here we ensure that the `\escapechar` is printable, otherwise a macro defined with prefixes `\protected \long` will have it `\meaning` printed as `protectedlong`, making life unnecessarily complicated. Here the `\escapechar` is changed to `/`, then we loop between pairs of `/.../` extracting the prefixes.

```

198  \group_begin:
199  \int_set:Nn \tex_escapechar:D { '/' }
200  \use:x
201  {
202  \group_end:
203  \tl_set:Nx \exp_not:N \l__hook_patch_prefixes_tl
204  { \exp_not:N \__hook_make_prefixes:w \cs_prefix_spec:N #2 / / }
205  }

```

Finally, call `__hook_redefine_with_hooks:Nnnn` with the macro being redefined in #1, then `\UseHook{cmd/<name>/before}` in #2 or `\UseHook{cmd/<name>/after}` in #3 (one is always empty), and in #4 the *<replacement text>* of the macro.

```

206  \use:x
207  {
208  \__hook_redefine_with_hooks:Nnnn \exp_not:N #2
209  \str_if_eq:nnTF {#4} { after }
210  { \use_i:nn }
211  { \use:nn }
212  { { \__hook_exp_not:NN \exp_not:N \UseHook { cmd / #3 / #4 } } }
213  { { } }
214  { \__hook_exp_not:NN \exp_not:V \l__hook_replace_text_tl }
215  }
216  }

```

Now that all the needed tools are ready, without further ado we'll redefine the command. The definition uses the prefixes gathered in `\l__hook_patch_prefixes_tl`, a primitive `__hook_def_cmd:w` (which is `\tex_gdef:D` or `\tex_xdef:D`) to avoid adding extra prefixes, and the *<parameter text>* from `\l__hook_param_text_tl`.

Then finally, in the body of the definition, we insert #2, which is `cmd/#1/before` or empty, #4 which is the *<replacement text>*, and #3 which is `cmd/#1/after` or empty.

```

217 \cs_new_protected:Npn \__hook_redefine_with_hooks:Nnnn #1 #2 #3 #4
218  {
219  \l__hook_patch_prefixes_tl
220  \exp_after:wN \__hook_def_cmd:w
221  \exp_after:wN #1 \l__hook_param_text_tl
222  { #2 #4 #3 }
223  }

```

Here's the auxiliary that makes the prefix control sequences for the redefinition. Each item has to be `\tl_trim_spaces:n'd` because the last item (and not any other) has a trailing space.

```

224 \cs_new:Npn \__hook_make_prefixes:w / #1 /
225  {

```

```

226     \tl_if_empty:nF {#1}
227     {
228         \exp_not:c { tex_ \tl_trim_spaces:n {#1} :D }
229         \__hook_make_prefixes:w /
230     }
231 }

(End definition for \__hook_patch_expand_redefine:Nnnn, \__hook redefine_with_hooks:Nnnn, and
\__hook_make_prefixes:w.)

```

Here are some auxiliaries for the contraption above.

```

\__hook_if_has_hash_p:n \__hook_if_has_hash:nTF searches the token list #1 for a catcode 6 token, and if any is
\__hook_if_has_hash:nTF found, it returns true, and false otherwise. The searching doesn't care about preserving
\__hook_if_has_hash:w groups or spaces: we can ignore those safely (braces are removed) so that searching is as
\__hook_if_has_hash_check:w fast as possible.

```

```

232 \prg_new_conditional:Npnn \__hook_if_has_hash:n #1 { TF }
233   { \__hook_if_has_hash:w #1 ## \s__hook_mark }
234 \cs_new:Npn \__hook_if_has_hash:w #1
235   {
236     \tl_if_single_token:nTF {#1}
237     {
238       \token_if_eq_catcode:NNTF ## #1
239       { \__hook_if_has_hash_check:w }
240       { \__hook_if_has_hash:w }
241     }
242     { \__hook_if_has_hash:w #1 }
243   }
244 \cs_new:Npn \__hook_if_has_hash_check:w #1 \s__hook_mark
245   { \tl_if_empty:nTF {#1} { \prg_return_false: } { \prg_return_true: } }

(End definition for \__hook_if_has_hash:nTF, \__hook_if_has_hash:w, and
\__hook_if_has_hash_check:w.)

```

```

\__hook_double_hashes:n \__hook_double_hashes:n loops through the token list #1 and duplicates any catcode 6
\__hook_double_hashes:w token, and expands tokens \ifx-equal to \c__hook_hash_tl, and leaves all other tokens
\__hook_double_hashes_output:N \notexpanded with \exp_not:N. Unfortunately pairs of explicit catcode 1 and catcode 2
\__hook_double_hashes_stop:w character tokens are normalised to {1 and }1 because it's not feasible to expandably
\__hook_double_hashes_group:n detect the character code (maybe it could be done using something along the lines of
\__hook_double_hashes_space:w https://tex.stackexchange.com/a/527538, but it's far too much work for close to
zero benefit).

```

__hook_double_hashes:w is the tail-recursive loop macro, that tests which of the three types of item is in the head of the token list.

```

246 \cs_new:Npn \__hook_double_hashes:n #1
247   { \__hook_double_hashes:w #1 \q__hook_recursion_tail \q__hook_recursion_stop }
248 \cs_new:Npn \__hook_double_hashes:w #1 \q__hook_recursion_stop
249   {
250     \tl_if_head_is_N_type:nTF {#1}
251     { \__hook_double_hashes_output:N }
252     {
253       \tl_if_head_is_group:nTF {#1}
254       { \__hook_double_hashes_group:n }
255       { \__hook_double_hashes_space:w }
256     }
257     #1 \q__hook_recursion_stop

```

```

258     }
      \_\_hook_double_hashes_output:N checks for the end of the token list, then checks
      if the token is \c\_hook_hash_tl, and if so just leaves it.

```

```
259 \cs_new:Npn \_\_hook_double_hashes_output:N #1
```

```
260   {
      \if_meaning:w \q\_hook_recursion_tail #1
      \_\_hook_double_hashes_stop:w
    \fi:
    \if_meaning:w \c\_hook_hash_tl #1
```

(this \use_i:nnnn uses \fi: and consumes \use:n, the whole \if_catcode:w block,
and the \exp_not:N, leaving just #1 which is \c_hook_hash_tl.)

```
265   \use_i:nnnn
266   \fi:
267   \use:n
268   {
```

If #1 is not \c_hook_hash_tl, then check if its catcode is 6, and if so, leave it doubled
in \exp_not:n and consume the following \exp_not:N #1.

```
269   \if_catcode:w ## \exp_not:N #1
270     \exp_after:wN \use_i:nnnn
271   \fi:
272   \use_none:n
273   { \exp_not:n { #1 #1 } }
274 }
```

If both previous tests returned `false`, then leave the token unexpanded and resume the
loop.

```
275   \exp_not:N #1
276   \_\_hook_double_hashes:w
277 }
```

```
278 \cs_new:Npn \_\_hook_double_hashes_stop:w #1 \q\_hook_recursion_stop { \fi: }
```

Dealing with spaces and grouped tokens is trivial:

```
279 \cs_new:Npn \_\_hook_double_hashes_group:n #1
280   { { \_\_hook_double_hashes:n {#1} } \_\_hook_double_hashes:w }
281 \exp_last_unbraced:NNo
282 \cs_new:Npn \_\_hook_double_hashes_space:w \c_space_tl
283   { ~ \_\_hook_double_hashes:w }
```

(End definition for __hook_double_hashes:n and others.)

4.5.2 Patching by retokenization

At this point we've drained the possibilities of patching a command by expansion-and-redefinition,
so we have to resort to patching by retokenizing the command. Patching by retokenization is done by getting the \meaning of the command, doing the necessary manipulations on the generated string, and the retokenizing that again by using \scantokens.

Patching by retokenization is definitely a riskier business, because it relies that the tokens printed by \meaning produce the exact same tokens as the ones in the original definition. That is, the catcode régime must be exactly(ish) the same, and there is no way of telling except by trial and error.

__hook_retokenize_patch:Nnn This is the macro that will control the whole process. First we'll try out one final, rather trivial case, of a command with no arguments; that is, a token list. This case can be patched with the expand-and-redefine routine but it has to be the very last case tested for, because most (all?) robust commands start with a top-level macro with no arguments, so testing this first would short-circuit \robust@command@act and the top-level macros would be incorrectly patched. In that case, we just check if the \cs_argument_spec:N is empty, and call __hook_patch_expand_redefine:NNnn.

```

284 \cs_new_protected:Npn \_\_hook_retokenize_patch:Nnn #1 #2 #3
285   {
286     \_\_hook_patch_debug:x { ...~command~can~only~be~patched~by~rescanning }
287     \str_if_eq:eeTF { \cs_argument_spec:N #1 } { }
288       { \_\_hook_patch_expand_redefine:NNnn \c_false_bool #1 {#2} {#3} }
289   }

```

Otherwise, we start the actual patching by retokenization job. The code calls __hook_try_patch_with_catcodes:Nnnnw with a different catcode setting:

- The current catcode setting;
- Switching the catcode of @;
- Switching the expl3 syntax on or off;
- Both of the above.

If patching succeeds, __hook_try_patch_with_catcodes:Nnnnw has the side-effect of patching the macro #1 (which may be an internal from the command whose name is #2).

```

290   \tl_set:Nx \l__hook_tmpa_tl
291   {
292     \int_compare:nNnTF { \char_value_catcode:n {'\@ } } = { 12 }
293       { \exp_not:N \makeatletter } { \exp_not:N \makeatother }
294   }
295   \tl_set:Nx \l__hook_tmpb_tl
296   {
297     \bool_if:NTF \l__kernel_expl_bool
298       { \ExplSyntaxOff } { \ExplSyntaxOn }
299   }
300   \use:x
301   {
302     \exp_not:N \_\_hook_try_patch_with_catcodes:Nnnnw
303       \exp_not:n { #1 {#2} {#3} }
304     { \prg_do_nothing: }
305     { \exp_not:V \l__hook_tmpa_tl } % @
306     { \exp_not:V \l__hook_tmpb_tl } % _:
307   }
308   \exp_not:V \l__hook_tmpa_tl % @
309   \exp_not:V \l__hook_tmpb_tl % _:
310 }
311 \q_recursion_tail \q_recursion_stop

```

If no catcode setting succeeds, give up and raise an error. The command isn't changed in any way in that case.

```

313   {
314     \msg_error:nnxx { hooks } { cant-patch }

```

```

315             { \c_backslash_str #2 } { retok }
316         }
317     }
318 }
```

(End definition for `_hook_retokenize_patch:Nnn.`)

`_hook_try_patch_with_catcodes:Nnnw`

This function is a simple wrapper around `_hook_cmd_if_scannable:NnTF` and `_hook_patch_retokenize:Nnn` if the former returns `<true>`, plus some debug messages.

```

319 \cs_new_protected:Npn \_hook_try_patch_with_catcodes:Nnnw #1 #2 #3 #4
320 {
321     \quark_if_recursion_tail_stop_do:nn {#4} { \use:n }
322     \_hook_patch_debug:x { ++~trying~to~patch~by~retokenization }
323     \_hook_cmd_if_scannable:NnTF {#1} {#4}
324     {
325         \_hook_patch_debug:x { +++macro~can~be~retokenized~cleanly }
326         \_hook_patch_debug:x { ===retokenizing~macro~now }
327         \_hook_patch_retokenize:Nnn #1 {#2} {#3} {#4}
328         \use_i_delimit_by_q_recursion_stop:nw \use_none:n
329     }
330     {
331         \_hook_patch_debug:x { ---macro~cannot~be~retokenized~cleanly }
332         \_hook_try_patch_with_catcodes:Nnnw #1 {#2} {#3}
333     }
334 }
```

(End definition for `_hook_try_patch_with_catcodes:Nnnw.`)

`\kerneltmpDoNotUse`

This is an oddity required to be safe (as safe as reasonably possible) when patching the command. The entirety of

`<prefixes> \def <cs> <parameter text> {<replacement text>}`

will go through `\scantokens`. The `<parameter text>` and `<replacement text>` are what we are trying to retokenize, so not much worry there. The other items, however, should “just work”, so some care is needed to not use too fancy catcode settings. Therefore we can’t use an `expl3`-named macro for `<cs>`, nor the `expl3` versions of `\def` or the `<prefixes>`. That is why the definitions that will eventually go into `\scantokens` will use the oddly (but hopefully clearly)-named `\kerneltmpDoNotUse`:

```
335 \cs_new_eq:NN \kerneltmpDoNotUse !
```

PhO: Maybe this can be avoided by running the `<parameter text>` and the `<replacement text>` separately through `\scantokens` and then putting everything together at the end.

(End definition for `\kerneltmpDoNotUse.`)

`_hook_patch_required_catcodes:`

Here are the catcode settings that are *mandatory* when retokenizing commands. These are the minimum necessary settings to perform the definitions: they identify control sequences, which must be escaped with `\0`, delimit the definition with `{1` and `}2`, and mark parameters with `#6`. Everything else may be changed, but not these.

```

336 \cs_new_protected:Npn \_hook_patch_required_catcodes:
337 {
338     \char_set_catcode_escape:N \\
339     \char_set_catcode_group_begin:N \{
340     \char_set_catcode_group_end:N \}
```

```

341   \char_set_catcode_parameter:N \#
342   % \int_set:Nn \tex_endlinechar:D { -1 }
343   % \int_set:Nn \tex_newlinechar:D { -1 }
344 }
```

PhO: etoolbox sets the `\endlinechar` and `\newlinechar` when patching, but as far as I tested these didn't make much of a difference, so I left them out for now. Maybe `\newlinechar=-1` avoids a space token being added after the definition.

PhO: If the patching is split by `\{parameter text\}` and `\{replacement text\}`, then only `#` will have to stay in that list.

PhO: Actually now that we patch `\UseHook{cmd/foo/before}`, all the tokens there need to have the right catcodes, so this list now includes all lowercase letters, U and H, the slash, and whatever characters in the command name... sigh...

(End definition for `_hook_patch_required_catcodes:..`)

`_hook_cmd_if_scannable:NnTF` Here we'll do a quick test if the command being patched can in fact be retokenized with the specific catcode setting without changing in meaning. The test is straightforward:

1. apply `\meaning` to the command;
2. split the `\{prefixes\}`, `\{parameter text\}` and `\{replacement text\}` and arrange them as
 $\{prefixes\} \def \kerneltmpDoNotUse \{parameter text\} \{replacement text\}$
3. rescan that with the given catcode settings, and do the definition; then finally
4. compare `\kerneltmpDoNotUse` with the original command.

If both are `\ifx`-equal, the command can be safely patched.

```

345 \prg_new_protected_conditional:Npnn \_hook_cmd_if_scannable:Nn #1 #2 { TF }
346 {
347   \cs_set_eq:NN \kerneltmpDoNotUse \scan_stop:
348   \cs_set_eq:NN \_hook_tmp:w \scan_stop:
349   \use:x
350   {
351     \cs_set:Npn \_hook_tmp:w
352       #####1 \tl_to_str:n { macro: } #####2 -> #####3 \s__hook_mark
353       { #####1 \def \kerneltmpDoNotUse #####2 {#####3} }
354     \tl_set:Nx \exp_not:N \l__hook_tmpa_tl
355       { \exp_not:N \_hook_tmp:w \token_to_meaning:N #1 \s__hook_mark }
356   }
357   \tl_rescan:nV { #2 \_hook_patch_required_catcodes: } \l__hook_tmpa_tl
358   \token_if_eq_meaning:NNTF #1 \kerneltmpDoNotUse
359   { \prg_return_true: }
360   { \prg_return_false: }
361 }
```

(End definition for `_hook_cmd_if_scannable:NnTF`.)

`_hook_patch_retokenize:Nnnn` Then, if `_hook_cmd_if_scannable:NnTF` returned true, we can go on and patch the command.

```

362 \cs_new_protected:Npn \_hook_patch_retokenize:Nnnn #1 #2 #3 #4
363 {
```

Start off by making some things `\relax` to avoid lots of `\noexpand` below.

```
364     \cs_set_eq:NN \kerneltmpDoNotUse \scan_stop:
365     \cs_set_eq:NN \__hook_tmp:w \scan_stop:
366     \use:x
367     {
```

Now we'll define `__hook_tmp:w` such that it splits the `\meaning` of the macro (#1) into its three parts:

```
#####1. <prefixes>
#####2. <parameter text>
#####3. <replacement text>
```

and arrange that a complete definition, then place the `before` or `after` hooks around the `<replacement text>`: accordingly.

```
368     \cs_set:Npn \__hook_tmp:w
369     #####1 \tl_to_str:n { macro: } #####2 -> #####3 \s__hook_mark
370     {
371     #####1 \def \kerneltmpDoNotUse #####
372     {
373         \str_if_eq:nnT {#3} { before }
374         { \token_to_str:N \UseHook { cmd / #2 / #3 } }
375     #####3
376         \str_if_eq:nnT {#3} { after }
377         { \token_to_str:N \UseHook { cmd / #2 / #3 } }
378     }
379 }
```

Now we just have to get the `\meaning` of the command being patched and pass it through the meat grinder above.

```
380     \tl_set:Nx \exp_not:N \l__hook_tmpa_tl
381     { \exp_not:N \__hook_tmp:w \token_to_meaning:N #1 \s__hook_mark }
382 }
```

Now rescan with the given catcode settings (overridden by the `__hook_patch_required_catcodes:`), and implicitly (by using the rescanned token list) carry out the definition from above.

```
383     \tl_rescan:nV { #4 \__hook_patch_required_catcodes: } \l__hook_tmpa_tl
```

And to close, copy the newly-defined command into the old name and the patching is finally completed:

```
384     \cs_gset_eq:NN #1 \kerneltmpDoNotUse
385 }
```

(End definition for `__hook_patch_retokenize:Nnnn`.)

1 Counters

This section deals with counter and other variable allocation.

1 `(*2ekernel)`

The following are from plain TEX:

\z@ A zero dimen or number. It's more efficient to write `\parindent\z@` than `\parindent 0pt`.

\cne The number 1.

\m@cne The number -1.

\tw@ The number 2.

\sixt@@n The number 16.

\c@m The number 1000.

\c@MM The number 20000.

\c@xxxii The constant 32.

2 `\chardef\c@xxxii=32`

(End definition for \c@xxxii.)

\c@Mi Constants 10001–10004.

\c@mii 3 `\mathchardef\c@Mi=10001`

\c@miii 4 `\mathchardef\c@Mii=10002`

\c@miv 5 `\mathchardef\c@Miii=10003`

6 `\mathchardef\c@Miv=10004`

(End definition for \c@Mi and others.)

\c@tempcnta Scratch count registers used by LATEX kernel commands.

\c@tempcntb 7 `\newcount\c@tempcnta`

8 `\newcount\c@tempcntb`

(End definition for \c@tempcnta and \c@tempcntb.)

\c@if@tempswa General boolean switch used by LATEX kernel commands.

9 `\newif\c@if@tempswa`

(End definition for \c@if@tempswa.)

\c@tempdima Scratch dimen registers used by LATEX kernel commands.

\c@tempdimb 10 `\newdimen\c@tempdima`

\c@tempdimc 11 `\newdimen\c@tempdimb`

12 `\newdimen\c@tempdimc`

(End definition for \c@tempdima, \c@tempdimb, and \c@tempdimc.)

\@tempboxa Scratch box register used by L^AT_EX kernel commands.
 13 \newbox\@tempboxa
 (End definition for \@tempboxa.)

\@tempskipa Scratch skip registers used by L^AT_EX kernel commands.
 14 \newskip\@tempskipa
 15 \newskip\@tempskipb
 (End definition for \@tempskipa and \@tempskipb.)

\@temptokena Scratch token register used by L^AT_EX kernel commands.
 16 \newtoks\@temptokena
 (End definition for \@temptokena.)

\@flushglue Glue used for \right- & \leftskip = 0pt plus 1fil
 17 \newskip\@flushglue \@flushglue = 0pt plus 1fil
 (End definition for \@flushglue.)

1 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
1  {*2ekernel}
2  \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
    while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
    while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to A1,A2,
... ,An .
    Executes BODY n times, with NAME = Ai on the i-th iteration.
    Optimized for the normal case of n = 1. Works for n=0.

\@tfour NAME := LIST \do {BODY}
    if, before expansion, LIST = T1 ... Tn where each Ti is a
    token or {...}, then executes BODY n times, with NAME = Ti
    on the i-th iteration. Works for n=0.
```

NOTES: 1. These macros use no `\@temp` sequences.
2. These macros do not work if the body contains anything that looks syntactically to TeX like an improperly balanced `\if` `\else` `\fi`.

```
\@whilenum TEST \do {BODY} ==
BEGIN
  if TEST
  then BODY
    \@iwhilenum{TEST \relax BODY}
END

\@iwhilenum {TEST BODY} ==
BEGIN
  if TEST
  then BODY
```

```

        \cnextwhile = def(\@iwhilenum)
else  \cnextwhile = def(\@whilenoop)
fi
\cnextwhile {TEST BODY}
END

\@whilesw SWITCH \fi {BODY} ==
BEGIN
if SWITCH
then BODY
\@iwhilesw {SWITCH BODY}\fi
fi
END

\@iwhilesw {SWITCH BODY} \fi ==
BEGIN
if SWITCH
then BODY
\cnextwhile = def(\@iwhilesw)
else \cnextwhile = def(\@whileswnoop)
fi
\cnextwhile {SWITCH BODY} \fi
END

```

End of historical L^AT_EX 2.09 comments.

```

1 Error handling and tracing

This section defines L^AT_EX's error commands.

```
1 (*2ekernel)
```

The ‘2ekernel’ code ensures that a \usepackage{autoerr} is essentially ignored if a ‘full’ format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

```
2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion
```

1.1 General commands

\MessageBreak This command prints a new-line inside a message, followed by a continuation line begun with \cmsg@continuation. Normally it is defined to be \relax, but inside messages, it is let to \message@break.

```
3 \let\MessageBreak\relax
```

(End definition for \MessageBreak.)

\GenericInfo This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5   \begingroup
6     \def\MessageBreak{^^J#1}%
7     \set@display@protect
8     \immediate\write\m@ne{#2\on@line.}%
9   \endgroup
10 }
```

(End definition for \GenericInfo.)

\GenericWarning This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12   \begingroup
13     \def\MessageBreak{^^J#1}%
14     \set@display@protect
15     \immediate\write\@unused{^^J#2\on@line.^^J}%
16   \endgroup
17 }
```

(End definition for \GenericWarning.)

- \GenericError This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing `h` to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```

18 \bgroup
19 \lccode`\@`\
20 \lccode`\-=`\
21 \lccode`\}`\
22 \lccode`\{`\
23 \lccode`\T`=\T%
24 \lccode`\H`=\H%
25 \catcode`\ =11\relax%
26 \lowercase{%
27 \egroup%

```

Unfortunately TeX versions older than 3.141 have a bug which means that `^^J` does not force a linebreak in `\message` and `\errmessage` commands. So for these old TeX's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

To appear on the terminal, but if you do not like it, you can always upgrade your TeX! In order for your format to use this version, you must define the macro `\@TeXversion` to be the version number, e.g., 3.14 of the underlying TeX. See the comments in `ltdircheck.dtx`.

```

28 \dimen@\ifx\@TeXversion\undefined4\else\@TeXversion\fi\p@%
29 \ifdim\dimen@>3.14\p@%

```

First the ‘standard case’.

```

30 \DeclareRobustCommand{\GenericError}[4]{%
31 \begingroup%
32 \immediate\write\@unused{}}%

```

(End definition for `\GenericError`.)

<code>\PackageError</code> <code>\PackageWarning</code> <code>\PackageWarningNoLine</code> <code>\PackageInfo</code> <code>\ClassError</code> <code>\ClassWarning</code> <code>\ClassWarningNoLine</code> <code>\ClassInfo</code>	These commands are intended for use by package and class writers, to give information to authors. The syntax is: <pre> \PackageError{<package>}{<error>}{<help>} \PackageWarning{<package>}{<warning>} \PackageWarningNoLine{<package>}{<warning>} \PackageInfo{<package>}{<info>} </pre>
--	---

and similarly for classes. The `Error` commands print the `<error>` message, and present the interactive prompt; if the author types `h`, then the `<help>` information is displayed. The `Warning` commands produce a warning but do not present the interactive prompt. The `WarningNoLine` commands do the same, but don't print the input line number. The `Info` commands write the message to the `log` file. Within the messages, the command `\MessageBreak` can be used to break a line, `\protect` can be used to protect command names, and `\space` is a space, for example:

```
\newcommand{\foo}{FOO}
\PackageWarning{ethel}{%
    Your hovercraft is full of eels,\MessageBreak
    and \protect\foo\space is \foo}
```

produces:

```
Package ethel warning: Your hovercraft is full of eels,

```
253 \gdef\@toodeep{%
254 \@latex@error{Too deeply nested}\@ehd}
```

(End definition for \@toodeep.)

\@badpoptabs Called by \endtabbing when not enough \poptabs have occurred, or by \poptabs when too many have occurred.

```
255 \gdef\@badpoptabs{%
256 \@latex@error{\protect\pushtabs\space and \protect\poptabs
257 \space don't match}\@ehd}
```

(End definition for \@badpoptabs.)

\@badtab Called by \>, \+ , \- or \< when stepping to an undefined tab.

```
258 \gdef\@badtab{%
259 \@latex@error{Undefined tab position}\@ehd}
```

(End definition for \@badtab.)

\@preamerr This error is special: it appears in places where we normally have to \protect expansions. However, to prevent a protection of the error message itself (which would result in the message getting printed not issued on the terminal) we need to locally reset \protect to \relax.

```
260 \gdef\@preamerr#1{%
261 \begingroup
262 \let\protect\relax
263 \@latex@error{\ifcase #1 Illegal character\or
264 Missing @-exp\or Missing p-arg\fi\space
265 in array arg}\@ehd
266 \endgroup}
```

(End definition for \@preamerr.)

\@badlinearg Occurs in \line and \vector command when a bad slope argument is encountered.

```
267 \gdef\@badlinearg{%
268 \@latex@error{%
269 Bad \protect\line\space or \protect\vector
270 \space argument}\@ehb}
```

(End definition for \@badlinearg.)

\@parmoderr Occurs in a float environment or a \marginpar when encountered in inner vertical mode.

```
271 \gdef\@parmoderr{%
272 \@latex@error{Not in outer par mode}\@ehb}
```

(End definition for \@parmoderr.)

\@fltovf Occurs in float environment or \marginpar when there are no more free boxes for storing floats.

```
273 \gdef\@fltovf{%
274 \@latex@error{Too many unprocessed floats}\@ehb}
```

(End definition for \@fltovf.)

\@latexbug Occurs in output routine. This is bad news.

```
275 \gdef\@latexbug{%
276 \@latex@error{This may be a LaTeX bug}{Call for help}}
```

(End definition for \@latexbug.)

\@badcrerr This error was removed and replaced by \@nolnerr.

```
277 \%def\@badcrerr {\@latex@error{Bad use of \protect\\}\@ehc}
```

(End definition for \@badcrerr.)

\@noitemerr \addvspace or \addpenalty was called when not in vmode. Probably caused by a missing \item.

```
278 \gdef\@noitemerr{%
279 \@latex@error{Something's wrong--perhaps a missing %
280 \protect\item}\@ehc}
```

(End definition for \@noitemerr.)

\@notprerr A command that can be used only in the preamble appears after the command \begin{document}.

```
281 \gdef\@notprerr{%
282 \@latex@error{Can be used only in preamble}\@eha}
```

(End definition for \@notprerr.)

\@inmatherr Issued by commands that don't work correctly within math (like \item). There is no real error recovery happening, e.g., the user might get additional errors afterwards.

```
283 \gdef\@inmatherr#1{%
284 \relax
285 \ifmmode
286 \@latex@error{Command \protect#1 invalid in math mode}\@ehc
287 \fi}
```

(End definition for \@inmatherr.)

- \@invalidchar An error for use with invalid characters. This is commented out, since we decided to use catcode 15 instead.

288 %\def\@invalidchar{\@latex@error{Invalid character in input}\@ehc}

(End definition for \@invalidchar.)

As well as the above error commands some error messages are directly coded to save space. The messages already present in L<sup>A</sup>T<sub>E</sub>X2.09 include:

Environment --- undefined

Issued by \begin for undefined environment.

Tab overflow

Occurs in \= when maximum number of tabs exceeded.

\< in mid line

Occurs in \< when it appears in middle of line.

Float(s) lost

In output routine, caused by a float environment or \marginpar occurring in inner vertical mode.

### 1.3 Tracing

The **trace** package implements the commands \traceon and \traceoff that work similar to \tracingall but skip certain code blocks that produce a lot of tracing output being of no interest during debugging (for example loading a font). Code blocks that should be hidden during tracing need to be surrounded by the macros \conditionally@traceoff and \conditionally@traceon.

For the kernel code the **trace** package then redefines a number of macros to include this tracing support.

However, in order to allow any macro package to react to \traceon we also provide dummy definitions for the two commands in the kernel so that they can be used by external packages without the need to distinguish between **trace** being loaded or not.

\conditionally@traceon These are only dummy definitions. For details see the **trace** package.

\conditionally@traceoff

289 \let\conditionally@traceon\@empty

290 \let\conditionally@traceoff\@empty

(End definition for \conditionally@traceon and \conditionally@traceoff.)

# File m

## ltpar.dtx

### 1 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` whenever their function needs to be changed for a long time.

This file here describes the interfaces that have been in the kernel forever, used to implement the scenarios described below. They remain valid but are now augmented in the next file (`ltpara.dtx`) to add hooks to paragraphs. At some point we will consolidate the two files further.

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
  - All list environments (itemize, quote, etc.)
  - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
  - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
  - The mechanism for avoiding page breaks and getting the spacing right after section heads.

#### 1.1 Implementation

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{\VAL}` command. Its function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `\VAL`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@@par` `\@@par` always is defined to be the original TeX `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

- Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace where `\everypar` has been redefined). Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.
- Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```

1 {*2ekernel}
2 \message{par ,}

```

`\@setpar` Initiate a long-term change to `\par`.

```

\@par 3 \def\@setpar#1{\def\par{\def\@par{#1}}\def\@par{\@par}}

```

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@@par` after one iteration.

```

4 \def\@par{\let\par\@@par\par}

```

(End definition for `\@setpar` and `\@par`.)

`\@restorepar` Restore from a short-term change to `\par`.

```

5 \def\@restorepar{\def\par{\@par}}
6 {/2ekernel}

```

(End definition for `\@restorepar`.)

# File n

## ltpara.dtx

### Abstract

This code defines four special kernel hooks to support paragraph tagging as well as four public hooks which can be occasionally useful.

## 1 Introduction

The building of paragraphs in the T<sub>E</sub>X engine(s) has a number of peculiarities that makes it on one hand fairly flexible but on the other hand somewhat awkward to control or reliably to extend. Thus to better understand the code below we start with a brief introduction of the mechanism; for more details refer to the T<sub>E</sub>Xbook [?, chap. 14] (for the full truth you may even have to study the program code).

### 1.1 The default processing done by the engine

T<sub>E</sub>X automatically starts building a paragraph when it is currently in vertical mode and encounters anything that can only live in horizontal mode. Most often this is a character, but there are also many commands that can be used only in horizontal mode. If any of them is encountered, T<sub>E</sub>X will immediately back up (i.e., the character or command is read later again), adds a `\parskip` glue to the current vertical list unless the list is empty, switches to horizontal mode, starts its special “start of paragraph processing” and only then rereads the character or command that caused the mode change.<sup>15</sup>

This “start of paragraph processing” first adds an empty box at the start of the horizontal list of width `\parindent` (which represents the paragraph indentation) unless the paragraph was started with `\noindent` in which case no such box is added<sup>16</sup>. It then reads and processes all tokens stored in the special engine token register `\everypar`. After that it reads and processes whatever has caused the paragraph to start.

Thus out of the box, T<sub>E</sub>X offers the possibility to put some special code into `\everypar` to gain control at (more or less) the start of the paragraph. For example, in La<sub>T</sub>e<sub>X</sub> and a number of packages, special code like the following is sometimes used:

```
\everypar{{\setbox\z@\lastbox}\everypar{} ...}
```

This removes the paragraph indentation box again (that was already placed by T<sub>E</sub>X), then resets `\everypar` so that it doesn’t do anything on the next paragraph start and then does whatever it wants to do, e.g., in an `\item` of a list it will typeset the label in front of the paragraph text. However, there is only one such `\everypar` token register and if different packages and/or the kernel all attempt to add their own code here, coordination is very difficult if not impossible.

The process when the paragraph ends has different mechanisms and interfaces. A paragraph ends when the engine primitive `\par` is called while T<sub>E</sub>X is in unrestricted horizontal mode, i.e., is building a paragraph. At other times this primitive does nothing or generates as an error depending on the mode T<sub>E</sub>X is in, e.g., the `\par` in `\hbox{a\par b}` is ignored, but `$a\par b$` would complain.

---

<sup>15</sup>Already not quite true: the command `\noindent` starts the paragraph but influences the special processing by suppressing the paragraph indentation box normally inserted by it.

<sup>16</sup>That’s a bit different from placing a zero-sized box!

If this primitive ends the paragraph it does some special “end of horizontal list” processing, then calls  $\TeX$ ’s paragraph builder; this breaks the horizontal list into lines and then these lines are added as boxes to the enclosing vertical list and  $\TeX$  returns to vertical mode.

This  $\par$  command can be given explicitly, but there are also situations in which  $\TeX$  is generating it on the fly. Most often this happens when  $\TeX$  encounters a blank line which is automatically changed to a  $\par$  command which is then executed. The other possibility is that  $\TeX$  encounters a command which is incompatible with horizontal processing, e.g.,  $\vskip$  (a request for adding vertical space). In such cases it silently backs up, and inserts a  $\par$  in the hope that this gets it out of horizontal mode and makes the vertical command acceptable.

The important point to note here is that  $\TeX$  really inserts the command with the name  $\par$ , which can be redefined. Thus, it may not have its original “primitive” meaning and therefore may not end the horizontal list and call the paragraph builder. This approach offers some flexibility but also allows you to easily produce a  $\TeX$  document that loops forever, for example, the simple line

```
A \let\par\relax \vskip
```

will start a horizontal list at A, redefines  $\par$ , then sees  $\vskip$  and inserts  $\par$  to end the paragraph. But this now only runs  $\relax$  so nothing changes and  $\vskip$  is read again, issues a  $\par$  which .... In short, it only takes a plain  $\TeX$  document with five tokens to run forever (since no memory is consumed and therefore eventually exhausted).

There is no way other than changing  $\par$  to gain control at the end of a paragraph, i.e., there is no token list like  $\everypar$  that is inserted. Hence the only way to change the default behavior is to modify the action that  $\par$  executes, with similar issues as outlined before: different processes need to ensure that they do not overwrite their modifications or worse, think that the  $\par$  in front of them is the engine primitive while in fact it has already been changed by other code.

To make matters slightly worse there are a few places where  $\TeX$  handles the situation differently (most likely for speed reasons back when computers were much slower). If  $\TeX$  finds itself in unrestricted horizontal mode at the end of building a vertical box (for an  $\insert$ ,  $\vadjust$  or executing the output routine code), it will finish the horizontal list not by issuing a  $\par$  command (which would be consistent with all other places) but by simply executing the primitive meaning of  $\par$ , regardless of the actual definition that  $\par$  has at the time.

Thus, if you have carefully crafted a redefined  $\par$  to execute some special actions at the end of a paragraph and you write something like

```
\vbox{Some paragraph ... text.}
```

you will find that your code does not get run for the last paragraph in that box.  $\LaTeX$  avoids this problem, by making sure that its boxes (such as  $\parbox$  or the  $\minipage$  environment, etc.) all internally add an explicit  $\par$  at the end so that such code is run and  $\TeX$  finds itself in vertical mode already without the need to start up the paragraph builder internally. But, of course, this only works for boxes under direct control of the  $\LaTeX$  kernel; if some package uses low-level  $\vbox$ es without adding this precaution the  $\TeX$  optimization kicks in and no special  $\par$  code is executed.

And there is another optimization that is painful: if a paragraph is interrupted by a mathematical display, e.g.,  $\[...]$  in  $\LaTeX$  or  $$$...$$$  in plain  $\TeX$ , then  $\TeX$  will resume horizontal mode afterward, i.e., it will start to build a new horizontal list

without inserting an indentation box or `\everypar` at that point. However, if that list immediately ends with an explicit or implicit `\par` then TeX will simply throw away this “null” paragraph and not do its usual “end of horizontal list” processing, so this special case also needs to be accounted for when introducing any extended processing.

## 2 The new mechanism implemented for L<sup>A</sup>T<sub>E</sub>X

To improve the situation (and also to support automatic tagging of PDF documents) we now offer public as well as private hooks at the start and end of the paragraph processing. The public hooks can be used by packages (or by the user in the preamble or within the document) and using the hook mechanisms it is possible to reorder or arrange code from different packages in such a way that these can safely coexist.

To make that happen we have to make use of the basic functionality that is offered by TeX, e.g., we install special code inside `\everypar` to provide hooks at the beginning and we redefine `\par` to do some special processing when appropriate to install hooks at the end of the paragraph.

In order to make this work, we have to ensure that package use of `\everypar` is not overwriting our code. This is done through a trick: we basically hide the real `\everypar` from the packages and offer them a new token register (with the same name). So if they install their own code it doesn’t overwrite ours. Our code then inserts the new `\everypar` at the right place inside the process so that it looks as if it was the primitive `\everypar`.<sup>17</sup>

At the end of the paragraph it would be great if we could use a similar trick. However, due to the fact that TeX inserts the token `\par` (that doesn’t have a defined meaning) we can’t hide “the real thing™” and offer the package an indistinguishable alternate.

Fortunately, L<sup>A</sup>T<sub>E</sub>X has already redefined `\par` for its own purposes. As a result there aren’t many packages that attempt to change `\par`, because without a lot of extra care that would fail miserably. But the bottom line is that, if you load a package that alters `\par` then the end of paragraph hooks are most likely not executing while that redefinition is active.<sup>18</sup>

---

<sup>17</sup>Ideally, `\everypar` wouldn’t be used at all by packages and instead they would simply write their code into the hooks now offered by the kernel. However, while this is the longterm goal and clearly an improvement (because then the packages do no longer need to worry about getting their code overwritten or needing to account for already existing code in `\everypar`), this will not happen overnight. For that reason support for this legacy method is retained.

<sup>18</sup>Similarly to the `\everypar` situation, the remedy is that such packages stop doing this and instead add their alterations into the paragraph hooks now provided.

## 2.1 The provided hooks

---

**para/before** The following four public hooks are defined and executed for each paragraph:  
**para/begin**  
**para/end**  
**para/after** **para/before** This hook is executed after the kernel hook `\@kernel@before@para@before` (discussed below) in vertical mode immediately after TeX has contributed `\parskip` to the vertical list and before the actual paragraph processing in horizontal mode starts.

This hook should either not produce any typeset material or add only vertical material. If it starts a paragraph an error is generated. The reason is that we are in the starting process of processing a paragraph and so this would lead to endless recursion.<sup>19</sup>

**para/begin** This hook is executed after the kernel hook `\@kernel@before@para@begin` (discussed below) in horizontal mode immediately before the indentation box is placed (if there is any, i.e., if the paragraph hasn't been started with `\noindent`).

The indentation box to be typeset is available to the hook as `\IndentBox` and its automatic placement (after the hook is executed) can be prevented through `\OmitIndent`. More precisely `\OmitIndent` voids the box.

The indentation box is then typeset directly after the hook execution by something equivalent to `\box\IndentBox` followed by the current content of the token register `\everypar` that it is available to the kernel or to packages (that run some legacy code).

One has to be careful not to add any code to the hook that starts its own paragraph (e.g., by adding a `\parbox` or a `\marginpar` inside) because that would call the hook inside again (as a new paragraph is started there) and thus lead to an endless recursion ending only after exhausting the available memory. This can only be done by making sure that is not executed for the inner paragraphs (or at least not recursively forever).

**para/end** This hook is executed at the end of a paragraph when TeX is ready to return to vertical mode and after it has removed the last horizontal glue (but not any kerns) placed on the horizontal list. The code is still executed in horizontal mode so it is possible to add further horizontal material at this point, but it should not alter the mode (even a temporary exit from horizontal mode would create chaos—any attempt will cause an error message)! After the hook has ended the kernel hook `\@kernel@after@para@end` is executed and then TeX returns to vertical mode.

The hook is offered as public hook, but because of the requirement to stay within horizontal mode one needs to be careful in what is placed into the hook.<sup>20</sup>

This hook is implemented as a reversed hook.

**para/after** This hook is executed directly after TeX has returned to vertical mode and after any material that migrated out of the horizontal list (e.g., from a `\vadjust`) has processed.

---

<sup>20</sup>Maybe we should guard against that, but it would be rather tricky to implement as mode changes can happen across group boundaries so one would need to keep a private stack just for that. Well, something to ponder.

This hook should either not produce any typeset material or add only vertical material. However, for this hook starting a new paragraph is not a disaster so that it isn't prevented.

This hook is implemented as a reversed hook.

Once that hook code has been processed the kernel hook `\@kernel@after@para@after` is executed as the final action of the paragraph processing.

---

```
\@kernel@before@para@before
\@kernel@after@para@after
\@kernel@before@para@begin
\@kernel@after@para@end
```

---

As already mentioned above there are also four kernel hooks that are executed at the start and end of the processing.

`\@kernel@before@para@before` For future extensions, not currently used by the kernel.

`\@kernel@after@para@after` For future extensions, not currently used by the kernel.

`\@kernel@before@para@begin` Used by the kernel to implement tagging. This hook is executed at the very beginning of a paragraph after TeX has switched to horizontal mode but before any indentation box got added or any `\everypar` was run.

It should not generate typeset material that could alter the position. Note that it should never leave hmode, otherwise you will end with a loop! We could guard against this, but since it is an internal kernel hook that shouldn't be touched this isn't checked.

`\@kernel@after@para@end` Used by the kernel to implement tagging. It is executed directly after the public `para/end` hook. After it there is a quick check that we are still in horizontal mode, i.e., that the public hook has not mistakenly ended horizontal mode prematurely (this is an incomplete check just testing the mode and could perhaps be improved (at the cost of speed)).

## 2.2 Altered and newly provided commands

---

`\par`  
`\endgraf`  
`\para_end:`

An explicit request for ending a paragraph is provided in plain TeX under the name `\endgraf`, which simply uses the primitive meaning (regardless of what `\par` may have as its current definition). In L<sup>A</sup>T<sub>E</sub>X `\endgraf` (with that behavior) was originally also available.

With the new paragraph handling in L<sup>A</sup>T<sub>E</sub>X, ending a paragraph means a bit more than just calling the engine's paragraph builder: the process also has to add any hook code for the end of a paragraph. Thus `\endgraf` was changed to provide this additional functionality (along with `\par` remaining subject to its current meaning).

The `expl3` name for this functionality is `\para_end:`.

**Note:** *The next two commands are still under discussion and may slightly change their semantics (as described in the document) and/or their names between now and the 2021 Spring release!*

---

`\OmitIndent` Inside the `para/begin` hook one can use this command to suppress the indentation box at the start of the paragraph. (Technically it is possible to use this command outside the hook as well, but this should not be relied upon.) The box itself remains available for use.

The `expl3` name for the function is `\para omit indent:`.

---

`\IndentBox` The box register holding the indentation box for the paragraph is available for inspection (or changes) inside hooks. It remains available even if the `\OmitIndent` command was used; in that case it will just not be automatically placed.

The `expl3` name for the box register is `\g para indent box`.

---

`\RawIndent` `\RawNoindent` `\RawParEnd`  
`\para raw indent:` `\RawNoindent hmode material \RawParEnd`  
`\para raw noindent:` `\RawParEnd`  
`\para raw end:`

The commands `\RawIndent` and `\RawNoindent` are not meant for normal paragraph building (where the result is a textual paragraph in the traditional meaning of the word), but for special cases where TeX's low-level algorithm is used to achieve special effects, but where the result is not a "paragraph".

They are called "raw", because they bypass L<sup>A</sup>T<sub>E</sub>X's hook mechanism for paragraphs and simply invoke the low-level TeX algorithm. I.e., they are like the original TeX primitives `\indent` and `\noindent` (that is they execute no hooks other than `\everypar`) except that they can only be used in vertical mode and generate an error if found elsewhere.

To avoid issues a paragraph started by them should always be ended by `\RawParEnd`<sup>21</sup> and not by `\par` (or a blank line), because the latter will execute hooks which then have no counterpart at the beginning of the paragraph. It is the responsibility of the programmer to make sure that they are properly paired. This also means that one should not put arbitrary user content between these commands if that content could contain stray `\pars`.

The `expl3` names for the functions are `\para raw indent:`, `\para raw indent:` and `\para raw end:`.

## 2.3 Examples

None of the examples in this section are meant for real use as they are far too simple-minded but they should give some ideas of what could be possible if a bit more care is applied.

### 2.3.1 Testing the mechanism

The idea is to output for each paragraph encountered some information: a paragraph sequence number, a level number in roman numerals, the environment in which this paragraph appears, and the line number where the start or end of the paragraph is, e.g., something like

```
PARA: 1-i start (document env. on input line 38)
PARA: 1-i end (document env. on input line 38)
PARA: 2-ii start (minipage env. on input line 40)
PARA: 3-ii start (minipage env. on input line 40)
```

```

PARA: 3-ii end (minipage env. on input line 40)
PARA: 2-i end (document env. on input line 41)

```

As you can see paragraph 2 starts on line 40 and ends on 41 and inside a minipage started paragraph 3 (start and end on line 40). If you run this on some document you will find that L<sup>A</sup>T<sub>E</sub>X considers more things “a paragraph” than you have probably thought.

This was generated by the following hook code:

```

\newcounter{paracnt} % sequence counter
\newcounter{paralevel} % level counter

```

To support paragraph nesting we need to maintain a stack of the sequence numbers. This is most easily done using `expl3` functions, so we switch over. This is not a very general implementation, just enough for what we need and a bit of L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  thrown in as well. When popping, the result gets stored in `\paracntvalue` and the `\ERROR` should never happen because it means we have tried to pop from an empty stack.

```

\ExplSyntaxOn
\seq_new:N \g_para_seq
\cs_new:Npn \ParaPush
 {\seq_gpush:No \g_para_seq {\the\value{paracnt}}}
\cs_new:Npn \ParaPop {\seq_gpop:NNF \g_para_seq \paracntvalue \ERROR }
\ExplSyntaxOff

```

At the start of the paragraph increment both sequence counter and level and also save the then current sequence number on our stack.

```

\AddToHook{para/begin}{%
 \stepcounter{paracnt}\stepcounter{paralevel}%
 \ParaPush
}

```

To display the sequence number we `\typeout` the current sequence and level number. The command `\@currenvir` gives us the current environment and `\on@line` produces a space and the current input line number.

```

\typeout{PARA: \arabic{paracnt}-\roman{paralevel} start
(\@currenvir\space env.\on@line)}%

```

We also typeset the sequence number as a tiny red number in a box that takes up no horizontal space. This helps us seeing where L<sup>A</sup>T<sub>E</sub>X sees the start and end of the paragraphs in the document.

```

\llap{\color{red}\tiny\arabic{paracnt}\ }%
}

```

At the end of the paragraph we display sequence number and level again. The level counter has the correct value but we need to retrieve the right sequence value by popping it off the stack after which it is available in `\paracntvalue` the way we have set this up above.

```

\AddToHook{para/end}{%
 \ParaPop
 \typeout{PARA: \paracntvalue-\roman{paralevel} end \space\space
(\@currenvir\space env.\on@line)}%
}

```

We also typeset again a tiny red number with that value, this time sticking out to the right.<sup>22</sup> We also decrement the level counter since our level has finished.

```
\rlap{\color{red}\tiny\ \paracntvalue}%
\addtocounter{paralevel}{-1}%
}
\makeatother
```

### 2.3.2 Mark the first paragraph of each `itemize`

The code for this is rather simple. We supply some code that is executed only once inside a hook at the start of each `itemize`. We explicitly change the color back and forth so that we don't introduce grouping around the paragraph.

```
\AddToHook{env/itemize/begin}{%
\AddToHookNext{para/begin}{\color{blue}}%
\AddToHookNext{para/end}{\color{black}}%
}
```

As a result the first paragraph of each `itemize` will appear in blue.

## 2.4 Some technical notes

The code tries hard to be transparent for package code, but of course any change means that there is a potential for breaking other code. So in section we collect a few cases that may be of importance if low-level code is dealing with paragraphs that are now behaving slightly differently. The notes are from issues we observed and will probably grow over time.

### 2.4.1 Glue items between paragraphs (found with `fancypar`)

In the past L<sup>A</sup>T<sub>E</sub>X placed two glue items between two consecutive paragraphs, e.g.,

```
text1 \par text2 \par
```

would show something like

```
\glue(\parskip) 0.0 plus 1.0
\glue(\baselineskip) 5.16669
```

but now there is another `\parskip` glue (that is always 0pt):

```
\glue(\parskip) 0.0 plus 1.0
\glue(\parskip) 0.0
\glue(\baselineskip) 5.16669
```

The reason is that we generate a “fake” paragraph to gain control and safely add the early hooks, but this generates an additional glue item. That item doesn't contribute anything vertically but if somebody writes code that unravels a constructed list using `\lastbox`, `\unskip` and `\unpenalty` then the code has to remove one additional glue item or else it will fail.

---

<sup>22</sup>Note that this can alter the document pagination, because a paragraph ending in a display (e.g., an equation) will get an extra line—in that case our tiny number has an effect even though it doesn't take up any space, because it paragraph is no longer empty and thus isn't dropped!

### 3 The Implementation

```
1 <@=para>
2 (*2ekernel | latexrelease)
3 \ExplSyntaxOn
4 (latexrelease) \NewModuleRelease{2021/06/01}{ltpara}
5 (latexrelease) {Paragraph-handling-and-hooks}
```

#### 3.1 Providing hooks for paragraphs

para/before  
para/after  
para/begin  
para/end

The public hooks. They are implemented as a paired set of hooks.

```
6 \hook_new_pair:nn{para/before}{para/after}
7 \hook_new_pair:nn{para/begin}{para/end}
```

(End definition for para/before and others. These functions are documented on page 297.)

\@kernel@before@para@before  
\@kernel@after@para@after  
\@kernel@before@para@begin  
\@kernel@after@para@end

The corresponding kernel hooks (for tagging and future extensions).

```
8 \let \@kernel@before@para@before \empty
9 \let \@kernel@before@para@begin \empty
10 \let \@kernel@after@para@end \empty
11 \let \@kernel@after@para@after \empty
```

(End definition for \@kernel@before@para@before and others. These functions are documented on page 298.)

\g\_para\_standard\_everypar\_tl

Whenever TeX starts a paragraph it inserts first an indentation box and then executes the tokens stored in \tex\_everypar:D (known to LATEX as \everypar). We alter this behavior slightly here, so that hooks are added into the right place. Otherwise the process change remains transparent to any legacy code for this space.

We keep the standard code to be used by \tex\_everypar:D in a separate token list because we have to switch back and forth for error recovery and so altering \tex\_everypar:D all the time should be a tiny bit faster.

```
12 \tl_new:N \g__para_standard_everypar_tl
```

Here is now its definition:

```
13 \tl_gset:Nn \g__para_standard_everypar_tl {
```

First we remove the indentation box and store it in \g\_para\_indent\_box. If there was none because the paragraph was started by \noindent the box register will be void.

```
14 \box_gset_to_last:N \g_para_indent_box
```

This will make the newly started horizontal list empty, so if we stop it now and return to vertical mode it will be dropped by TeX. We do that but inside a group so that any \parshape settings will not get lost as we need them for later.

```
15 \group_begin:
16 \tex_par:D
17 \group_end:
```

We then change \tex\_everypar:D to generate an error so that we can detect and report if the para/before hook illegally changed out of vmode.

```
18 \tex_everypar:D { \msg_error:n { hooks }{ para-mode }{before}{vertical} }
19 \@kernel@before@para@before
20 \hook_use:n {para/before}
```

Assuming the hooks have been well behaved it is time to return to horizontal mode and start the paragraph in earnest. We already have the indentation box saved away so we now have to restart the paragraph with an empty `\tex_everypar:D` and with `\tex_noindent:D`. And we need to make sure not to get another `\parskip` or rather (since we can't prevent that) that it is of zero size.

```

21 \group_begin:
22 \tex_everypar:D {}
23 \skip_zero:N \tex_parskip:D
24 \tex_noindent:D
25 \group_end:
```

That brings us back to the start of the horizontal list but we need to change `\tex_everypar:D` back to its normal content in case there are nested paragraphs coming up.

```
26 \tex_everypar:D{\g_para_standard_everypar_t1}
```

This is followed by executing the kernel and the public hook. The kernel hook is there to enable tagging.

```

27 \@kernel@before@para@begin
28 \hook_use:n {para/begin}
```

If we aren't in horizontal mode any longer the hooks above misbehaved.

```

29 \if_mode_horizontal: \else:
30 \msg_error:nnn { hooks }{ para-mode }{begin}{vertical} \fi:
```

Finally we reinsert the indentation box (unless suppressed) and then call `\everypar` the way legacy L<sup>A</sup>T<sub>E</sub>X code expects it.

However, adding the public `\everypar` is a bit tricky (see below) so we add that later, and indirectly.

```

31 __para_handle_indent:
32 % \the \everypar % <--- done differently below
33 }
```

*(End definition for `\g_para_standard_everypar_t1`.)*

`\tex_everypar:D` `\tex_everypar:D` then only has to execute `\g_para_standard_everypar_t1` by default.

```
34 \tex_everypar:D{\g_para_standard_everypar_t1}
```

*(End definition for `\tex_everypar:D`.)*

`\everypar` Tokens inserted at the beginning of the paragraph are placed into `\everypar` inside legacy L<sup>A</sup>T<sub>E</sub>X code, e.g., by the list environments or by headings to handle `\clubpenalty`, etc. Now this isn't any longer the primitive but simply a toks register used in the code above but to legacy L<sup>A</sup>T<sub>E</sub>X code that is transparent.

There is, however, a problem: a handful packages use exactly the same trick and replace the primitive with a token register and call the token register inside the renamed primitive. That is they assume that `\everypar` is the primitive and that it will still be called at the start of the paragraph even if renamed.

But if we have already replaced it by a token register then all they do is to give that token register a new name. Thus our code in `\tex_everypar:D` would call `\everypar` (which is now their token register) and the code that they added ends up in our token register which is then never used at all. A bit mind boggling I guess.

So what we have to do is not to call the token register `\everypar` by its name inside `\tex_everypar:D` but by using its actual register number.

```
35 \newtoks \everypar
```

After we have allocated a new toks register with the name `\everypar` the actual register number is available (briefly) inside `\allocationnumber`. So instead of `\the\everypar` we have to put `\the\toks<allocated number>` at the end of `\tex_everypar:D`.

So what remains doing is to append a few tokens to the token list `\g__para-standard_everypar_tl` which we do now. We use x expansion here to get the value of `\allocationnumber` in, all the other tokens should not be expanded at this point.

One important point here is to terminate the register allocation number with a real space. This space will get swallowed up when the number is read. Anything else, such as `\scan_stop:` would remain in the input and that would mean that it would interfere with `\everypar` code that attempts to scan ahead to see how the paragraph text starts.

```

36 \tl_gput_right:Nx \g__para_standard_everypar_tl {
37 \exp_not:N \the
38 \exp_not:N \toks
39 \the \allocationnumber
40 \c_space_tl
41 }
```

(End definition for `\everypar`.)

**\g\_para\_indent\_box** For managing the indentation we need to provide a public accessible box register

```
42 \box_new:N \g_para_indent_box
```

(End definition for `\g_para_indent_box`. This function is documented on page 299.)

**\\_\_para\_handle\_indent:** Adding (typesetting) the indent box is straight forward. If it was emptied before it does nothing.

```

43 \cs_new:Npn __para_handle_indent: {
44 \box_use_drop:N \g_para_indent_box
45 }
```

The declaration `\paraomit_indent:` (or `\OmitIndent`) changes that to do nothing.

```

46 \cs_new:Npn \paraomit_indent: {
47 \box_gclear:N \g_para_indent_box
48 }
```

(End definition for `\__para_handle_indent:`)

**\IndentBox** **\OmitIndent** The L<sup>A</sup>T<sub>E</sub>X2 <sub>$\varepsilon$</sub>  names for the indentation box and for suppressing it for use in the para/begin hook.

```

49 \cs_set_eq:NN \IndentBox \g_para_indent_box
50 \cs_set_eq:NN \OmitIndent \paraomit_indent:
```

(End definition for `\IndentBox` and `\OmitIndent`. These functions are documented on page 299.)

**\para\_end:** Adding hooks to the end of a paragraph is similar but here we need to alter the command that is used by T<sub>E</sub>X to end horizontal mode and return to vertical mode, i.e., `\par`.

This is a bit more complicated as this command can appear anywhere either explicitly or implicitly added by T<sub>E</sub>X in certain situations:

- when using `\par` in the code or the document
- when using a blank line (which is converted to `\par`)
- when T<sub>E</sub>X finds any commands incompatible with horizontal mode it issues a `\par` and then rereads the command.

Unfortunately,  $\text{\TeX}$  has some (these days) unnecessary optimizations: if a  $\text{\vbox}$  ends and  $\text{\TeX}$  is still in horizontal mode it simply exercises the paragraph builder instead of issuing a  $\text{\par}$ . It is therefore necessary for  $\text{\LaTeX}$  to ensure that this case doesn't happen and all boxes internally have a  $\text{\par}$  command at their end.

This  $\text{\par}$  may or may not run the “par primitive” (which is always available as  $\text{\tex\_par:D}$  in  $\text{expl3}$ ); it is permissible to have a changed meaning and it is in fact changed by  $\text{\LaTeX}$  in various ways at various points inside  $\text{latex.ltx}$ . For this  $\text{\LaTeX} 2_{\varepsilon}$  code has the following conventions:  $\text{\@@par}$  and  $\text{\endgraf}$  both refer to the default meaning (in the past this was the  $\text{initex}$  primitive) while  $\text{\par}$  is the current meaning which maybe does something else.

We are now going to change this default meaning to instead run  $\text{\para_end:}$ , which ultimately executes the  $\text{initex}$  primitive but additionally adds our hooks when appropriate. This way the change is again transparent to the legacy  $\text{\LaTeX} 2_{\varepsilon}$  code.

In most cases  $\text{\para_end:}$  should behave exactly like the primitive and we achieve this by simply expanding it to the primitive which is available to us as  $\text{\tex_par:D}$ . This way we don't have to care about whether  $\text{\TeX}$  just does nothing (e.g., if in vertical mode already) or generates an error, etc.

```
51 \cs_new_protected:Npn \para_end: {
```

CCC Maybe needs more explanation. TEMP NOTE: What should happen if in outer hmode with an empty hlist?

The only case we care about is when we are in horizontal mode (i.e., doing typesetting) and not also in inner mode (i.e., making paragraphs and not building an  $\text{\hbox}$ ).

```
\bool_lazy_and:nnT
 { \mode_if_horizontal_p: }
 { \bool_not_p:n { \mode_if_inner_p: } }
 { ... }
```

Since this is executed for each and every paragraph in a document we try to stay as fast as possible, so we do not use the above construct but two conditionals instead. Using low-level  $\text{\if_mode...}$  conditions would be even faster but has the danger to conflict with conditionals in the user hooks.

If  $\text{\para_end:}$  is executed while  $\text{\TeX}$  is currently doing a low-level assignment the test for horizontal mode may get executed as part of the assignment. That is normally not an issue but we just found one case where it is:

```
\afterassignment\lst@vskip\@tempskipa \z@\par
```

If  $\text{\TeX}$  is in hmode while that assignment happens then the  $\text{\par}$  is seen in hmode because in the above case the assignment may not be finished (one should have used  $\text{\z@skip}$ ) and the  $\text{\lst@vskip}$  will get inserted into the middle of the conditional. The  $\text{\lst@vskip}$  then changes to vmode and you get a surprising error about the  $\text{para/end}$  hook having changed modes even if you don't have any hook code(!): it is the inserted  $\text{\lst@vskip}$  that is actually causing the change of mode. This is what happened when the output routines got started while a  $\text{lstlisting}$  environment (that redefines  $\text{\vskip}$  in this way) was active. This is really faulty coding, but we try to be proactive and guard the conditional so that any scanning is first stopped, thus:

```
52 \scan_stop:
53 \mode_if_horizontal:TF {
54 \mode_if_inner:F {
```

In that case the action of the primitive would be to remove the last glue (but no kerns) from the horizontal list (constructed to form a paragraph) and then to append a penalty of 10000 and the `\parfillskip`; it then passes the whole list to the paragraph builder, which breaks it into lines and `TEX` then returns to vertical mode.

What we want to do is to add this hook code at the end of the horizontal list before any of the above happens. If there was a glue item at the end of the list then it should get removed before the hook code gets added so we have to arrange for this removal.

As in other simular cases, it maybe best to add here a `\nobreak` in case the hook itself adds glue and thus creates a non-explicit and unwanted potential breakpoont. On the other hand (as has been argued) the code in the hook should perhaps have the responsibility for adding such a guard penalty in this casse. This needs further analysis and decisions (as in emails).

In either case, good documentation of these hooks is essential, covering what the hook may or should provide and all such related considerations converning the content.

There is not much point in checking if there was really a glue item at the end of the horizontal list, instead we simply try to remove one using `\tex_untskip:D`: if there wasn't one this will do nothing.

```
55 \tex_untskip:D
```

We then execute the public hook (which may add some final typeset material) followed by the kernel hook that we need for adding tagging support. None of this is supposed to change the mode—at the moment we make only a very simple test for this, more devious changes go unnoticed, but too bad as they will then probably backfire badly.

```
56 \hook_use:n{para/end}
57 \@kernel@after@para@end
58 \mode_if_horizontal:TF {
```

The final action (before getting to the point where `\tex_par:D` is called) is to add an extra glue item so that the primitive is prevented from removing intended glue (if there was some). If we don't do this and the horizontal list ends in several glue items we would end up removing two glue items instead of just the last one, which would be wrong. We use glue (rather than a kern) as that will be removed by the primitive.

There is however one other `TEX` optimization that hurts: in a sequence like this `$$ ... $$ \par` (with `\par` being the primitive) `TEX` will be in horizontal mode after the display, ready to receive further paragraph text, but since the `\par` follows immediately there is a “null” paragraph at the end and `TEX` simply throws that away. The space between `$$` and `\par` got already dropped during the display processing so the `\par` is not removing any space and appending `\parfillskip`, instead it simply goes silently to vmode.

Now if we would have added something (to prevent glue removal) that would look to `TEX` like material after the display and so we would end up with an empty paragraph just containing a penalty and `\parfillskip`.

We therefore check if the current hlist does end in glue (`\tex_lastnodedtype:D` has the value 11) and if so we add a zero-length guard skip which will be removed by the following `\tex_par:D`.

```
59 \if_int_compare:w 11 = \tex_lastnodedtype:D
60 \tex_hskip:D \c_zero_dim
61 \fi:
```

To run the `para/after` hook we first end the paragraph. This means that the `\tex_par:D` at the very end is unnecessary but executing it there unnecessarily is better than having code that tests for all the different mode possibilities.

```

62 \tex_par:D
63 \hook_use:n{para/after}
64 \kernel@after@para@after
65 }

```

If we were not horizontal mode (the F case from above) then the earlier hook `para/end` must have been at fault, so we report that.

```
66 { \msg_error:nnn { hooks }{ para-mode }{end}{horizontal} }
```

Finally close out the nested conditionals.

```

67 }
68 }

```

And then we can use the primitive to truly end the paragraph.

```

69 \tex_par:D
70 }

```

(*End definition for `\para_end`.. This function is documented on page 298.*)

`\para_raw_indent:` `\para_raw_noindent:` `\para_raw_end:`

To avoid issues a paragraph started by them should always be ended by `\para_raw_end:` and not by `\para_end:` or `\par` as the latter will execute hooks which then have no counterpart at the beginning of the paragraph. It is the responsibility of the programmer to make sure that they are properly paired.

```

71 \cs_new:Npn \para_raw_indent: {
72 \mode_if_vertical:TF
73 {
74 \tex_everypar:D {
75 \box_gset_to_last:N \g_para_indent_box
76 \tex_everypar:D { \g__para_standard_everypar_tl }
77 __para_handle_indent:
78 \the\tex_everypar }
79 }
80 { \msg_error:nn { latex2e }{ raw-para } }
81 \tex_indent:D
82 }
83 \cs_new:Npn \para_raw_noindent: {
84 \mode_if_vertical:TF
85 {
86 \tex_everypar:D {
87 \tex_everypar:D { \g__para_standard_everypar_tl }
88 \the\tex_everypar }
89 }
90 { \msg_error:nn { latex2e }{ raw-para } }
91 \tex_noindent:D
92 }
93 \cs_new_eq:NN \para_raw_end: \tex_par:D

```

(*End definition for `\para_raw_indent`:, `\para_raw_noindent`:, and `\para_raw_end`:. These functions are documented on page 299.*)

```

\RawIndent The LATEX 2< names for starting and ending a paragraph without adding any hooks.
\RawNoIndent 94 \cs_set_eq:NN \RawIndent \para_raw_indent:
\RawParEnd 95 \cs_set_eq:NN \RawNoindent \para_raw_noindent:
96 \cs_set_eq:NN \RawParEnd \para_raw_end:

```

(End definition for \RawIndent, \RawNoIndent, and \RawParEnd. These functions are documented on page 299.)

This ends the para module code.

```
97 <@>
```

```

\par Having the new default definition for \par we also have to set it up so that it gets used.
\endgraf This involves three commands: \par, \@@par (to which LATEX resets \par occasionally)
\@@par and \endgraf, which is another name for the “default” action of \par.

```

```

98 \cs_set_eq:NN \par \para_end:
99 \cs_set_eq:NN \@@par \para_end:
100 \cs_set_eq:NN \endgraf \para_end:

```

(End definition for \par, \endgraf, and \@@par. These functions are documented on page 298.)

While this is not integrated properly into the format we have to redo the \everypar setting from the kernel, otherwise that gets lost (as it happens before that file is loaded).

```
101 \everypar{\@nodocument} %% To get an error if text appears before the
```

## 3.2 The error messages

This one is used when we detect that some hook code has changed the mode where it shouldn’t, e.g., by starting or ending a paragraph. The first argument is the hook name second the mode it should have stayed in but didn’t.

```

102 \msg_new:nnnn { hooks } { para-mode }
103 {
104 Illegal~mode~ change~ in~ hook~ 'para/#1'.\\
105 Hook~ code~ did~ not~ remain~ in~ #2~ mode.
106 }
107 {
108 Paragraph~ hooks~ cannot~ change~ the~ TeX~ mode~ without~ causing~
109 endless~ recursion.~ The~ hook~ code~ in~ 'para/#1'~ needs~ to~ stay~
110 in~ #2~ mode,~ but~ it~ didn't.~ Examine~ the~ hook~
111 code~ with~ \iow_char:N \\ShowHook~ to~ find~ the~ issue.
112 }

```

And here is one used in the “raw” commands when they are used outside of vertical mode.

```

113 \msg_new:nnnn { latex2e } { raw-para }
114 {
115 Not~ in~ vertical~ mode.
116 }
117 {
118 Starting~ a~ paragraph~ with~ \iow_char:N \\RawIndent~ or~
119 \iow_char:N \\RawNoindent \\
120 (or~ \iow_char:N \\para_raw_indent:~ or~
121 \iow_char:N \\para_raw_noindent:)~ is~ only~ allowed \\
122 if~ LATEX~ is~ in~ vertical~ mode.
123 }

```

```

## ltmeta.dtx

### Abstract

This code defines the `\DocumentMetadata` interface.

## 1 Introduction

In the past there was no dedicated location to declare settings concerning a document as a whole. Settings are placed somewhere in the preamble or with the class options or even with some package options. For some settings this can be too late, for example the pdf version can no longer be changed if a package has used code which already opened the PDF.

`\DocumentMetadata` as a new command unifies such settings in one place. It must be used before `\documentclass` but can be issued more than once there.

At the moment most of the code run by `\DocumentMetadata` is external to the format and subject to change. This includes the supported key/values.

For that reason all that happens right now in the format is to look for suitable support files and if found, to redirect the processing to them.

### 1.1 `\DocumentMetadata`

---

```
\DocumentMetadata \DocumentMetadata{\{key-value list\}}
```

---

The keys defined for `\DocumentMetadata` currently allow to set the PDF version, to set the PDF `/Lang`, to uncompress a PDF, to set the language and to declare a few PDF standards and some color profiles.

`\DocumentMetadata` is also used to activate the new PDF management code and it loads a number of required files for the PDF management code. As this forces the loading of the backend files, a backend which can't be detected automatically like `dvipdfmx`, must be set in the first `\DocumentMetadata` call (if there is more than one).

The full set of keys currently supported is documented in `documentmetadata-support.pdf` for now.

## 2 The Implementation

```
1 {*2ekernel | latexrelease}
Not needed yet but ...
2 %\ExplSyntaxOn
3 \let \IfDocumentMetadataTF \@secondoftwo
4 \protected\def\DocumentMetadata{%
5 \IfDocumentMetadataTF \@secondoftwo
6 \InputIfFileExists{documentmetadata-support.ltx}%
7 {}%
8 }%
```

The above file is changing `\DocumentMetadata` to a suitable definition (or so we hope), so that we can try again — if not tough.

If the file can't be found we say so and carry on without it.

```

9 {%
10 \@latex@error{No support files for
11 \noexpand\DocumentMetadata found}
12 {Is the 'LaTeX-lab' bundle installed?%
13 \MessageBreak
14 Without it, the declaration is ignored.}%

```

No point in trying this more than once if there are several calls in the document.

```

15 \let\DocumentMetadata\@gobble
16 }%
17 \let \IfDocumentMetadataTF \@firstoftwo
18 \DocumentMetadata
19 }

```

To allow package and class author to support for document links we provide also the new interface commands of the hyperref package for the creation of targets.

```

\MakeLinkTarget
 \LinkTargetOn
 \LinkTargetOff
\NextLinkTarget
20 \NewDocumentCommand\MakeLinkTarget{s0{}m}{%
21 \ifvmode
22 \special{}%
23 \else
24 \@savsf\spacefactor
25 \smash{}%
26 \spacefactor@savsf
27 \fi}
28 \NewDocumentCommand\LinkTargetOn{}{}
29 \NewDocumentCommand\LinkTargetOff{}{}
30 \NewDocumentCommand\NextLinkTarget{m}{}

```

*(End definition for `\MakeLinkTarget` and others.)*

We do not undo `\MakeLinkTarget` and friends if we roll back, in case they are used in packages that themselves do not offer rollback. This way a roll forward adds them, but the dummies remain if you roll back and you don't get missing csname errors if they are used.

```

31 <| latexrelease> \IncludeInRelease{0000/00/00}{ltmeta}%
32 <| latexrelease> {Undo Document Metadata handling}
33 <| latexrelease>
34 <| latexrelease> \let\DocumentMetadata\@undefined
35 <| latexrelease>
36 <| latexrelease> \EndModuleRelease

```

Again for the future ...

```

37 %\ExplSyntaxOff
38 </2ekernel | latexrelease>

```

Restore module prefix (if any):

```

39 <@@=
```

# File p

## ltspace.dtx

### 1 Spacing

This section deals with spacing, and line- and page-breaking.

#### 1.1 User Commands

```
\nopagebreak [⟨i⟩] : ⟨i⟩ = 0,...,4.
 Default argument = 4. Puts a penalty into the vertical list output as follows:
0 : penalty = 0
1 : penalty = \@lowpenalty
2 : penalty = \@medpenalty
3 : penalty = \@highpenalty
4 : penalty = 10000
\pagebreak [⟨i⟩] : same as except negatives of its penalty
\linebreak [⟨i⟩] : analog of the above
\nolinebreak [⟨i⟩] : analog of the above
\samepage : inhibits page breaking most places by setting the following penalties to 10000:
 \interlinepenalty
 \postdisplaypenalty
 \interdisplaylinepenalty
 \@beginparpenalty
 \@endparpenalty
 \@itempenalty
 \@secpenalty
 \interfootnotelinepenalty
\ : initially defined to be \newline
 \\[⟨length⟩] : initially defined to be \vspace{⟨length⟩}\newline
Note: * adds a \vadjust{\penalty 10000}
 OBSOLETE COMMANDS (which never made it into the manual):
 \obeycr : defines <CR> == \\relax
 \restorecr : restores <CR> to its usual meaning.
```

#### 1.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
 \item \label{item:xxx} Item text.
\end{enumerate}
```

### 1.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `\*\*`.
- Reimplement `\\"`, etc, removing extra `\vadjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\\"`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskip`s include test for zero skip (rather than other tests or no test).
- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.

- Resolve the inconsistency between `\hspace` and `\hspace*`.
- Remove unnecessary `\unskip`s.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix TeX itself.

## 1.4 The code

```

119 \else \z@\fi}

```

(End definition for `\@getpen`.)

`\if@nobreak` Switch used to avoid page breaks caused by `\label` after a section heading, etc. It should be **GLOBALLY** set true after the `\nobreak` and `globally` set false by the next invocation of `\everypar`.

Commands that reset `\everypar` should globally set it false if appropriate.

```

120 \def\@nobreakfalse{\global\let\if@nobreak\iffalse}
121 \def\@nobreaktrue {\global\let\if@nobreak\iftrue}
122 \z@\nobreakfalse

```

(End definition for `\if@nobreak`.)

`\@savsk` Registers used to save the space factor and last skip.

```

123 \newdimen\@savsk
124 \newcount\@savsf

```

(End definition for `\@savsk` and `\@savsf`.)

\@bsphack \@bsphack and \@esphack used by macros such as \index and \begin{@float} ... \end{@float} that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with \@bsphack and end with \@esphack. The macro in question should not create any text, nor change the mode.

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when ‘invisible commands’ appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following \addvspace, etc sees the correct glue in \lastskip.

In fact, these improved versions should be used for other cases of ‘whatsits, thingies etc’ which should be invisible. They are only for commands, not environments (see notes on \@EspHack).

BTW, anyone know why the standard hacks are surrounded by \ifmmode\else rather than simply \ifhmode?

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
def \@bsphack{%
 \relax \ifvmode
 \@savsk \lastskip
 \ifdim \lastskip=\z@
 \else
 \vskip -\lastskip
 \fi
\else
 \ifhmode
 \@savsk \lastskip
 \@savsf \spacefactor
 \fi
\fi
```

I think that, in vmode, it is the safest to put in a \nobreak immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
def \@esphack{%
 \relax \ifvmode
 \nobreak
 \ifdim \@savsk=\z@
 \else
 \vskip\@savsk
 \fi
\else
 \ifhmode
 \spacefactor \@savsf
 \ifdim \@savsk>\z@
 \ignorespaces
 \fi
 \fi
```

```

\fi
\fi
```

For the moment we are going to ignore the vertical versions until they are correct.

```

125 \def\@bsphack{%
126 \relax
127 \ifhmode
128 \csavsk\lastskip
129 \csavsf\spacefactor
130 \fi}
```

(End definition for `\@bsphack`.)

- `\@esphack` Companion to `\@bsphack`. If this command is not properly paired with `\@bsphack` one might end up with a low-level TeX error: “BAD spacefactor”. One possible cause is calling `\@bsphack` in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling `\@esphack`. Even if no error is generated that is wrong, because `\@esphack` will then use the saved values for `\@savsk` and `\@savsf` from some earlier invocation of `\@bsphack` which will have nothing to do with the current situation.

\@vbsphack Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \@savsk is nonzero so that the \ignorespaces is put in later. It is not used at present.

```

\def \@vbsphack{ %
 \relax \ifvmode
 \leavevmode
 \@savsk 1sp
 \@savsf \spacefactor
 \else
 \ifhmode
 \@savsk \lastskip
 \@savsf \spacefactor
 \fi
 \fi
}

```

(End definition for \@vbsphack.)

## 1.5 Vertical spacing

L<sup>A</sup>T<sub>E</sub>X supports the plain T<sub>E</sub>X commands \smallskip, \medskip and \bigskip. However, it redefines them using \vspace instead of \vskip.

Extra vertical space is added by the command \addvspace{\<skip>}, which adds a vertical skip of <skip> to the document. The sequence \addvspace{\<s1>} \addvspace{\<s2>} is equivalent to \addvspace{\<maximum of s1, s2>}.

\addvspace should be used only in vertical mode, and gives an error if it's not. The \addvspace command does *not* add vertical space if @minipage is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the \addpenalty{\<penalty>} command. It works properly when \addpenalty and \addvspace commands are mixed.

The @nobreak switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```

\addvspace{SKIP} ==
BEGIN
 if vmode
 then if @minipage

```

```

 else if \lastskip =0
 then \vskip SKIP
 else if \lastskip < SKIP
 then \vskip -\lastskip
 \vskip SKIP
 else if SKIP < 0 and \lastskip >= 0
 then \vskip -\lastskip
 \vskip \lastskip + SKIP
 fi fi fi fi
 else useful error message (CAR).
fi
END

```

\@xaddvskip Internal macro for \vspace handling the case that space has previously been added.

```

219 \def\@xaddvskip{%
220 \ifdim\lastskip<\@tempskipb
221 \vskip-\lastskip

### `\addpenalty`

```

270 〈/2ekernel〉
271 〈\latexrelease〉\IncludeInRelease{2015/01/01}%
272 〈\latexrelease〉 \addpenalty{\addpenalty}%
273 〈*2ekernel | latexrelease〉

```

Fix provided by Donald (though the original fix was not good enough). In 2005 Plamen Tanovski discovered that this fix wasn't good enough either as the `\vskip` kept getting bigger if several `\addpenalty` commands followed each other. Donald kindly send a new fix.

```

274 \def\addpenalty#1{%
275 \ifvmode
276 \if@minipage
277 \else
278 \if@nobreak
279 \else
280 \ifdim\lastskip=\z@
281 \penalty#1\relax
282 \else
283 \tempskipb\lastskip

```

We have to make sure the final `\vskip` seen by TeX is the correct one, namely `\tempskipb`. However we may have to adjust for `\prevdepth` when placing the penalty but that should not affect the skip we pass on to TeX.

```

284 \begingroup
285 \tempskipa\tempskipb
286 \advance \tempskipb
287 \ifdim\prevdepth>\maxdepth\maxdepth\else

```

If `\prevdepth` is -1000pt due to `\nointerlineskip` we better not add it!

```

288 \ifdim \prevdepth = -\@m\p@ \z@ \else \prevdepth \fi
289 \fi
290 \vskip -\tempskipb
291 \penalty#1%
292 \ifdim\tempskipa=\tempskipb

```

Do nothing if the `\prevdepth` check made no adjustment.

293               `\else`

Combine the prevdepth adjustment into a single skip.

294               `\advance\@tempskipb -\@tempskipa`  
295               `\vskip \@tempskipb`  
296               `\fi`

The final skip is always the specified length.

297               `\vskip \@tempskipa`

329 `(*2ekernel)`

(End definition for `\addpenalty`.)

`\vspace` The new code for these commands depends on the following facts:  
`\@vspace`  
`\@vspacer`

- The value of `prevdepth` is changed only when a box or rule is created and added to a vertical list;
- The value of `prevdepth` is used only when a box is created and added to a vertical list;
- The value of `prevdepth` is always local to the building of one vertical list.

330 `\DeclareRobustCommand\vspace{\@ifstar\@vspacer\@vspace}`

## 1.6 Horizontal space (and breaks)

`\nobreakdashes` This idea is borrowed from the `amsmath` package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as `-`, `--`, or `---`).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final `\nobreak`).

Note that even if it is not followed by a `'`, it still leaves vmode and sets the space-factor; so use it carefully!

```

406 \DeclareRobustCommand{\nobreakdashes}{%
407 \leavevmode
408 \toks@{\{}%
409 \def\reserved@a##1{\toks@\expandafter{\the\toks@-}%
410 \futurelet\@let@token \reserved@b}%
411 \def\reserved@b {\ifx\@let@token -%
412 \expandafter\reserved@a

```

```

413 \else
414 \setbox\z@ \hbox{\the\toks@\nobreak}%
415 \unhbox\z@
416 \spacefactor\sfcodes`-
417 \fi}%
418 \futurelet\@let@token \reserved@b
419 }

```

(End definition for `\nobreakdashes`.)

`\nobreakspace  
  \@xobeysp`

This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active `\~` to expand to it since this is the documented behaviour of `\~`. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the L<sup>A</sup>T<sub>E</sub>X internal commands.

The braces in the definition of `\~` are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep `\@xobeysp` as it is widely used; so here it is let to the non-robust command `\nobreakspace`.

```

420 \DeclareRobustCommand{\nobreakspace}{%
421 \leavevmode\nobreak\ }
422 \catcode`\~=13
423 \def~{\nobreakspace{}}
424 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname

```

(End definition for `\nobreakspace` and `\@xobeysp`.)

- Placed before a `\.`, makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

## ltlogos.dtx

### 1 Logos

Various logos are defined here.

- \TeX The \TeX logo, adjusted so that a full stop after the logo counts as ending a sentence.

```
1 <*2ekernel>
2 \DeclareRobustCommand{\TeX}{\kern-.1667em\lower.5ex\hbox{E}\kern-.125emX\@}
```

(End definition for \TeX.)

- \LaTeX The \LaTeX logo.

```
3 \DeclareRobustCommand{\LaTeX}{\kern-.36em%
4 {\sbox{z@T}%
5 \vbox to\ht{z@}{\hbox{\check@mathfonts
6 \fontsize{\sf@size}{\z@}
7 \math@fontsfalse\selectfont
8 A}%
9 \vss}%
10 }%
11 \kern-.15em%
12 \TeX}
```

(End definition for \LaTeX.)

- \LaTeXe The \LaTeX<sub>2ε</sub> logo as proposed by A-W designers.

```
13 \DeclareRobustCommand{\LaTeXe}{\mbox{\m@th
14 \if b\expandafter\@car\f@series\@nil\boldmath\fi
15 \LaTeX\kern.15em\textstyle\varepsilon\}}%
16 </2ekernel>
```

(End definition for \LaTeXe.)

# File r

## ltfiles.dtx

### 1 File Handling

The following user commands are defined in this part:

|                    |                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \document          | (ie \begin{document})                                                                                                                                                                       |
|                    | Reads in the .AUX files and \catcode's @ to 12.                                                                                                                                             |
| \nofiles           | Suppresses all file output by setting \@filesw false.                                                                                                                                       |
| \includeonly       | \{(NAME1, ... ,NAMEn)\}                                                                                                                                                                     |
|                    | Causes only parts NAME1, ... ,NAMEn to be read by their \include commands. Works by setting partsw true and setting \@partlist to NAME1, ... ,NAMEn.                                        |
| \include           | \{(NAME)\}                                                                                                                                                                                  |
|                    | Does an \input NAME unless \@partsw is true and NAME is not in \@partlist. If \@filesw is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.                 |
| \input             | \{(NAME)\}                                                                                                                                                                                  |
|                    | The same as TeX's \input, except it allows optional braces around the file name. In LATEX 2 <sub>E</sub> , it also avoids the primitive 'missing file' error, if the file can not be found. |
| \IfFileExists      | \{(NAME)\}\{(then)\}\{(else)\}                                                                                                                                                              |
|                    | If the file exists on the system, execute then otherwise execute else.                                                                                                                      |
| \InputIfFileExists | \{(NAME)\}\{(then)\}\{(else)\}                                                                                                                                                              |
|                    | If the file exists on the system, execute then and input NAME otherwise execute else.                                                                                                       |

\document
9 </2ekernel>
10 <latexrelease>\IncludeInRelease{2020/10/01}%
11 <latexrelease> {\document}{Added hook to load l3backend code}%
12 <2ekernel | latexrelease>
13 \def\document{%
```

We do cancel the grouping as part of the \begin handling (this is now done inside \begin instead) so that the env//<env>/begin hook is not hidden inside \begingroup ... \endgroup.

```
14 % \endgroup
15 \UseOneTimeHook{begindocument/before}-%
16 \@kernel@after@begindocument@before
```

Added hook to load l3backend code:

```
17 \ExplSyntaxOn
18 \ifx\@unusedoptionlist\empty\nothing
19 \WarningNoLine{Unused global option(s): ^J}%
20 \spaces{\@unusedoptionlist}-%
21 \fi
22 \colht\textheight
23 \colroom\textheight \vsize\textheight
24 \columnwidth\textwidth
25 \clubpenalty\clubpenalty
26 \if@twocolumn
27 \advance\columnwidth -\columnsep
```

```

28 \divide\columnwidth\tw@ \hsize\columnwidth \iffirstcolumntrue
29 \fi
30 \hsize\columnwidth \linewidth\hsize
31 \begingroup\@floatplacement\@dblfloatplacement
32 \makeatletter\let\@writefile\gobbletwo
33 \global \let \multiplelabels \relax
34 \cinput{\jobname.aux}%
35 \endgroup
36 \if@files
37 \immediate\openout\mainaux\jobname.aux
38 \immediate\write\mainaux{\relax}%
39 \fi

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old lfonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```

40 \process@table
41 \let\glb@currsize\empty % Force math initialization.

42 \normalsize
43 \everypar{}%

```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L<sup>A</sup>T<sub>E</sub>X2.0x and plain T<sub>E</sub>X.)

```

44 \ifx\normalsfcodes\empty
45 \ifnum\sfcodes`_=\@m
46 \let\normalsfcodes\frenchspacing
47 \else
48 \let\normalsfcodes\nonfrenchspacing
49 \fi
50 \fi

```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of `\language` at this point.

```

51 \ifx\document@default@\language\@ne
52 \chardef\document@default@\language\language
53 \fi

```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```

54 \@noskipsecfalse
55 \let \@refundefined \relax

```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```

56 \@kernel@before@begindocument
57 \UseOneTimeHook{begindocument}%
58 \@kernel@after@begindocument

```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts are group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn[]` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```

59 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
60 \global\@maxdepth\maxdepth
61 \global\let\@begindocumenthook\@undefined
62 \ifx\@listfiles\@undefined
63 \global\let\@filelist\relax
64 \global\let\@addtofilelist\@gobble
65 \fi

```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```

66 \gdef\do##1{\global\let ##1\@notprerr}%
67 \@preamblecmds

```

The next line saves tokens and also allows `\@nодокумент` to be used directly to trap preamble errors.

```
68 \global\let \@nодокумент \relax
```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```

69 \global\let\do\noexpand
70 \UseOneTimeHook{begindocument/end}%

```

Use of the hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

```
71 \ignorespaces}
```

The `begindocument` hook already existed in the kernel since 1994 under the name `\atbegindocumenthook` the additional ones are originally from the `etoolbox` package under the names `\@endpreamblehook` `\afterpreamble`.

```

72 \NewHook{begindocument}
73 \NewHook{begindocument/before}
74 \NewHook{begindocument/end}

```

Above we used two kernel only hooks to be run after the public `begindocument/before` and after `begindocument` hooks.

In `\@kernel@after@begindocument@before` we already place one action: drop the fast execution code for the `env/document/begin` hook. That hook marks the end of the preamble and should therefore only be run once. In a normal document that is anyway the case (so the code would just sit there taking up space afterwards, which these days is rather harmless), however, in more complicated scenarios where several full documents are combined to a single document it might get applied several times with harmful effects. We therefore explicitly drop it at this point. the coding is somewhat obscure due to the name of the macro which requires constructing.

```

75 \edef \@kernel@after@begindocument@before {%
76 \let\expandafter\noexpand\csname

```

```

77 __hook env/document/begin\endcsname
78 \noexpand\@empty}

```

(*End definition for \document and others.*)

- \normalsfcodes** The setting of \empty is just a flag. This command may be defined in a class or package file. If it is still \empty at \begin{document} it will be defined to be \frenchspacing or \nonfrenchspacing, depending on which of those appears to be in effect at that point.

```
197 \let\normalsfcodes\empty
```

(*End definition for \normalsfcodes.*)

- \nofiles** Set \filesfalse which suppresses the places where LATEX makes \immediate writes. The \makeindex and \makeglossary are disabled. \protected@write is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a *whatsit* node is still created, and so spacing is not affected by the \nofiles command; to ensure this more generally, the \ifnobreak test is needed.

```

198 \def\nofiles{%
199 \filesfalse
200 \typeout{No auxiliary output files.^J}%

215 }

```

(End definition for \protected@write.)

216 \let\@auxout=\@mainaux

\include In the definition of \include, \def\reserved@b changed to \edef\reserved@b to be  
\includeonly consistent with the \edef in \includeonly. (Suggested by Rainer Schöpf & Frank  
Mittelbach. Change made 20 Jul 88.)

Changed definition of \include to allow space at end of file name — otherwise,  
typing \include{foo } would cause L<sup>A</sup>T<sub>E</sub>X to overwrite foo.tex. Change made 24 May  
89, suggested by Rainer Schöpf and Frank Mittelbach

Made \include check for being used inside an \include'd file, as this will not work  
and cause surprising results.

```
217 〈/2ekernel〉
218 〈*2ekernel | latexrelease〉
219 〈latexrelease〉\IncludeInRelease{2020/10/01}%">
220 〈latexrelease〉\{\includeonly\}{Spaces in file names}%">

221 \def\include#1{\relax
222 \ifnum\@auxout=\@partaux
223 \@latex@error{\string\include\space cannot be nested}\@eha
224 \else
```

Here the normalization will add .tex for all files, (it uses the same normalization as the  
hooks), so we need to remove that manually. \@strip@tex@ext does that.

```
225 \set@curr@file{#1}%">
226 \edef\@curr@file{\@strip@tex@ext\@curr@file}%">

227 \expandafter\@include\expandafter{\@curr@file} % deliberate space
228 }
```

Here in \includeonly we also need to strip .tex after normalization:

```
229 \def\includeonly#1%
230 \@parts@true
```

Because the argument to \includeonly is a comma-separated list of filenames where  
there may be comma's preceding some of the filenames or trailing them. Therefore we  
need to take the list apart, remove the unwanted spaces while leaving the spaces *in* the  
filenames intact.

```
231 \let\@partlist\@empty
232 \@for\reserved@a:=#1 \do
233 {
234 \expandafter\set@curr@file\expandafter{\reserved@a}%">
235 \ifx\@partlist\@empty
236 \edef\@partlist{\@strip@tex@ext\@curr@file}%">
237 \else

239 \fi
240 }
241 }
242 \onlypreamble\includeonly
```

(End definition for \include and \includeonly.)

\@strip@tex@ext These macros take a (\detokenized file name and remove any .tex extension). Extra care is taken to not remove the string .tex from the middle of a file name: it is only removed if it's the very last thing in the file name.

```

```

(End definition for \@charlb and \@charrb.)

## 1.1 Safe Input Macros

\@curr@file File name handling is done by generating a csname from the provided file name (which means that UTF-8 octets gets turned into strings as this is what happens if they appear in a csname due to the code in `utf8.def`). By setting \escapchar to -1 we ensure that we don't get a backslash in front. As a result we end up with all characters as catcode 12 (plus spaces). We then sometimes add quotes around the construct (removing any existing inner quotes. Sometimes we only remove the quotes if they have been supplied by the user. There is clearly some room for improvement.

A side effect of the new code is that we will see quotes around file name displays where there haven't been any before.

For compatibility with existing code using `{abc}.tex` or `{one.two}.png`, an initial brace group is discarded before expansion and \string is applied. The content of the brace group is discarded. This means that a leading space will be lost unless protected (by { } or " " or \space) but filenames with a space are hopefully rare.

The definition below is from 2019 and only used during kernel bootstrapping, later on in `ltfilehook.dtx` it will get overwritten.

```

451 \def\set@curr@file#1{%
452 \begingroup

\IfFileExists@ Argument #1 is \@curr@file so catcode 12 string with no quotes.

The original definition picked up arguments #2 and #3 in a way that they couldn't contain unbalanced conditionals. A better implementation would have been not to pick up the arguments at all but instead use the usual \@firstoftwo and \secondoftwo. However, that changes how # is interpreted and so we can't do that nowadays without invalidating a lot of code. Therefore the somewhat curious construction near the end.

580 〈*2ekernel〉

```

**\InputIfFileExists** Now define `\InputIfFileExists` to input #1 if it seems to exist. Immediately prior to the input, #2 is executed. If the file #1 does not exist, execute '#3'.

This here is a temporary definition for the kernel. The real one comes somewhat later in the file `ltfilehook.dtx`.

```

581 \DeclareRobustCommand \InputIfFileExists[2]{%
582 \IfFileExists{#1}{%
583 {%
584 \expandafter\@swaptwoargs\expandafter
585 {\@filef@und}{#2\@addtofilelist{#1}\@@input}}}}

```

(*End definition for \InputIfFileExists.*)

**\@swaptwoargs** Swap two arguments and return them unbraced (like `\@firstoftwo` etc).

```

586 〈/2ekernel〉
587 〈*2ekernel | latexrelease〉
588 〈latexrelease〉\IncludeInRelease{2019/10/01}%
589 〈latexrelease〉 {\@swaptwoargs}{Don't lose the file name}%
590 \long\def\@swaptwoargs#1#2{#2#1}

591 〈/2ekernel | latexrelease〉
592 〈latexrelease〉\EndIncludeInRelease
593 〈latexrelease〉\IncludeInRelease{0000/00/00}%
594 〈latexrelease〉 {\@swaptwoargs}{Don't lose the file name}%
595 〈latexrelease〉\let\@swaptwoargs\undefined
596 〈latexrelease〉\EndIncludeInRelease
597 〈*2ekernel〉

```

(*End definition for \@swaptwoargs.*)

**\input** Input a file: if the argument is given in braces use safe input macros, otherwise use  $\text{\TeX}$ 's primitive `\input` command (which is called `\@@input` in  $\text{\LaTeX}$ ).

```
598 \def\input{\@ifnextchar\bgroup\@iinput\@@input}
```

(*End definition for \input.*)

**\@iinput** Define `\@iinput` (i.e., `\input`) in terms of `\InputIfFileExists`.

Changes to `\@iinput`: adapt to the changes to `\@missingfileerror`.

```

599 〈/2ekernel〉
600 〈*2ekernel | latexrelease〉
601 〈latexrelease〉\IncludeInRelease{2020/10/01}%
602 〈latexrelease〉 {\@iinput}{Change in file error handling}%
603 \def\@iinput#1{%

636 <*2ekernel>
```

(End definition for `\@iinput`.)

`\@input` Define `\@input` in terms of `\IfFileExists`. So this is a ‘safe input’ command, but the files input are not listed by `\listfiles`.

We don’t want `.aux`, `.toc` files etc be listed by `\listfiles`. However, something like `.bb1` probably should be listed and thus should be implemented not by `\@input`.

```

637 \def\@input#1{%
638 \IfFileExists{#1}{\@input\@filef@und}{\typeout{No file #1.}}}
```

(End definition for `\@input`.)

`\@input@` Version of `\@input` that does add the file to `\@filelist`.

```

639 \def\@input@#1{\InputIfFileExists{#1}{}{\typeout{No file #1.}}}
```

(End definition for `\@input@`.)

`\@missingfileerror` This ‘error’ command avoids TeX’s primitive missing file loop.

Missing file error. Prompt for a new filename, offering a default extension.

Changes to `\@missingfileerror`: rather than trying to input the file by force, now `\@missingfileerror` just returns three `\@missingfile@<part>` and the caller macro is responsible for doing the right thing with it.

```

734   \typeout{ *****^J}}}
```

The \@filelist will be de-activated if \listfiles does not appear in the preamble. \begin{document} contains code equivalent to the following:

```
\AtBeginDocument{%
  \ifx\@listfiles\undefined
    \let\@filelist\relax
    \let\@addtofilelist\@gobble
  \fi}

 735 \onlypreamble\listfiles
```

```
\@dofilelist 736 \let\@dofilelist\relax
 737 </2ekernel>
```

(End definition for \obsoletefile and others.)

File s

ltoutenc.dtx

1 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OML, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {t1enc.def}
\input {ot1enc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{\command}{{\encoding}}
[{\number} [{\default}]] {{\commands}}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{{\@xxxii 1}}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{\command}{{\encoding}}
[{\number} [{\default}]] {{\commands}}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{\command}{{\encoding}}{\slot}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{\command}{{\encoding}}{\slot}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{<command>}
{<encoding>}{<argument>}{<slot>}
```

This command declares a composite letter, for example in the T1 encoding '\{a} is slot 225, which is declared by:

```
\DeclareTextComposite{'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{<command>}
{<encoding>}{<argument>}{<text>}
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@\ht\z@\advance\dimen@-1ex%
\rlap{\raise.67\dimen\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{<encoding>}{<command>}
```

For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{<encoding>}{<command>}{<text>}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{'}{a}` has the same effect as:

```
{\fontencoding{OT1}\selectfont'\{\fontencoding{OT2}\selectfont a\}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{\command}{\definition}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction $\frac{1}{4}$) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\Provide` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{\command}{\definition}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{\command}{\encoding}
\DeclareTextAccentDefault{\command}{\encoding}
```

are short for:

```
\DeclareTextCommandDefault{\command}
  {\UseTextSymbol{\encoding}{\command}}
\DeclareTextCommandDefault[1]{\command}
  {\UseTextAccent{\encoding}{\command}#1}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

1.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since \$ and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flaky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L^AT_EX will still find the encoding specific definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L^AT_EX to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar} {T1}
\DeclareTextCommandDefault{\textdollar}
  {\UseTextSymbol{TS1}\textdollaroldstyle}
```

1.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

1.3 Docstrip modules

This .dtx file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

T1	generates <code>t1enc.def</code> for the Cork encoding.
TS1	generates <code>ts1enc.def</code> for the Text Companion encoding.
TS1sty	generates <code>textcomp.sty</code> , package that sets up use of the Text Companion encoding.
OT1	generates <code>ot1enc.def</code> for Knuth's CM encoding.
OMS	generates <code>omsenc.def</code> for Knuth's math symbol encoding.
OML	generates <code>omlenc.def</code> for Knuth's math letters encoding.
OT4	generates <code>ot4enc.def</code> for the Polish extension to the OT1 encoding, created by B. Jackowski and M. Ry��ko for use with the Polish version of Computer Modern and Computer Concrete.
TU	generates <code>tuenc.def</code> for Unicode font encoding.
package	generates <code>fontenc.sty</code> for selecting encodings.
2ekernel	for the kernel commands.

1.4 Definitions for the kernel

1.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in `.def` files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1  {*2ekernel}
2  \message{font encodings,}
```

Far too many macros in one block here!

```
\DeclareTextCommand
\ProvideTextCommand
\DeclareTextSymbol
  @dec@text@cmd
\chardef@text@cmd
  @changed@cmd
  @changed@x
\TextSymbolUnavailable
  @inmathwarn
```

If you say:

```
\DeclareTextCommand{\foo}{T1}...
```

then `\foo` is defined to be `\T1-cmd \foo \T1\foo`, where `\T1\foo` is *one* control sequence, not two! We then call `\newcommand` to define `\T1\foo`.

```
3  \def\DeclareTextCommand{%
4    @dec@text@cmd\newcommand}
5  \def\ProvideTextCommand{%
6    @dec@text@cmd\providecommand}
7  \def@dec@text@cmd#1#2#3{%
8    \expandafter\def\expandafter#2%
9      \expandafter{%
10        \csname#3-cmd\expandafter\endcsname
11        \expandafter#2%
12        \csname#3\string#2\endcsname
13      }%
14  \let@\ifdefinable\@rc@\ifdefinable
15  \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `@dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providecommand` (used just above) both handle the resetting of `\ifdefinable` (following its disabling in `@dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17   \let@\ifdefinable\@rc@\ifdefinable
18   \chardef
19 }
20 \def\DeclareTextSymbol#1#2#3{%
21   @dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22 }
```

The declarations are only available before `\begin{document}`.

```
23 \onlypreamble\DeclareTextCommand
24 \onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is T1, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like `X_\copyright` work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `\?\foo` if it is defined, and an error message otherwise.

When the encoding is changed from T1 to OT1, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

25 \def\@current@cmd#1{%
26   \ifx\protect\@typeset@protect
27     \cinmathwarn#1%
28   \else
29     \noexpand#1\expandafter\@gobble
30   \fi}

31 \def\@changed@cmd#1#2{%
32   \ifx\protect\@typeset@protect
33     \cinmathwarn#1%
34     \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
35       \expandafter\ifx\csname ?\string#1\endcsname\relax
36         \expandafter\def\csname ?\string#1\endcsname{%
37           \TextSymbolUnavailable#1%
38         }%
39       \fi
40     \global\expandafter\let
41       \csname\cf@encoding\string#1\expandafter\endcsname
42       \csname ?\string#1\endcsname
43     \fi
44     \csname\cf@encoding\string#1%
45       \expandafter\endcsname
46   \else
47     \noexpand#1%
48   \fi}

49 \gdef\TextSymbolUnavailable#1{%
50   \@latex@error{%
51     Command \protect#1 unavailable in encoding \cf@encoding%
52   }\@eha}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `\halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```
53 \def\@inmathwarn#1{%
54   \ifmmode
55     \@latex@warning{Command \protect#1 invalid in math mode}%
56   \fi}
```

(End definition for `\DeclareTextCommand` and others.)

`\DeclareTextCommandDefault`
`\ProvideTextCommandDefault`

These define commands with encoding ?.

Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```
57 \def\DeclareTextCommandDefault#1{%
58   \DeclareTextCommand#1?}

59 \def\ProvideTextCommandDefault#1{%
60   \ProvideTextCommand#1?}

61 \@onlypreamble\DeclareTextCommandDefault
62 %\@onlypreamble\ProvideTextCommandDefault
```

They require `\?-cmd` to be initialized as `\@changed@cmd`.

```
63 \expandafter\let\csname?-cmd\endcsname\@changed@cmd
```

(End definition for `\DeclareTextCommandDefault` and `\ProvideTextCommandDefault`.)

`\DeclareTextAccent`

This is just a disguise for defining a TeX `\accent` command.

```
64 \def\DeclareTextAccent#1#2#3{%
65   \DeclareTextCommand#1{#2}{\add@accent{#3}}}

66 \@onlypreamble\DeclareTextAccent
```

(End definition for `\DeclareTextAccent`.)

`\add@accent`

To save space this code is shared between all text accents that are set using the `\accent` primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve `\setbox` operations which also inhibit the mechanism of the `\accent` primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

```
67 \def\add@accent#1#2{\hmode@\bgroup}
```

Turn off the group in `\UseTextSymbol` in case this is used inside the argument of `\add@accent`.

```
68   \let\hmode@start@before@group\@firstofone
69   \setbox\@tempboxa\hbox{\#2%
```

When presetting the argument in a box we record its `\spacefactor` for later use after the accent got typeset. This way something like `\`A` gets the spacefactor of `A` (i.e., 999) rather than the default value of 1000.

```
70   \global\mathchardef\accent@spacefactor\spacefactor}%
```

The accent primitive doesn't allow things `\begingroup` to interfere between accent and base character. Therefore we need to avoid that (they are some hidden inside `\maybe@load@fontshape`). As we don't have to load the fontshape in this case (as that happened in the box above if necessary, we simply disable that part of the code temporarily. We also ignore `\ignorespaces` which has the same issue and may show up as part of `\normalfont` if that is used.

```
71   \let\maybe@load@fontshape\relax
72   \let\ignorespaces\relax
73   \accent#1 #2\egroup\ifmmode\else\spacefactor\accent@spacefactor\fi}
```

Default definition for `\accent@spacefactor` prevents a horrible death of the above macro inside an unprotected `\edef`.

```
74 \let\accent@spacefactor\relax
```

(End definition for `\add@accent`.)

```
\hmode@bgroup
75 \def\hmode@bgroup{\leavevmode\bgroup}
```

(End definition for `\hmode@bgroup`.)

```
\DeclareTextCompositeCommand
  \DeclareTextComposite
    \text@composite
    \text@composite@x
      \strip@args
```

Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `\text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
#1 -> \text@composite \T1\foo #1\empty \text@composite {...}
```

where `...` is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```

144 <latexrelease>\EndIncludeInRelease
145

146 <*2ekernel>

This all works because:

```
\@text@composite \T1\foo A\@empty \@text@composite {...}
```

expands to `\T1\foo-A` if `\T1\foo-A` has been defined, and `\{\dots\}` otherwise.

Note that `\@text@composite` grabs the first token of the argument and puts just that in the csname. This is so that `\'{\textit{e}}` will work—it checks whether `\T1\'-\textit{e}` is defined (which presumably it isn't) and so expands to `\{accent 1 \textit{e}\}`.

This trick won't always work, for example `\'{{\itshape e}}` will expand to (with spaces added for clarity):

```
\csname \string \T1\` - \string {\itshape e} \empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use \csname lookups as a fast way of accessing composites.

This has an unfortunate ‘misfeature’ though, which is that in the T1 encoding, `\'{aa}` produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn’t affect performance too badly.

Finally, it's worth noting that the `\@empty` is used in `\@text@composite` so that accents will work even when the argument is empty. If you say `\'{}{}` then this looks up `\\"{}T1\'{} - \string \endcsname`, which ought to be `\relax`, and so all is well. If we didn't include the `\@empty`, then `\'{}{}` would expand to:

```
\csname \string \T1\'{} - \string \endcsname
```

so the `\endcsname` would be `\string`'ed and the whole of the rest of the document would be put inside the `\csname`. This would not be good.

```
126 \def\@text@composite#1#2#3\@text@composite{%
127   \expandafter\@text@composite@x
128   \csname\string#1-\string#2\endcsname}
```

Originally the `\@text@composite@x` macro had two arguments and if #1 was not `\relax` it was executed, otherwise #2 was executed. All this happened within the `\ifx` code so that neither #1 nor #2 could have picked up any additional arguments from the input stream. This has now been changed using the typical `\@firstoftwo / \@secondoftwo` coding. This way the final expansion will happen without any `\else` or `\fi` intervening in the case that we need to get a further token from the input stream.

```
129 \def\@text@composite@x#1{%
130   \ifx#1\relax
131     \expandafter\@secondoftwo
132   \else
133     \expandafter\@firstoftwo
134   \fi
135   #1}
```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```
136 \catcode\z@=11\relax
137 \def\DeclareTextComposite#1#2#3#4{%
138   \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
139   \bgroup
140     \lccode\z@#4%
141     \lowercase{%
142       \egroup
143       \reserved@a ^^@}}
144 \catcode\z@=15\relax
145 \onlypreamble\DeclareTextComposite
```

(End definition for `\DeclareTextCompositeCommand` and others.)

```
146 </2ekernel>
147 (*2ekernel | latexrelease)
148 (latexrelease)\IncludeInRelease{2019/10/01}%
149 (latexrelease)           {\UseTextAccent}{Make commands robust}%
```

`\UseTextAccent` These fragile commands access glyphs from different encodings. They use grotty low-level calls to the font selection scheme for speed, and in order to make sure that `\UseTextSymbol` doesn't do anything which you're not allowed to do between an `\accent` and its glyph.

For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

```

150 \DeclareRobustCommand*\UseTextAccent[3]{%
151   \hmode@start@before@group
152   {%

181   \pickup@font
182   \font@name
183   \@@enc@update}%

```

(End definition for \UseTextAccent, \UseTextSymbol, and \@use@text@encoding.)

\hmode@start@before@group The \hmode@start@before@group starts hmode and should be immediately followed by an explicit \{...\}. Its purpose is to ensure that hmode is started before this group is opened. Inside \add@accent and \UseTextAccent it is redefined to remove this group so that it doesn't conflict with the \accent primitive.

For a detailed discussion see pr/3160.

```

184 \let\hmode@start@before@group\leavevmode

```

(End definition for \hmode@start@before@group.)

\DeclareTextSymbolDefault	Some syntactic sugar. Again, these should probably be optimized for speed.
\DeclareTextAccentDefault	<pre> 185 \def\DeclareTextSymbolDefault#1#2{% 186 \DeclareTextCommandDefault#1{\UseTextSymbol{#2}{#1}}% 187 \def\DeclareTextAccentDefault#1#2{% 188 \DeclareTextCommandDefault#1{\UseTextAccent{#2}{#1}}% 189 \onlypreamble\DeclareTextSymbolDefault 190 \onlypreamble\DeclareTextAccentDefault </pre> <p>(End definition for <code>\DeclareTextSymbolDefault</code> and <code>\DeclareTextAccentDefault</code>.)</p>
\UndeclareTextCommand	<p>This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.</p> <pre> 191 \def\UndeclareTextCommand#1#2{% </pre> <p>If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without eTeX we can't do anything about that).</p> <pre> 192 \expandafter\ifx\csname#2\string#1\endcsname\relax 193 \else </pre> <p>Else: throw away that declaration.</p> <pre> 194 \global\expandafter\let\csname#2\string#1\endcsname 195 \undefined </pre> <p>But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command <code>\foo</code> would look similar to <code>\T1-cmd \foo \T1\foo</code> (three tokens).</p> <p>Of course, instead of <code>\T1</code> one could see a different encoding name; which one depends the encoding for which <code>\foo</code> was declared last.</p> <p>Now assume we have just removed the declaration for <code>\foo</code> in <code>\T1</code> and the top-level of <code>\foo</code> expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset <code>\foo</code> within <code>\T1</code> instead of getting the default definition for <code>\foo</code>. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by <code>?</code>.</p> <p>Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like <code>\?-cmd \foo \?\foo</code> which is done by the following (readable?) code:</p> <pre> 196 \expandafter\expandafter\expandafter 197 \ifx\expandafter\@thirdofthree#1\@undefined 198 \expandafter\gdef\expandafter#1\expandafter 199 {\csname ?-cmd\expandafter\endcsname\expandafter 200 #1\csname?\string#1\endcsname}% 201 \fi 202 \fi 203 } </pre> <pre> 204 \onlypreamble\UndeclareTextCommand </pre> <p>(End definition for <code>\UndeclareTextCommand</code>.)</p>

1.4.2 Hyphenation

```

(End definition for `\patterns` and others.)

1.4.3 Miscellania

- \a The `\a` command is used to access the accent commands even when they have been redefined (for example by the `tabbing` environment). Its internal name is `\@tabacckludge`.
The `\string` within the `\csname` guards against something like ' being active at the point of use.

```
223 \\def\\@tabacckludge#1{\\expandafter\\@changed@cmd
224                                     \\csname\\string#1\\endcsname\\relax}
225 \\let\\a=\\@tabacckludge
```

(End definition for `\a`.)

1.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like `\ae` and `\ss`) or by the TeX Users Group Technical Working Group on multi-lingual typesetting (like `\th` and `\ng`) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like `\guillemotleft` and `\quotedblbase`). Unfortunately, this naming scheme won't work for all glyphs, since some names (like `\space`) are already used, and some (like `\endash`) are very likely to be defined by users. So we're now using the naming scheme of `\text` followed by the Adobe name, (like `\textendash` and `\textsterling`). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like `\textcompwordmark`). Sigh.

Some accents from OT1:

```
226 \DeclareTextAccentDefault{\\"}{OT1}
227 \DeclareTextAccentDefault{\'}{OT1}
228 \DeclareTextAccentDefault{\.{}}{OT1}
229 \DeclareTextAccentDefault{\=}{OT1}
230 \DeclareTextAccentDefault{\H}{OT1}
231 \DeclareTextAccentDefault{\^}{OT1}
232 \DeclareTextAccentDefault{\`}{OT1}
233 \DeclareTextAccentDefault{\b}{OT1}
234 \DeclareTextAccentDefault{\c}{OT1}
235 \DeclareTextAccentDefault{\d}{OT1}
236 \DeclareTextAccentDefault{\r}{OT1}
237 \DeclareTextAccentDefault{\u}{OT1}
238 \DeclareTextAccentDefault{\v}{OT1}
239 \DeclareTextAccentDefault{\~}{OT1}
```

Some symbols from OT1:

266 \DeclareTextSymbolDefault{\textsterling}{OT1}
```

Some symbols from OMS:

```
267 \DeclareTextSymbolDefault{\textasteriskcentered}{OMS}
268 \DeclareTextSymbolDefault{\textbackslash}{OMS}
269 \DeclareTextSymbolDefault{\textbar}{OMS}
270 \DeclareTextSymbolDefault{\textbardbl}{OMS}
271 \DeclareTextSymbolDefault{\textbraceleft}{OMS}
272 \DeclareTextSymbolDefault{\textbraceright}{OMS}
273 \DeclareTextSymbolDefault{\textbullet}{OMS}
```

```

274 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
275 \DeclareTextSymbolDefault{\textdagger}{OMS}
276 \DeclareTextSymbolDefault{\textparagraph}{OMS}
277 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
278 \DeclareTextSymbolDefault{\textsection}{OMS}
279 \DeclareTextAccentDefault{\textcircled}{OMS}

```

Some symbols from OML:

```

280 \DeclareTextSymbolDefault{\textless}{OML}
281 \DeclareTextSymbolDefault{\textgreater}{OML}
282 \DeclareTextAccentDefault{\t}{OML}

```

Some defaults we can fake.

The interface for defining \copyright changed, it used to use `\expandafter` to add braces at the appropriate points.

```

283 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
284 % \expandafter\def\expandafter
285 %           \copyright\expandafter{\expandafter{\copyright}}
286 \DeclareTextCommandDefault{\textasciicircum}{\^{}}
287 \DeclareTextCommandDefault{\textasciitilde}{\~{}}
288 \DeclareTextCommandDefault{\textunderscore}{%
289   \leavevmode \kern.06em\vbox{\hrule\@width.3em}}

```

There is no good reason anymore to fake `\textcompwordmark`.

```

290 \% \DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
291 \DeclareTextSymbolDefault{\textcompwordmark}{T1}
292 \DeclareTextCommandDefault{\textvisiblespace}{%
293   \mbox{\kern.06em\vrule\@height.3ex}%
294   \vbox{\hrule\@width.3em}%
295   \hbox{\vrule\@height.3ex}}

```

Using `\fontdimen3` in the next definition is some sort of a kludge (since it is the interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since there it is zero).

```

296 \DeclareTextCommandDefault{\textellipsis}{%
297   .\kern\fontdimen3\font
298   .\kern\fontdimen3\font
299   .\kern\fontdimen3\font}
300 \% \DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
301 \DeclareTextCommandDefault{\textregistered}{\textcircled{%
302   \check@mathfonts\fontsize\sf@size\z@\math@fontsfalse\selectfont R}}
303 \DeclareTextCommandDefault{\texttrademark}{\textsuperscript{TM}}

306 \DeclareTextCommandDefault{\textordmasculine}{\textsuperscript{o}}

```

1.4.5 Math material

Some commands can be used in both text and math mode:

```
307 \DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textrm{\$}\fi}
```

We use `\protected` not `\DeclareRobustCommand` so that `\bigl\{` etc. works inside `\protected@edef`.

```
308 \protected\def\{{\ifmmode\lbrace\else\textrm{\{}fi\}}
309 \protected\def\}{\ifmmode\rbrace\else\textrm{\}}fi\}
310 \DeclareRobustCommand{\P}{\ifmmode\mathparagraph\else\textrm{\P}\fi}
311 \DeclareRobustCommand{\S}{\ifmmode\mathsection\else\textrm{\S}\fi}
312 \DeclareRobustCommand{\dag}{\ifmmode\dagger\else\textrm{\dag}\fi}
313 \DeclareRobustCommand{\ddag}{\ifmmode\ddagger\else\textrm{\ddagger}\fi}
```

For historical reasons `\copyright` needs {} around the definition in maths.

```
314 \DeclareRobustCommand{\_}{%
315   \ifmmode\nfss@text{\textunderscore}\else\textrm{\_}\fi}
316 \DeclareRobustCommand{\copyright}{%
317   \ifmmode{\nfss@text{\textcopyright}}\else\textrm{\copyright}\fi}
318 \DeclareRobustCommand{\pounds}{%
319   \ifmmode\mathsterling\else\textrm{\pounds}\fi}
320 \DeclareRobustCommand{\dots}{%
321   \ifmmode\mathellipsis\else\textrm{\dots}\fi}
322 \let\ldots\dots
```

Default definition of the commabelow accent.

```

1.5 Definitions for the OT1 encoding

The definitions for the ‘TEX text’ (OT1) encoding.

Declare the encoding.

```

376  {*OT1}
377  \DeclareFontEncoding{OT1}{}{}

```

Declare the accents.

```

378  \DeclareTextAccent{"}{OT1}{127}
379  \DeclareTextAccent{'}{OT1}{19}
380  \DeclareTextAccent{.}{OT1}{95}
381  \DeclareTextAccent{=}{OT1}{22}
382  \DeclareTextAccent{^}{OT1}{94}
383  \DeclareTextAccent{`}{OT1}{18}
384  \DeclareTextAccent{~-}{OT1}{126}
385  \DeclareTextAccent{H}{OT1}{125}
386  \DeclareTextAccent{u}{OT1}{21}
387  \DeclareTextAccent{v}{OT1}{20}
388  \DeclareTextAccent{r}{OT1}{23}

```

Some accents have to be built by hand: Note that `\oalign` and `\o@align` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from plain.tex since that now has two incompatible definitions.

```

389  \DeclareTextCommand{\b}{OT1}[1]
390    {\hmode@bgroup\o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}}%

```

```

391      \vbox to .2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
392 \DeclareTextCommand{\c}{OT1}[1]
393   {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent24 #1%
394   \else{\ooalign{\unhbox\z@\crcr\hidewidth\char24\hidewidth}}\fi}
395 \DeclareTextCommand{\d}{OT1}[1]
396   {\hmode@bgroup
397   \o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}. \hidewidth}\egroup}

```

Declare the text symbols.

```

398 \DeclareTextSymbol{\AE}{OT1}{29}
399 \DeclareTextSymbol{\OE}{OT1}{30}
400 \DeclareTextSymbol{\O}{OT1}{31}
401 \DeclareTextSymbol{\ae}{OT1}{26}
402 \DeclareTextSymbol{\i}{OT1}{16}
403 \DeclareTextSymbol{\j}{OT1}{17}
404 \DeclareTextSymbol{\oe}{OT1}{27}
405 \DeclareTextSymbol{\o}{OT1}{28}
406 \DeclareTextSymbol{\ss}{OT1}{25}
407 \DeclareTextSymbol{\textemdash}{OT1}{124}
408 \DeclareTextSymbol{\textendash}{OT1}{123}

```

The `\nobreak\hspace{z@}` is there to prevent a break after the hyphen but allow later breaks in the remainder of the word.

```

409 \DeclareTextCommand{\textnonbreakinghyphen}{OT1}{\mbox{-}\nobreak\hspace{z@}}
410 \DeclareTextCommand{\textfiguredash} {OT1}{\textendash}
411 \DeclareTextCommand{\texthorizontalbar} {OT1}{\textemdash}

```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```

412 %\DeclareTextSymbol{\textexclamdown}{OT1}{60}
413 %\DeclareTextSymbol{\textquestiondown}{OT1}{62}
414 \DeclareTextCommand{\textexclamdown}{OT1}{!`}
415 \DeclareTextCommand{\textquestiondown}{OT1}{?`}
416 %\DeclareTextSymbol{\texthyphenchar}{OT1}{`-}
417 %\DeclareTextSymbol{\texthyphen}{OT1}{`-}
418 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
419 \DeclareTextSymbol{\textquotedblright}{OT1}{`}
420 \DeclareTextSymbol{\textquotelleft}{OT1}{`}
421 \DeclareTextSymbol{\textquoteright}{OT1}{`}

```

Some symbols which are faked from others:

```

422 % \DeclareTextCommand{\aa}{OT1}
423 %   {{\accent23a}}
424 \DeclareTextCommand{\L}{OT1}
425   {\leavevmode\setbox\z@\hbox{L}\hb@xt@wd\z@{\hss@xxxii L}}
426 \DeclareTextCommand{\l}{OT1}
427   {\hmode@bgroup\@xxxii l\egroup}
428 % \DeclareTextCommand{\AA}{OT1}
429 %   {\leavevmode\setbox\z@\hbox{h}\dimen@ht\z@\advance\dimen@-1ex%
430 %     \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

In the OT1 encoding Å has a hand-crafted definition, so we have here the first recorded explicit use of `\DeclareTextCompositeCommand`.

```

431 \DeclareTextCompositeCommand{\r}{OT1}{A}
432   {\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
433   \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```

434 \DeclareTextCommand{\ij}{OT1}{%
435   \nobreak\hskip\z@skip i\kern-0.02em\nobreak\hskip\z@skip j}
436 \DeclareTextCommand{\IJ}{OT1}{%
437   \nobreak\hskip\z@skip I\kern-0.02em\nobreak\hskip\z@skip J}

```

In the OT1 encoding, £ and \$ share a slot.

```

438 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
439   \ifdim \fontdimen\@ne\font >\z@
440     \slshape
441   \else
442     \upshape
443   \fi
444   \char`\$\egroup}
445 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
446   \ifdim \fontdimen\@ne\font >\z@
447     \itshape
448   \else
449     \fontshape{ui}\selectfont
450   \fi
451   \char`\$\egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true L^AT_EX internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

452 \DeclareTextComposite{\.}{OT1}{i}{`i}
453 \DeclareTextComposite{\.}{OT1}{i}{`i}
454 \DeclareTextCompositeCommand{\`}{OT1}{i}{\@tabacckludge`i}
455 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge'i}
456 \DeclareTextCompositeCommand{\^}{OT1}{i}{^\i}
457 \DeclareTextCompositeCommand{\"}{OT1}{i}{\"i}

```

T1 encoding is given more extensive set of overloads for \c. But here we just adjust \c{g}.

```

458 \ifx\textcommaabove\undefined\else
459 \DeclareTextCompositeCommand{\c}{OT1}{g}{\textcommaabove{g}}
460 \fi
461 
```

1.6 Definitions for the T1 encoding

The definitions for the ‘Extended T_EX text’ (T1) encoding.

Declare the encoding.

```

462 <*T1>
463 \DeclareFontEncoding{T1}{}{}

```

Declare the accents.

```

464 \DeclareTextAccent{\`}{T1}{0}
465 \DeclareTextAccent{\'}{T1}{1}
466 \DeclareTextAccent{\^}{T1}{2}

```

```

467 \DeclareTextAccent{\~}{T1}{3}
468 \DeclareTextAccent{\"}{T1}{4}
469 \DeclareTextAccent{\H}{T1}{5}
470 \DeclareTextAccent{\r}{T1}{6}
471 \DeclareTextAccent{\v}{T1}{7}
472 \DeclareTextAccent{\u}{T1}{8}
473 \DeclareTextAccent{\=}{T1}{9}
474 \DeclareTextAccent{\.}{T1}{10}

```

Some accents have to be built by hand. Note that `\o@align` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from plain.tex since that now has two incompatible definitions.

```

475 \DeclareTextCommand{\b}{T1}[1]
476   {\hmode@bgroup\o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
477     \vbox to .2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
478 \DeclareTextCommand{\c}{T1}[1]
479   {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent11 #1%
480     \else\o@align{\unhbox\z@\crcr
481       \hidewidth\char11\hidewidth}\fi}
482 \DeclareTextCommand{\d}{T1}[1]
483   {\hmode@bgroup
484     \o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
485 \DeclareTextCommand{\k}{T1}[1]
486   {\hmode@bgroup\o@align{\null\#1\crcr\hidewidth\char12}\egroup}
487 \DeclareTextCommand{\textogonekcentered}{T1}[1]
488   {\hmode@bgroup\o@align{%
489     \null\#1\crcr\hidewidth\char12\hidewidth}\egroup}

```

Some symbols are constructed.

Slot 24 contains a small circle intended for construction of these two glyphs.

```

490 \DeclareTextCommand{\textperthousand}{T1}
491   {\%\char 24 } % space or 'relax as delimiter?
492 \DeclareTextCommand{\textpertenthousand}{T1}
493   {\%\char 24\char 24 } % space or 'relax as delimiter?

```

For Maltese, `\Hwithstroke` and `\hwithstroke` are needed.

```

494 \DeclareTextCommand{\Hwithstroke}{T1}
495   {%
496     \hmode@bgroup
497     \vphantom{H}%
498     \sbox\z@{H}%
499     \o@align{%
500       H\cr
501       \hidewidth
502       \vrule
503         height \dimexpr 0.7\ht\z@+0.1ex\relax
504         depth -0.7\ht\z@
505         width 0.8\wd\z@
506       \hidewidth\cr
507     }%
508     \egroup
509   }
510 \DeclareTextCommand{\hwithstroke}{T1}
511   {%

```

```

512     \hmode@bgroup
513     \vphantom{h}%
514     \sbox{z@{h}}%
515     \ooalign{%
516         h\cr
517         \kern0.075\wd{z@}
518         \vrule
519             height \dimexpr 0.7\ht{z@}+0.1ex\relax
520             depth -0.7\ht{z@}
521             width 0.4\wd{z@}
522             \hidewidth\cr
523     }%
524     \egroup
525 }
```

Declare the text symbols.

```

733     \char 13 % "0D

```

```

734   }%
735   \egroup}
736 
```

1.8 Definitions for the OML encoding

The definitions for the ‘ \TeX math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard \LaTeX text symbols.

Declare the encoding.

```

737 <*OML>
738 \DeclareFontEncoding{OML}{}{}

```

Declare the symbols.

```

739 \DeclareTextSymbol{\textless}{OML}{`<}
740 \DeclareTextSymbol{\textgreater}{OML}{`>}
741 \DeclareTextAccent{\t}{OML}{127} % "7F
742 
```

1.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘ \TeX text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The \LaTeX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources <ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip>;

Font files <ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip>.

Declare the encoding.

```

743 <*OT4>
744 \DeclareFontEncoding{OT4}{}{}
745 \DeclareFontSubstitution{OT4}{cmr}{m}{n}

```

Declare the accents.

```

746 \DeclareTextAccent{\"}{OT4}{127}
747 \DeclareTextAccent{\'}{OT4}{19}
748 \DeclareTextAccent{\.}{OT4}{95}
749 \DeclareTextAccent{\=}{OT4}{22}
750 \DeclareTextAccent{\^}{OT4}{94}
751 \DeclareTextAccent{\`}{OT4}{18}
752 \DeclareTextAccent{\~}{OT4}{126}
753 \DeclareTextAccent{\H}{OT4}{125}
754 \DeclareTextAccent{\u}{OT4}{21}
755 \DeclareTextAccent{\v}{OT4}{20}
756 \DeclareTextAccent{\r}{OT4}{23}

```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```

757 \DeclareTextCommand{\k}{OT4}[1]{%
758   \TextSymbolUnavailable{\k{#1}}#1}

```

In these definitions we no longer use the helper function `\sh@ft` from plain.tex since that now has two incompatible definitions.

```

759 \DeclareTextCommand{\b}{OT4}[1]
760   {\hmode@bgroup\o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
761     \vbox to .2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
762 \DeclareTextCommand{\c}{OT4}[1]
763   {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent24 #1%
764     \else\ooalign{\unhbox\z@\crcr\hidewidth\char24\hidewidth}\fi}
765 \DeclareTextCommand{\d}{OT4}[1]
766   {\hmode@bgroup
767     \o@align{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
```

Declare the text symbols.

```

768 \DeclareTextSymbol{\AE}{OT4}{29}
769 \DeclareTextSymbol{\OE}{OT4}{30}
770 \DeclareTextSymbol{\O}{OT4}{31}

1.10 Definitions for the TS1 encoding

```

829 <*TS1>
830 \DeclareFontEncoding{TS1}{}{}
831 \DeclareFontSubstitution{TS1}{cmr}{m}{n}

```

Some accents have to be built by hand. Note that \ooalign and \o@lign must be inside a group.

```

832 \DeclareTextCommand{\capitalcedilla}{TS1}[1]
833   {\hmode@bgroup
834   \ooalign{\null#1\crcr\hidewidth\char11\hidewidth}\egroup}
835 \DeclareTextCommand{\capitalogonek}{TS1}[1]
836   {\hmode@bgroup
837   \ooalign{\null#1\crcr\hidewidth\char12\hidewidth}\egroup}

```

Accents for capital letters.

These commands can be used by the end user either directly or through definitions of the type

```
\DeclareTextCompositeCommand{\'}{T1}{X}{\capitalacute X}
```

None of the latter definitions are provided by default, since they are probably rarely used.

```

"00 = 0
838 \DeclareTextAccent{\capitalgrave}{TS1}{0}
839 \DeclareTextAccent{\capitalacute}{TS1}{1}
840 \DeclareTextAccent{\capitalcircumflex}{TS1}{2}
841 \DeclareTextAccent{\capitaltilde}{TS1}{3}
842 \DeclareTextAccent{\capitaldieresis}{TS1}{4}
843 \DeclareTextAccent{\capitalhungarumlaut}{TS1}{5}

```

```

844 \DeclareTextAccent{\capitalring}{TS1}{6}
845 \DeclareTextAccent{\capitalcaron}{TS1}{7}
"08 = 8
846 \DeclareTextAccent{\capitalbreve}{TS1}{8}
847 \DeclareTextAccent{\capitalmacron}{TS1}{9}
848 \DeclareTextAccent{\capitaldotaccent}{TS1}{10}

```

Tie accents.

The tie accent was borrowed from the `cmmi` font. The `tc` fonts now provide four tie accents, the first two are done in the classical way with asymmetric glyphs hanging out of their boxes; the new ties are centered in their boxes like all other accents. They need a name: please tell us if you know what to call them.

```

" = 
849 \DeclareTextAccent{\t}{TS1}{26}
850 \DeclareTextAccent{\capitaltie}{TS1}{27}
851 \DeclareTextAccent{\newtie}{TS1}{28}
852 \DeclareTextAccent{\capitalnewtie}{TS1}{29}

```

Compound word marks.

The text companion fonts contain two compound word marks of different heights, one has `cap_height`, the other `asc_height`.

```

853 \DeclareTextSymbol{\textcapitalcompwordmark}{TS1}{23}
854 \DeclareTextSymbol{\textascendercompwordmark}{TS1}{31}

```

The text companion symbols.

```

855 \DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
"10 = 16
856 \DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
857 \DeclareTextSymbol{\texttwelvedash}{TS1}{21}
858 \DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}
"18 = 24
859 \DeclareTextSymbol{\textleftarrow}{TS1}{24}
860 \DeclareTextSymbol{\textrightarrow}{TS1}{25}
"20 = 32
861 \DeclareTextSymbol{\textblank}{TS1}{32}
862 \DeclareTextSymbol{\textdollar}{TS1}{36}
863 \DeclareTextSymbol{\textquotesingle}{TS1}{39}
"28 = 40

```

The symbol `\textasteriskcentered` “*” is supposed to be always available in `TS1` and that is important as it is used in footnote symbols. However, in a few fonts it is missing even though they are otherwise fairly complete. We therefore use a rather elaborate method and check if the slot has a glyph and if not produce a poor man’s version by using a normal “*” slightly enlarged and somewhat lowered. The main application for this symbol is in footnote symbols and there it should produce a comparable size and show a similar placement.

```

864 \% \DeclareTextSymbol{\textasteriskcentered}{TS1}{42} % that's wanted
865 \DeclareTextCommand \textasteriskcentered{TS1}{% % and that's needed
866   \iffontchar\font 42 \char42 \else
867     \begingroup\fontencoding{T1}%
868       \fontsize

```

```

869      {\the\dimexpr1.3\dimexpr\f@size pt\relax}%
870      {\f@baselineskip}%
871      \selectfont
872      \raisebox{-0.7ex}{[\dimexpr\height-0.7ex][0pt]{*}}%
873      \endgroup
874      \fi
875 }

Note that '054 is a comma and '056 is a full stop: these make numbers using oldstyle digits easier to input.

876 \DeclareTextSymbol{\textdblhyphen}{TS1}{45}

1.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package `fontspec` as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted from the `inputenc` UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to L^AT_EX L^IC^R commands.

A few additional names for character which were supported in the original `fontspec` version of this file have also been added, even though they are not currently in the default `inputenc` UTF-8 declarations.

```
980 <*TU>
```

In the base interface the Unicode encoding is always known as TU. But we parameterize the encoding name to allow for modelling differences in Unicode support by different fonts.

```
981 \providetcommand\UnicodeEncodingName{TU}
```

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then abort this file, switching back to T1 encoding.

```
982 \begingroup\expandafter\expandafter\expandafter\endgroup
983 \expandafter\ifx\csname XeTeXrevision\endcsname\relax
984   \begingroup\expandafter\expandafter\expandafter\endgroup
985   \expandafter\ifx\csname directlua\endcsname\relax
```

Not LuaTeX or XeTeX, abort with a warning.

```
986 \PackageWarningNoLine{fontenc}
987   {\UnicodeEncodingName\space
988     encoding is only available with XeTeX and LuaTeX.\MessageBreak
989     Defaulting to T1 encoding}
990   \def\encodingdefault{T1}
991   \expandafter\expandafter\expandafter\endinput
992 \else
```

LuaTeX. For LuaTeX 1.10+, define a Lua function to disable any handing by the font code. Otherwise we reload the font without TeX ligatures.

```
993 \def\UnicodeFontTeXLigatures{+tlig;}
994 \ifnum\luatexversion<110
995   \def\reserved@a{\%
996     \def\@remove@tlig##1{\@remove@tlig##1\@nil\@nil\relax}
997     \def\@remove@tlig##1#1{\@remove@tlig##1#1}
998   \edef\reserved@b{\detokenize{+tlig;}}
999   \expandafter\reserved@a\expandafter{\reserved@b}
1000 \def\@remove@tlig##1\@nil#2\relax{#1}
```

```

1001      \def\remove@tlig#1{%
1002          \begingroup
1003          \font\remove@tlig
1004          \expandafter\@remove@tlig\expandafter{\fontname\font}%
1005          \remove@tlig
1006          \char#1\relax
1007          \endgroup
1008      }
1009  \else
1010      \newprotectedluacmd\@remove@tlig@@@%

```

Now we can define the function. Mostly we just have to insert a protected glyph node, which is a glyph node with subtype 256. But we have to keep track of the current mode to avoid inserting the glyph into a vlist.

```

1011      \now@and@everyjob{\directlua{
1012          local rawchar_func = token.create'@remove@tlig@@@'.index
1013          local forcehmode = tex.forcehmode
1014          local put_next = token.put_next
1015          local glyph_id = node.id'glyph'
1016          local rawchar_token = token.new(rawchar_func, token.command_id'lua_call')
1017          lua.get_functions_table()[rawchar_func] = function()
1018              local mode = tex.nest.top.mode
1019              if mode == 1 or mode == -1 then
1020                  put_next(rawchar_token)
1021                  return forcehmode(true)
1022              end
1023              local n = node.new(glyph_id, 256)
1024              n.font = font.current()
1025              n.char = token.scan_int()
1026              return node.write(n)
1027          end
1028      }}

```

Now `\remove@tlig` can be implemented almost as in XeTeX.

```

1029      \def\remove@tlig#1{\@remove@tlig@@@#1\relax}
1030      \fi
1031      \fi
1032  \else
XeTeX
1033  \def\UnicodeFontTeXLigatures{mapping=tex-text;}
1034  \def\remove@tlig#1{\XeTeXglyph\numexpr\XeTeXcharglyph#1\relax}
1035  \fi
1036  \def\UnicodeFontFile#1#2{"[#1]:#2"}
1037  \def\UnicodeFontName#1#2{"#1:#2"}

    Declare the encoding
1038 \DeclareFontEncoding\UnicodeEncodingName{}{}

    Declare accent command to use a postspended combining character rather than the
TeX \accent primitive
1039 \def\add@unicode@accent#1#2{%
1040   \if\relax\detokenize{#2}\relax^\wedge a0\else#2\fi
1041   \char#1\relax}

```

In its original implementation `\DeclareUnicodeAccent` was given 3 arguments (with second the “Unicode encoding” a.k.a., `\UnicodeEncodingName`) while in other places, e.g., `\DeclareUnicodeComposite`, we always made encoding implicit. So we now change it here to implicit too so that the interfaces become a bit more consistent. To avoid making that a breaking change (even though it only affects two packages on CTAN) we test for #2 being `\UnicodeEncodingName`. This would not catch if somebody used `\DeclareUnicodeAccent{\=}{TU-sub}{“0304”}` but that fortunately hasn’t happened. With the implicit argument you would need to change `\UnicodeEncodingName` instead, as you have to do anyway for the other interface commands.

```

1042 \def\DeclareUnicodeAccent#1#2{%
1043   \edef\reserved@a{#2}%
1044   \edef\reserved@b{\UnicodeEncodingName}%
1045   \ifx\reserved@a\reserved@b
1046     \def\reserved@a{\DeclareUnicodeAccent@{#1}}%
1047   \else
1048     \def\reserved@a{\DeclareUnicodeAccent@{#1}\UnicodeEncodingName}%
1049   \fi
1050   \reserved@a{#2}%
1051 }
1052 \def\DeclareUnicodeAccent@#1#2#3{%
1053   \DeclareTextCommand{#1}{#2}{\addunicode@accent{#3}}%
1054 }
```

Wrapper around `\DeclareTextCompositeCommand` that uses the declared composite if it exists in the current font or falls back to the default definition for the TU accent if not.

```

1055 {
1056   \catcode\z@=11\relax
1057   \gdef\DeclareUnicodeComposite#1#2#3{%
1058     \def\reserved@a##1##2{%
1059       \DeclareTextCompositeCommand#1\UnicodeEncodingName{#2}{%
1060         \iffontchar\font#3 ##2%
1061           \else ##1\fi}%
1062         \expandafter\expandafter\expandafter\extract@default@composite
1063         \csname\UnicodeEncodingName\string#1\endcsname{#2}\@nil
1064       \bgroup
1065         \lccode\z@#3 %
1066         \lowercase{\egroup
1067           \expandafter\reserved@a\expandafter{\reserved@b}{^{\z@}}}}%
1068     }
1069   \def\extract@default@composite#1{%
1070     \ifx\@text@composite#1%
1071       \expandafter\extract@default@composite@a
1072     \else
1073       \expandafter\extract@default@composite@b\expandafter#1%
1074     \fi}
1075   \def\extract@default@composite@a#1\@text@composite#2\@nil{%
1076     \def\reserved@b{#2}}
1077   \def\extract@default@composite@b#1#2\@nil{%
1078     \def\reserved@b{#1#2}}
```

Next two commands are simply syntactic sugar to go with the other `\DeclareUnicode...` declarations.

```

2 Package files

This file now also contains some packages that provide access to the more specialised encodings.

2.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding `FOO`, the package looks to see if the encoding `FOO` has already been declared. If it has not, the file `fooenc.def` is loaded. The default encoding is set to be `FOO`.

In addition the package at the moment contains extra code to extend the `\@uclclist` (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```
1504 <*package>
```

Here we define a macro that extends the `\@uclclist` if needed and afterwards turns itself in a noop.

```

1505 \def\update@uclc@with@cyrilllic{%
1506   \expandafter\def\expandafter@\uclclist\expandafter
1507   {\@uclclist
1508     \cyla\CYRA\cyrabhch\CYRABHCH\cyrabhchdsc\CYRABHCHDSC\cyrabhdze

1531   \CYRYO\cqryu\CYRYU\cyrz\CYRZ\cyrzdsc\CYRZDSC\cyrzh\CYRZH
1532   \cyrzhdsc\CYRZHDSC}%
1533 \let\update@uclc@with@cyrillic\relax
1534 }

```

Here we process each option:

```

1535 \DeclareOption*{%
1536   \let\encodingdefault\CurrentOption

```

From 2020/02/02 release onward we only load the encoding files if they haven't be loaded already. To check this we look if `\T@encoding` is already defined. If not we load (indicated by setting the switch `@tempswa` to true and we always load if we run in an older format (or rather in a rollback situation).

```

1537   \if@tempswafalse
1538     \cifl@t@r\fmtversion{2020/02/02}%
1539       {\expandafter\ifx\csname T@\CurrentOption\endcsname\relax
1540         \else\fi}%
1541       {\@tempswatrue\fi}%

```

Load if necessary:

```

1542 \if@tempswa
1543   \edef\reserved@f{%
1544     \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}%
1545   \reserved@f
1546   \InputIfFileExists\reserved@f
1547     {}{\PackageError{fontenc}%
1548       {Encoding file '\reserved@f' not found.%}
1549       \MessageBreak
1550       You might have misspelt the name of the encoding}%
1551       {Necessary code for this encoding was not
1552        loaded.\MessageBreak
1553        Thus calling the encoding later on will
1554        produce further error messages.}%
1555   \let\reserved@f\relax

```

In case the current encoding is one of a list of known cyrillic ones we extend the `\@uclclist`:

```

1556   \expandafter\in@\expandafter{\CurrentOption}%
1557     {T2A,T2B,T2C,X2,LCY,OT2}%
1558 \ifin@

```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the `\@uclclist` gets unnecessarily big, slowing down the processing at runtime.

```

1559   \expandafter\in@\expandafter\cyra\expandafter
1560     {\@uclclist}%
1561   \ifin@
1562   \else
1563     \update@uclc@with@cyrillic
1564   \fi
1565 \fi

```

```

1566   \fi
1567 }
1568 \ProcessOptions*

```

We select the new font encoding default (i.e., the last encoding specified in the option list. But this encoding may not work with the current `\f@shape`, e.g., LY1 is not defined for `cmr` and therefore packages switching to LY1 usually also change `\rmdefault`. But that only applies at `\begin{document}` so we get a spurious warning if we use what L^AT_EX previously used:

```

1569 \%fontencoding\encodingdefault\selectfont

```

So instead we do this here:

```

1570 \usefont\encodingdefault\familydefault\seriesdefault\shapedefault

```

To save some space we get rid of the macro extending the `\@uclclist` (might have happened already).

```

1571 \let\update@uclc@with@cyrillic\relax

```

Finally we pretend that the `fontenc` package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```

1572 \let\@elt\relax
1573 \xdef\@fontenc@load@list{\@fontenc@load@list
1574   \@elt{\csname opt@fontenc.sty\endcsname}}

```

```

1575 \global\expandafter\let\csname ver@@fontenc.sty\expandafter\endcsname
1576   \csname ver@fontenc.sty\endcsname
1577 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
1578 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
1579 \global\let\@ifl@ter@@\@ifl@ter
1580 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@}
1581 {/package}

```

File t

ltcounts.dtx

1 Counters and Lengths

Commands for defining and using counters. This file defines:

<code>\newcounter</code>	To define a new counter.
<code>\setcounter</code>	To set the value of counters.
<code>\addtocounter</code>	Increase the counter #1 by the number #2.
<code>\stepcounter</code>	Increase a counter by one.
<code>\refstepcounter</code>	Increase a counter by one, also setting the value used by <code>\label</code> .
<code>\value</code>	For accessing the value of the counter as a TeX number (as opposed to <code>\the<counter></code> which expands to the <i>printed</i> representation of <code><counter></code>)
<code>\arabic</code>	<code>\arabic{<counter>}</code> : 1, 2, 3, ...
<code>\roman</code>	<code>\roman{<counter>}</code> : i, ii, iii, ...
<code>\Roman</code>	<code>\Roman{<counter>}</code> : I, II, III, ...
<code>\alph</code>	<code>\alph{<counter>}</code> : a, b, c, ...
<code>\Alpha</code>	<code>\Alpha{<counter>}</code> : A, B, C, ...
<code>\fnsymbol</code>	<code>\fnsymbol{<counter>}</code> : *, †, ‡, ...
<code>\counterwithin</code>	<code>\counterwithin[<format>]{<counter>}{<within-counter>}</code> : Resets <code><counter></code> whenever <code><within-counter></code> is stepped. Also redefines <code>\the<counter></code> command to produce <code>\the<within-counter>.(<format>){<counter>}</code> with <code>\arabic</code> as the default for <code><format></code> . Star form omits redefining the print representation.
<code>\counterwithout</code>	<code>\counterwithout[<format>]{<counter>}{<within-counter>}</code> : Removes <code><counter></code> from the reset list of <code><within-counter></code> . Also redefines <code>\the<counter></code> command to produce <code><format>{<counter>}</code> with <code>\arabic</code> as the default for <code><format></code> . Star form omits redefining the print representation.
1 <code>(*2ekernel)</code>	

1.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

<code>\c@foo</code>	Contains the counter's numerical value. It is defined by <code>\newcount\foocounter</code> .
<code>\thefoo</code>	Macro that expands to the printed value of <code>\foocounter</code> . For example, if sections are numbered within chapters, and section headings look like
	Section II-3. The Nature of Counters
	then <code>\thesection</code> might be defined by:
	<code>\def\thesection</code> <code>{\@Roman{\c@chapter}-\@arabic{\c@section}}</code>
<code>\p@foo</code>	Macro that expands to a printed 'reference prefix' of counter foo. Any <code>\ref</code> to a value created by counter foo will produce the expansion of <code>\p@foo\thefoo</code> when the <code>\label</code> command is executed. See file <code>ltxref.dtx</code> for an extension of this mechanism.
<code>\cl@foo</code>	List of counters to be reset when foo stepped. Has format <code>\@elt{counterA}\@elt{counterB}\@elt{counterC}</code> .

NOTE:

`\thefoo` and `\p@foo` must be defined in such a way that `\edef\bar{\thefoo}` or `\edef\bar{\p@foo}` defines `\bar` so that it will evaluate to the counter value at the time of the `\edef`, even after `\foocounter` and any other counters have been changed. This will happen if you use the standard commands `\@arabic`, `\@Roman`, etc.

The following commands are used to define and modify counters.

`\refstepcounter{<foo>}`

Same as `\stepcounter`, but it also defines `\@currentreference` so that a subsequent `\label{<bar>}` command causes `\ref{<bar>}` to generate the current value of counter `<foo>`.

`\@definecounter{<foo>}`

Initializes counter `{<foo>}` (with empty reset list), defines `\p@foo` and `\thefoo` to be null. Also adds `<foo>` to `\cl@ckpt` – the reset list of a dummy counter `@ckpt` used for taking checkpoints for the `\include` system.

`\@addtoreset{<foo>}{<bar>}` : Adds counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\@removefromreset{<foo>}{<bar>}` : Removes counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\setcounter{<foo>}{<val>}` : Globally sets `\foocounter` equal to `<val>`.

```
2 \def\setcounter#1#2{%
3   \@ifundefined{c@#1}%
4     {\@nocounterr{#1}}%
5     {\global\csname c@#1\endcsname#2\relax}}
```

(End definition for `\setcounter`.)

`\addtocounter{<foo>}{<val>}` Globally increments `\foocounter` by `<val>`.

```
6 \def\addtocounter#1#2{%
7   \@ifundefined{c@#1}%
8     {\@nocounterr{#1}}%
9     {\global\advance\csname c@#1\endcsname #2\relax}}
```

(End definition for `\addtocounter`.)

`\newcounter{<newctr>}[<oldctr>]` Defines `<newctr>` to be a counter, which is reset when counter `<oldctr>` is stepped. If `<newctr>` already defined produces ‘`c@newctr already defined`’ error.

```
10 \def\newcounter#1{%
11   \expandafter\@ifdefinable \csname c@#1\endcsname
12     {\@definecounter{#1}}%
13     \@ifnextchar[\{\@newctr{#1}\}{}]}
```

(End definition for `\newcounter`.)

`\value{<ctr>}` produces the value of counter `<ctr>`, for use with a `\setcounter` or `\addtocounter` command.

```
14 \def\value#1{\csname c@#1\endcsname}
```

(End definition for `\value`.)

`\@newctr`

```
15 \def\@newctr#1[#2]{%
16   \@ifundefined{c@#2}{\@nocounterr{#2}}{\@addtoreset{#1}{#2}}}
```

(End definition for \@newctr.)

\stepcounter \stepcounterfoo Globally increments counter \c@FOO and resets all subsidiary counters.

```
17 \def\stepcounter#1{%
18   \addtocounter{#1}\@ne
19   \begingroup
20     \let\@elt\@stpelt
21     \csname cl@#1\endcsname
22   \endgroup}
```

(End definition for \stepcounter.)

\@stpelt Rather than resetting the “within” counter to zero we set it to -1 and then run \stepcounter that moves it to 0 and also initiates resetting the next level down.

```
\@fnsymbol Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.
```

This macro is another example of an ever recurring problem in TeX: Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an \edef or \write where an \ifmmode test would be executed prematurely. Hence in the implementation below, \@fnsymbol is not robust in itself but the parts doing the actual typesetting are.

In the case of \@fnsymbol we make use of the robust command \TextOrMath which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a \relax token if run under regular TeX, which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use eTeX as engine for L^AT_EX (as recommended) this unfortunate side effect is not present.

```

182 〈\latexrelease〉\EndIncludeInRelease
183 〈*2ekernel〉

```

(End definition for \cfnsymbol.)

- \TextOrMath When using regular TeX, we make this command robust so that it always selects the correct branch in an \ifmmode switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic \IeC from inputenc but then it will have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell. However, users of eTeX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eTeX but making sure not to permanently turn \protected into \relax.

```

184 〈/2ekernel〉
185 〈\latexrelease〉\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
186 〈*2ekernel | latexrelease〉
187 \begingroup\expandafter\expandafter\expandafter\endgroup
188 \expandafter\ifx\csname protected\endcsname\relax

```

In case of ordinary TeX we define \TextOrMath as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```

189 \DeclareRobustCommand\TextOrMath{%
190   \ifmmode \expandafter\@secondoftwo
191   \else \expandafter\@firstoftwo \fi}
192 \protected@edef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
193 \else

```

For eTeX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```

194 \protected\expandafter\def\csname TextOrMath\space\endcsname{%
195   \ifmmode \expandafter\@secondoftwo
196   \else \expandafter\@firstoftwo \fi}
197 \edef\TextOrMath#1#2{%
198   \expandafter\noexpand\csname TextOrMath\space\endcsname
199   {#1}{#2}}
200 \fi
201 〈/2ekernel | latexrelease〉

`\@settopoint` This macro takes the contents of the skip register that is supplied as its argument and removes the fractional part to make it a whole number of points. This can be used in class files to avoid values like 345.466666pt when calculating a dimension.

```
22 \def\@settopoint#1{\divide#1\p@\multiply#1\p@}
23 \end{macro}
```

(End definition for `\@settopoint`.)

File v

ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX ‘New’ Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

1 Preliminary macros

We define a number of macros that will be used later.

`\@nomath` `\@nomath` is used by most macros that will have no effect in math mode. It issues a warning message.

```
1  {*2ekernel}
2  \def\@nomath#1{\relax\ifmmode
3      \@font@warning{Command \noexpand#1invalid in math mode}\fi}
```

(End definition for `\@nomath`.)

`\no@alphabet@error` The macro `\no@alphabet@error` is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The `\relax` at the beginning is necessary to prevent T_EX from scanning too far in certain situations.

```
4  \gdef\no@alphabet@error#1{\relax \ifmmode
5      \@latex@error{Math\space alphabet\space identifier\space
6          \noexpand#1is\space undefined\space in\space math\space
7          version\space ‘\math@version’}%
8      {Your\space requested\space math\space alphabet\space
9          is\space undefined\space in\space the\space current\space
10         math\space version.^^JCheck\space the\space spelling\space
11         or\space use\space the\space \noexpand\SetMathAlphabet\space
12         command.}%
13     \fi}
```

(End definition for `\no@alphabet@error`.)

`\new@mathgroup` `\mathgroup` We also give a new name to `\newfam` and `\fam` to avoid verbal confusion (see the introduction).²³

```
14  \%def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@n}
15  \let\mathgroup\fam
16  \%let\newfam\new@mathgroup
17  \onlypreamble\new@mathgroup
```

(End definition for `\new@mathgroup` and `\mathgroup`.)

²³For the same reason it seems advisable to `\let\fam` and `\newfam` equal to `\relax`, but this is commented out to retain compatibility to existing style files.

2 Macros for setting up the tables

```

188   {}%
```

Don't know at the moment what this group here does!

```
189 \begingroup
```

We define a macro `\reserved@f`²⁴ that grabs the next *size* and loads the corresponding font. This is done by delimiting `\reserved@f`'s only argument by the token `,` (comma).

```
190 \def\reserved@f##1,{%
```

The end of the list will be detected when there are no more elements, i.e. when `\reserved@f`'s argument is empty. The trick used here is explained in Appendix D of the TeXbook: if the argument is empty the `\if` will select the first clause and `\let` `\reserved@f` equal to `\relax`. (We use the `>` character here since it cannot appear in font file names.)

```
191 \if>##1>%
192 \let\reserved@f\relax
193 \else
```

Otherwise, we define `\font@name` appropriately and call `\pickup@font` to do the work. Note that the requested `\curr@fontshape` combination must have been defined, or you will get an error. The definition of `\font@name` is carried out globally to be consistent with the rest of the code in this file.

```
194 \xdef\font@name{\csname#1/#2/#3/#4/#1\endcsname}%
195 \pickup@font
```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to `\relax`. This means that later on, when the font is first used, the macro `\define@newfont` is called again to execute the 'extra' macro for this font.

```
196 \global\expandafter\let\font@name\relax
197 \fi
```

Finally we call `\reserved@f` again to process the next *size*. If `\reserved@f` was `\let` equal to `\relax` this will end the macro.

```
198 \reserved@f}%
```

We finish with reinserting the list of sizes after the `\reserved@f` macro and appending an empty element so that the end of the list is recognized properly.

```
199 \reserved@f#5,%
200 \endgroup
201 }%
202 }
203 @onlypreamble\DeclarePreloadSizes
```

(End definition for `\DeclarePreloadSizes`.)

`\ifmath@fonts` We need a switch to decide if we have to switch math fonts. For this purpose we provide `\ifmath@fonts` that can be set to true or false by the `\S@...` macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

```
204 \newif\ifmath@fonts \math@fontstrue
```

(End definition for `\ifmath@fonts`.)

²⁴We cannot use `\@tempa` since it is needed in `\pickup@font`.

\DeclareMathSizes \DeclareMathSizes takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right \S@... macro.

```

3 Selecting a new font

3.1 Macros for the user

```
\fontencoding  
\f@encoding
```

As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros `\f@family`, `\f@series`, and `\f@shape`, resp. We use `\edef`'s so that the arguments can also be macros.

```
251 \DeclareRobustCommand\fontencoding[1]{%  
252     \expandafter\ifx\csname T@\#1\endcsname\relax  
253         \@latex@error{Encoding scheme '#1' unknown}\@eha  
254     \else  
255         \edef\f@encoding{\#1}%  
256         \ifx\cf@encoding\f@encoding
```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a `\selectfont` in-between we can save processing by making sure that `\enc@update` is `\relax`.

```
257     \let\enc@update\relax  
258 \else
```

If current and new encoding differ we define the macro `\enc@update` to contain all updates necessary at `\selectfont` time.

```
259     \let\enc@update\@enc@update  
260     \fi  
261     \fi  
262 }
```

(End definition for `\fontencoding` and `\f@encoding`.)

```
\@enc@update
```

```
263 \def\@enc@update{%
```

When `\@enc@update` is executed `\f@encoding` holds the encoding name for the new encoding and `\cf@encoding` the name of the last active encoding.

We start by setting the init command for encoding dependent macros to `\@changed@cmd`.

```
264     \expandafter  
265     \let  
266         \csname\cf@encoding-\cmd\endcsname  
267         \@changed@cmd
```

Then we turn the one for the new encoding to `\@current@cmd` (see `ltoutenc.dtx` for further explanations).

```
268     \expandafter  
269     \let  
270         \csname\f@encoding-\cmd\endcsname  
271         \@current@cmd
```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```
272     \default@T  
273     \csname T@\f@encoding\endcsname
```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```

274      \csname D@\f@encoding\endcsname
275      \let\enc@update\relax
276      \let\cf@encoding\f@encoding
277 }
```

(End definition for \@@enc@update.)

`\enc@update` The default action in `\selectfont` is to do nothing.

```
278 \let\enc@update\relax
```

(End definition for \enc@update.)

`\fontfamily`

`\f@family`

`\fontseries`

`\f@series`

`\fontshape`

`\f@shape`

```
279 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{#1}}
```

There are now defined later (and differently).

```
280 \% \DeclareRobustCommand\fontseries[1]{\edef\f@series{#1}}
```

```
281 \% \DeclareRobustCommand\fontshape [1]{\edef\f@shape{#1}}
```

(End definition for \fontfamily and others.)

`\usefont` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

`\fontencoding` needs to do some setup work so we call that, but instead of calling `\fontfamily`, `\fontseries` and `\fontshape` it earlier versions of this code did, we now set `\f@family`, etc. directly. If we would call `\fontseries` or `\fontshape` as it was done in the past, they would now interact with the existing series and shape which is not desired if we intend to use an explicit font shape!

```

282 </2ekernel>
283 <*2ekernel | latexrelease>
284 <latexrelease>\IncludeInRelease{2021/06/01}%
285 <latexrelease>          {\usefont}{Force font face}%
286 \DeclareRobustCommand\usefont[4]{\fontencoding{#1}%
287     \edef\f@family{#2}%
288     \set@target@series{#3}%
289     \edef\f@shape{#4}}%
```

Any earlier `\fontseries`, etc. should be canceled and we should switch unconditionally to the requested font face so we drop any code that may have been stored in `\delayed@f@adjustment`.

```

290 \let\delayed@f@adjustment\empty
291 \selectfont
292 \ignorespaces}
293 </2ekernel | latexrelease>
294 <latexrelease>\EndIncludeInRelease
295 <latexrelease>\IncludeInRelease{2020/02/02}%
296 <latexrelease>          {\usefont}{Drop m in usefont}%
297 <latexrelease>
298 <latexrelease>\DeclareRobustCommand\usefont[4]{\fontencoding{#1}%
299 <latexrelease>    \edef\f@family{#2}%
300 <latexrelease>    \set@target@series{#3}%
301 <latexrelease>    \edef\f@shape{#4}\selectfont
```

```

307 〈latexrelease〉
308 〈latexrelease〉\DeclareRobustCommand\usefont[4]{\fontencoding{\#1}%
309 〈latexrelease〉 \edef\f@family{\#2}%
310 〈latexrelease〉 \edef\f@series{\#3}%
311 〈latexrelease〉 \edef\f@shape{\#4}\selectfont
312 〈latexrelease〉 \ignorespaces}
313 〈latexrelease〉
314 〈latexrelease〉\EndIncludeInRelease
315 {*2ekernel}

(End definition for \usefont.)

```

\linespread The command `\linespread` changes the current `\baselinestretch` by calling `\set@fontsize`. The values for `\f@size` and `\f@baselineskip` will be left unchanged.

```

316 \DeclareRobustCommand\linespread[1]
317 {\set@fontsize{\#1}\f@size\f@baselineskip}

```

(End definition for `\linespread`.)

\fontsize We also define a macro that allows to specify a size. In this case, however, we also need the value of `\baselineskip`. As the first argument to `\set@fontsize` we pass the current value of `\baselinestretch`. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using `\renewcommand`. If we would pass the internal `\f@linespread` such a change would be effectively overwritten by a size change.

```

318 \DeclareRobustCommand\fontsize[2]
319 {\set@fontsize\baselinestretch{\#1}{\#2}}

```

(End definition for `\fontsize`.)

\f@linespread This macro holds the current internal value for `\baselinestretch`.

```

320 \let\f@family\empty
321 \let\f@series\empty
322 \let\f@shape\empty
323 \let\f@size\empty
324 \let\f@baselineskip\empty
325 \let\f@linespread\empty

```

(End definition for `\f@linespread`.)

\cf@encoding

```

326 \let\f@encoding\empty
327 \let\cf@encoding\empty

```

(End definition for `\cf@encoding`.)

\@defaultunits The function \@defaultunits when wrapped around a dimen or skip assignment supplies default units. Usage:

```
\@defaultunits\dimen@=#1pt\relax\@nnil
```

Note: the \relax is *important*. Other units can be substituted for the ‘pt’ if desired.

We use \remove@to@nnil as an auxiliary macros for \@defaultunits. It just has to gobble the supplied default unit ‘pt’ or whatever, if it wasn’t used in the assignment.

```
328 \def\@defaultunits{\afterassignment\remove@to@nnil}
```

(End definition for \@defaultunits.)

\strip@pt This macro strips the characters pt produced by using \the on a dimen register.

```
\rem@pt 329 \begingroup  
330   \catcode`P=12  
331   \catcode`T=12  
332   \lowercase{  
333     \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@.##2\fi}}}  
334   \expandafter\endgroup\x  
335 \def\strip@pt{\expandafter\rem@pt\the}
```

(End definition for \strip@pt and \rem@pt.)

\mathversion \mathversion takes the math *version* name as argument, defines \math@version appropriately and switches to the font selected forcing a call to \glb@settings if the *version* is known to the system.

```
336 \DeclareRobustCommand\mathversion[1]  
337   {\@nomath\mathversion  
338    \expandafter\ifx\csname mv@\#1\endcsname\relax  
339      \@latex@error{Math version '#1' is not defined}\@eha\else  
340      \edef\math@version{\#1}\%
```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting \glb@currsize to an invalid value since this will trigger the setup when the formula starts.

```
341   \gdef\glb@currsize{}%
```

When the scope of the current \mathversion ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is todo the setting only if the version really has changed after all. This might be interesting in case of amstext and boldsymbol.

```
342   \aftergroup\glb@settings  
343   \fi}
```

(End definition for \mathversion and \math@version.)

If TeX would support a hook just before the end of a formula (opposite of \everymath so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in L^AT_EX the use of \$ (as the primitive TeX command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a \$ couldn’t be the short-hand

for starting and stopping that higher-level interface, it only means that the direct \TeX function must be hidden.

Anyway, since we don't have this and won't have it in $\text{\LaTeX} 2\varepsilon$ we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks \everymath and \everydisplay . But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

```
\frozen@everymath  New internal names for \everymath and \everydisplay.  
\frozen@everydisplay  
344  \let\frozen@everymath\everymath  
345  \let\frozen@everydisplay\everydisplay
```

(End definition for \frozen@everymath and \frozen@everydisplay.)

```
\everymath    Now we provide now user hooks that will be called in the frozen internals.  
\everydisplay  
346  \newtoks\everymath  
347  \newtoks\everydisplay
```

(End definition for \everymath and \everydisplay.)

```
\frozen@everydisplay Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook.
```

The check code may push tokens after the math formula with \aftergroup and they would prevent a $\$\$$ from dropping following spaces. We therefore use a switch to be set as the first thing after the group so that following code can determine if there was a display or some inline math (in the latter case we better not drop spaces). After setting the switch we also have to place \ignorespaces because setting the switch may be the only thing that happens after the display. The issue with handling of spaces was found in 2022, but it is really a bug fix for the code added in 2021/11.

```
348  {/2ekernel}  
349  {latexrelease}\IncludeInRelease{2021/11/15}  
350  {latexrelease}  {\frozen@everydisplay}{Handle spaces after math}%  
351  {*2ekernel | latexrelease}  
352  \frozen@everydisplay = {  
353  \aftergroup\@ignoretrue  \aftergroup\ignorespaces  
354  \check@mathfonts  
355  \the\everydisplay}
```

(End definition for \frozen@everydisplay.)

```
\frozen@everymath The frozen code for inline math is similar, except that here we do not want to drop following spaces.
```

```
356  \frozen@everymath = {  
357  \aftergroup\@ignorefalse  
358  \check@mathfonts  
359  \the\everymath}
```

(End definition for \frozen@everymath.)

```
360  {/2ekernel | latexrelease}  
361  {latexrelease}\EndIncludeInRelease  
362  {latexrelease}\IncludeInRelease{2020/10/01}  
363  {latexrelease}  {\frozen@everydisplay}{Handle spaces after math}%  
364  {latexrelease}
```

```

365 〈latexrelease〉\frozen@everydisplay = {\check@mathfonts
366 〈latexrelease〉                                \the\everydisplay}
367 〈latexrelease〉\frozen@everymath = {\check@mathfonts
368 〈latexrelease〉                                \the\everymath}
369 〈latexrelease〉
370 〈latexrelease〉\EndIncludeInRelease
371 {*2ekernel}

```

`\curr@math@size` This holds locally the current math size.

```
372 \let\curr@math@size\empty
```

(*End definition for \curr@math@size.*)

3.2 Macros for loading fonts

`\pickup@font` The macro `\pickup@font` which is used in `\selectfont` is very simple: if the font name is undefined (i.e. not known yet) it calls `\define@newfont` to load it.

```

373 \def\pickup@font{%
374     \expandafter \ifx \font@name \relax
375         \define@newfont
376     \fi}

```

(*End definition for \pickup@font.*)

`\split@name` `\pickup@font` assumes that `\font@name` is set but it is sometimes called when `\f@family`, `\f@series`, `\f@shape`, or `\f@size` may have the wrong settings (see, e.g., the definition of `\getanddefine@fonts`). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define `\split@name` which takes the font name as a list of characters of `\catcode` 12 (without the backslash at the beginning) delimited by the special control sequence `\@nil`. This is not very complicated: we first ensure that / has the right `\catcode`

```
377 {\catcode`\/=12
```

and define `\split@name` so that it will define our private `\f@encoding`, `\f@family`, `\f@series`, `\f@shape`, and `\f@size` macros.

```

378 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%
379                                         \def\f@family{#2}%
380                                         \def\f@series{#3}%
381                                         \def\f@shape{#4}%
382                                         \def\f@size{#5}}

```

(*End definition for \split@name.*)

`\curr@fontshape` Abbreviation which may get removed again for speed.

```
383 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}
```

(*End definition for \curr@fontshape.*)

`\define@newfont` Now we can tackle the problem of defining a new font.

```
384 \def\define@newfont{%
```

We have already mentioned that the `\token` list that `\split@name` will get as argument must not start with a backslash. To reach this goal we will set the `\escapechar` to `-1` so that the `\string` primitive will not generate an escape character. To keep this change local we open a group. We use `\begingroup` for this purpose since `\define@newfont` might be called in math mode, and an empty `\bgroup...egroup` would add an empty `Ord` atom to the math list and thus affect the spacing.

Also locally redefine `\typeout` so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.

```
385  \begingroup
386    \let\typeout\@font@info
387    \escapechar\m@ne
```

Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four `\expandafter`'s so that `\font@name` is expanded first, then `\string`, and finally `\split@name`.

```
388  \expandafter\expandafter\expandafter
389    \split@name\expandafter\string\font@name\@nil
```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```
390 %   \expandafter\ifx
391 %     \csname\curr@fontshape\endcsname \relax
392   \try@load@fontshape % try always
393 %   \fi
394   \expandafter\ifx
395     \csname\curr@fontshape\endcsname \relax
396     \wrong@fontshape\else
```

To allow substitution we call the `curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```
397 %   \csname\curr@fontshape\endcsname
398   \extract@font\fi
```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```
399 \endgroup

400 \def\try@load@fontshape{%
401   \expandafter
402   \ifx\csname\f@encoding+\f@family\endcsname\relax
403     \@font@info{Trying to load font information for
404       \f@encoding+\f@family}%
405 }
```

We predefine this combination to be `\empty` which means that next time we don't try again unnecessary in case we don't find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```
405 \global\expandafter\let
406   \csname\f@encoding+\f@family\endcsname\empty
```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```
407 \nfss@catcodes
408 \let\nfss@catcodes\relax
```

For increased portability make the external filename monocase, but look for the (old style) mixed case filename if the first attempt fails.

On any monocase system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```
409     \edef\reserved@a{%
410         \lowercase{%
411             \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}{}}%
412         \reserved@a\relax
413         {\@input{\f@encoding\f@family.fd}}{}}%
414     \fi}
```

(End definition for `\define@newfont`.)

- `\nfss@catcodes` This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```
\expandafter\def\expandafter\nfss@catcodes
\expandafter{\nfss@catcodes <additional settings>}
```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```
415 \def\nfss@catcodes{%
```

We start by making @ a letter and ignoring all blanks and newlines.

```
416     \makeatletter
417     \catcode`\@=11
418     \catcode`^=12
419     \catcode`_=13
```

Then we set up \, {, }, # and % in case an `.fd` file is loaded during a verbatim environment.

```
420     \catcode`\\=0
421     \catcode`{=1
422     \catcode`}=2
423     \catcode`#=6
424     \catcode`^=7
425     \catcode`_=14
```

The we make sure that the important syntax parts have the right `\catcode`.

```
426     \@makeother<=0
427     \@makeother>=1
428     \@makeother*=2
429     \@makeother.=3
430     \@makeother-=4
431     \@makeother/=5
432     \@makeother[=6
433     \@makeother]=7
434     \@makeother`=8
435     \@makeother'=9
436     \@makeother"=10
437 }
```

(End definition for `\nfss@catcodes`.)

`\LoadFontDefinitionFile` Load and .fd files for some encoding and family (if it exists).

```
438 </2ekernel>
439 <*2ekernel | latexrelease>
440 <latexrelease>\IncludeInRelease{2020/02/02}%
441 <latexrelease>          {\LoadFontDefinitionFile}{Loading .fd files}%
442 \def\LoadFontDefinitionFile#1#2{%
443   \begingroup
444     \edef\f@encoding{#1}%
445     \edef\f@family{#2}%
446     \try@load@fontshape
447   \endgroup
448 }
449 </2ekernel | latexrelease>
450 <latexrelease>\EndIncludeInRelease
451 <latexrelease>\IncludeInRelease{0000/00/00}%
452 <latexrelease>          {\LoadFontDefinitionFile}{Loading .fd files}%
453 <latexrelease>
454 <latexrelease>\let\LoadFontDefinitionFile@\undefined
455 <latexrelease>\EndIncludeInRelease
456 <*2ekernel>
```

(End definition for `\LoadFontDefinitionFile`.)

`\DeclareFontFamilySubstitution` The idea for this macro is stolen from the `substitutefont` package by Günter Milde, with some modifications and a new name.

Its purpose is to provide characters in a special encoding that are not available in the current font family to be taken from a different family that is visually compatible (or not if you choose badly). For example, you can match the GFS Didot Greek characters with TeX Gyre Pagella (Palatino) by specifying

`\DeclareFontFamilySubstitution{LGR}{qpl}{udidot}`

This way if you ask for the LGR encoding in for the qpl family you get the characters from the uidot family substituted.

We need to ensure that the macro is defined with `\nfss@catcodes` in force (not quite sure why at the moment to be honest).

```
457 </2ekernel>
458 <*2ekernel | latexrelease>
459 <latexrelease>\IncludeInRelease{2020/02/02}%
460 <latexrelease>          {\DeclareFontFamilySubstitution}{Provide family substitution}%
461 \begingroup
462 \nfss@catcodes
463 \gdef\DeclareFontFamilySubstitution#1#2#3{%
```

We only provide a set of silent substitutions. The package also (re)declared the family, but this is incorrect in my eyes and it is better to handle that differently.

Of course the families may still need loading at this point and so we arrange for this. Otherwise we might run into trouble because the necessary `\DeclareFontFamily` has not been seen.

```
464   \LoadFontDefinitionFile{#1}{#2}%
465   \LoadFontDefinitionFile{#1}{#3}%
```

```

466  \DeclareFontShape{\#1}{\#2}{m}{it}{<->ssub * #3/m/it}{}%
467  \DeclareFontShape{\#1}{\#2}{m}{n}{<->ssub * #3/m/n}{}%
468  \DeclareFontShape{\#1}{\#2}{m}{sc}{<->ssub * #3/m/sc}{}%
469  \DeclareFontShape{\#1}{\#2}{m}{s1}{<->ssub * #3/m/s1}{}%

```

These days a few more shapes might be around, so we declare those too. If they don't exist then after the first substitution normal fallbacks will happen.

```

470  \DeclareFontShape{\#1}{\#2}{m}{sw}{<->ssub * #3/m/sw}{}%
471  \DeclareFontShape{\#1}{\#2}{m}{scit}{<->ssub * #3/m/scit}{}%
472  \DeclareFontShape{\#1}{\#2}{m}{scsl}{<->ssub * #3/m/scsl}{}%

```

Same game with b and bx, for other weights you are on your own:

```

473  \DeclareFontShape{\#1}{\#2}{b}{it}{<->ssub * #3/b/it}{}%
474  \DeclareFontShape{\#1}{\#2}{b}{n}{<->ssub * #3/b/n}{}%
475  \DeclareFontShape{\#1}{\#2}{b}{scit}{<->ssub * #3/b/scit}{}%
476  \DeclareFontShape{\#1}{\#2}{b}{scsl}{<->ssub * #3/b/scsl}{}%
477  \DeclareFontShape{\#1}{\#2}{b}{sc}{<->ssub * #3/b/sc}{}%
478  \DeclareFontShape{\#1}{\#2}{b}{s1}{<->ssub * #3/b/s1}{}%
479  \DeclareFontShape{\#1}{\#2}{b}{sw}{<->ssub * #3/b/sw}{}%
480  \DeclareFontShape{\#1}{\#2}{bx}{it}{<->ssub * #3/bx/it}{}%
481  \DeclareFontShape{\#1}{\#2}{bx}{n}{<->ssub * #3/bx/n}{}%
482  \DeclareFontShape{\#1}{\#2}{bx}{scit}{<->ssub * #3/bx/scit}{}%
483  \DeclareFontShape{\#1}{\#2}{bx}{scsl}{<->ssub * #3/bx/scsl}{}%
484  \DeclareFontShape{\#1}{\#2}{bx}{sc}{<->ssub * #3/bx/sc}{}%
485  \DeclareFontShape{\#1}{\#2}{bx}{s1}{<->ssub * #3/bx/s1}{}%
486  \DeclareFontShape{\#1}{\#2}{bx}{sw}{<->ssub * #3/bx/sw}{}%
487 }

527 <latexrelease>      \gdef\f@size{#5}%
528 <latexrelease>      \gdef\f@baselineskip{#5pt}%
529 <latexrelease>}
530 <latexrelease>\EndIncludeInRelease
531 <*2ekernel>
532 \onlypreamble\DeclareErrorFont

```

(*End definition for \DeclareErrorFont.*)

`\wrong@fontshape` Before we come to the macro `\extract@font` we have to take care of unknown `\curr@fontshape` combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails T_EX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```

533 </2ekernel>
534 <latexrelease>\IncludeInRelease{2015/01/01}{\wrong@fontshape}%
535 <latexrelease>          {Font substitution in preamble}%
536 <*2ekernel | latexrelease>
537 \def\wrong@fontshape{%
538   \csname D@\f@encoding\endcsname % install defaults if in math

```

We remember the wanted `\curr@fontshape` combination which we will need in a moment.

```

539 \edef\reserved@a{\csname\curr@fontshape\endcsname}%
540 \ifx\last@fontshape\reserved@a
541   \errmessage{Corrupted NFSS tables}%
542   \error@fontshape
543 \else

```

Then we warn the user about the mess and set the shape to its default.

```

544 \let\f@shape\default@shape

```

If the combination is not known, try the default *series*.

```
545     \expandafter\ifx\csname\curr@fontshape\endcsname\relax
546         \let\f@series\default@series
```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```
547     \expandafter
548     \ifx\csname\curr@fontshape\endcsname\relax
549         \let\f@family\default@family
```

If we change the font family and we are in the preamble then the corresponding .fd file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in “NFSS tables corrupted”. After begin document that will not happen as all .fd files involved in substitution are loaded at \begin{document}.

```
550     \begingroup
551         \try@load@fontshape
552     \endgroup
553     \fi \fi
554     \fi
```

At this point a valid \curr@fontshape combination must have been found. We inform the user about this fact.

The \expandafter\string here stops TeX adding the space that it usually puts after command names in messages. The similar construction with \undefined just produces ‘undefined’, but saves a few tokens.

\@wrong@font@char is locally redefined in \UseTextSymbol from its normal (empty) definition, to report the symbol generating the font switch.

```
555     \@font@warning{Font shape `\\expandafter\\string\\reserved@a'
556             \\expandafter\\gobble\\string\\undefined\\MessageBreak
557             using `\\curr@fontshape' instead\\@wrong@font@char}%
558     \\global\\let\\last@fontshape\\reserved@a
```

We change \@defaultsubs to produce a warning at the end of the document. The macro \@defaultsubs is initially \relax but gets changed here if some default font substitution happens. It is then executed in \enddocument.

```
559     \\gdef\\@defaultsubs{%
560         \\@font@warning{Some font shapes were not available, defaults
561             substituted.\\@gobbletwo}}%
```

If we substitute a \curr@fontshape combination by the default one we don’t want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally \let the macro corresponding to the wanted combination equal to its substitution. This requires the use of four \expandafter’s since \csname...\endcsname has to be expanded before \reserved@a (i.e. the requested combination), and this must happen before the \let is executed.

```
562     \\global\\expandafter\\expandafter\\expandafter\\let
563         \\expandafter\\reserved@a
564             \\csname\\curr@fontshape\\endcsname
```

Now we can redefine \font@name accordingly. This *must* be done globally since it might occur in the group opened by \define@newfont. If we would this definition were local the closing \endgroup there would restore the old meaning of \font@name and then switch to the wrong font at the end of \selectfont although the correct font was loaded.

```

565     \xdef\font@name{%

603     {*2ekernel}

```

(End definition for `\wrong@fontshape`.)

`\@wrong@font@char` Normally empty but redefined in `\UseTextSymbol` so that the Font shape undefined message can refer to the symbol causing the problem.

```
604 \let\@wrong@font@char\@empty
```

(End definition for `\@wrong@font@char`.)

`\@defaultsubs` See above.

```
605 \let\@defaultsubs\relax
```

(End definition for `\@defaultsubs` and `\@defaultsubs`.)

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the TeXbook, p. 382).

606 `\def\strip@prefix#1>{}`

(End definition for `\strip@prefix`.)

4 Assigning math fonts to *versions*

`\install@mathalphabet` This is just another name for `\gdef` but we can redefine it if necessary later on.

607 `\let\install@mathalphabet\gdef`

(End definition for `\install@mathalphabet`.)

`\math@fonts`

608 `\let\math@fonts\empty`

(End definition for `\math@fonts`.)

`\select@group` `\select@group` has four arguments: the new *<math alphabet identifier>* (a control sequence), the *<math group number>*, the extra macro for math mode and the `\curr@fontshape` definition macro name. We first check if we are in math mode.

609 `%\def\select@group#1#2#3{\relax\ifmmode`

We do these things locally using `\begingroup` instead of `\bgroup` to avoid the appearance of an empty Ord atom on the math list.

610 `% \begingroup`

We set the math fonts for the *family* in question by calling `\getanddefine@fonts` in the correct environment.

611 `% \escapechar\m@ne`

612 `% \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%`

We globally select the math fonts...

613 `% \globaldefs\one \math@fonts`

... and close the group to restore `\globaldefs` and `\escapechar`.

614 `% \endgroup`

As long as no *size* or *version* change occurs the *<math alphabet identifier>* should simply switch to the installed *math group* instead of calling `\select@group` unnecessarily. So we globally redefine the first argument (the new *<math alphabet identifier>*) to expand into a `\mathgroup` switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro. The original code for the end of `\select@group` was

`\gdef#1{#3\mathgroup #2}#1\fi}`

i.e. first redefining the *<math alphabet identifier>* and then calling the new definition to switch to the wanted *<math group>*. Now we define the *<math alphabet identifier>* as a call to the `\use@mathgroup` command.

615 `% \xdef#1{\noexpand\use@mathgroup\noexpand#2%`

616 `{\number\csname c@mv@\math@version\endcsname}}%`

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro `\mv@{version}` so that it calls `\getanddefine@fonts` directly in future as well. We use the macro `\extract@alph@from@version` to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```

617 %     \expandafter\extract@alph@from@version
618 %         \csname mv@\math@version\expandafter\endcsname
619 %         \expandafter{\number\csname c@\mv@\math@version\endcsname}%
620 %         #1%
621 %         \stepcounter{mv@\math@version}%

```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```
622 %\expandafter #1\fi}
```

(*End definition for \select@group.*)

`\extract@alph@from@version` We proceed to the definition of the macro `\extract@alph@from@version`. As stated above, it takes a math alphabet identifier and a math version macro (e.g. `\mv@normal`) as its arguments.

```
623 \def\extract@alph@from@version#1#2#3{%
```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

```
\install@mathalphabet<math alphabet identifier> #3{%
  Definitions for #3}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

```
624 \def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%
```

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (#1), the following tokens in its third argument (#3), and the replacement text for the math alphabet identifier #3 in its second argument. (#2). This is then recorded for later use in a temporary macro `\reserved@b`.

```
625 \def\reserved@b##2{%
```

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (#1 and #3) and the yet to build new definitions for the math alphabet identifier #3.

```
626 \def\reserved@c####1{\gdef#1{##1####1##3}}%
```

Then we execute our auxiliary macro.

```
627     \expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group<math alphabet identifier>
    <math group number><math extra part>
<curr@fontshape definition>
```

So we define a new temporary macro `\reserved@a` that extracts these parts.

```
628     \def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

```
629         \reserved@c{%
630             \getanddefine@fonts{#2}##2%
631             \install@mathalphabet#3{%
632                 \relax\ifmmode \else \non@alpherr#3\fi
633                 \use@mathgroup##1{#2}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
634     \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi
635             \use@mathgroup##1{#2}}%
```

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

```
636     \expandafter\reserved@a\reserved@b\@nil
637 }
```

(End definition for `\extract@alph@from@version`.)

`\math@bgroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use `\bgroup` instead of `\begingroup` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```
638 \let\math@bgroup\bgroup
639 \def\math@egroup#1{#1\egroup}
```

(End definition for `\math@bgroup` and `\math@egroup`.)

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in mthscale.sty.

```
640 \gdef\calculate@math@sizes{%
641     \@font@info{Calculating\space math\space sizes\space for\space
642                 size\space <\f@size>}%
643     \dimen@\f@size \p@
644     \tempdima \defaultscriptratio \dimen@
645     \dimen@ \defaultscriptsratio \dimen@
646     \expandafter\xdef\csname S@\f@size\endcsname{%
647         \gdef\noexpand\tf@size{\f@size}%
648         \gdef\noexpand\sf@size{\strip@pt\tempdima}%
649         \gdef\noexpand\ssf@size{\strip@pt\dimen@}%
650         \noexpand\math@fontstrue}}
```

(End definition for `\calculate@math@sizes`.)

\defaultscriptratio The default ratio for math sizes is:
\defaultscriptscriptratio 1 to \defaultscriptratio to \defaultscriptscriptratio.
By default this is 1 to .7 to .5.

```

651 \def\defaultscriptratio{.7}
652 \def\defaultscriptscriptratio{.5}

```

(End definition for \defaultscriptratio and \defaultscriptscriptratio.)

\noaccents@ If we don't have a definition for \noaccents@ we provide a dummy.

```

653 \ifx\noaccents@\undefined
654   \let\noaccents@\empty
655 \fi

```

(End definition for \noaccents@.)

\showhyphens The \showhyphens command must be redefined since the version in plain.tex uses \tenrm. We have also made some further adjustments for its use in L^AT_EX.

```

656 </2ekernel>
657 <latexrelease>\IncludeInRelease{2017/01/01}{\showhyphens}%
658 <latexrelease>                                {XeTeX support for \showhyphens}%
659 <*2ekernel | latexrelease>
660 \ifx\XeTeXcharclass\undefined

```

Version for engines other than XeT_EX.

```

661 \DeclareRobustCommand\showhyphens[1]{%
662   \setbox0\vbox{%
663     \color@begingroup
664     \everypar{}%

668     \color@endgroup}}

```

```

669 \else

```

XeT_EX version. When using system fonts XeT_EX reports consecutive runs of characters as a single item in box logging, which means the standard \showhyphens does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the lmr OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that \tracingonline is locally zero.

```

670 \DeclareRobustCommand\showhyphens[1]{%
671   \setbox0\vbox{%
672     \usefont{TU}{lmr}{m}{n}%

File w

ltfssaxes.dtx

This file contains the implementation for handling extra axes splitting the series and the values into sub-categories. selection commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX Font Selection Scheme.

Everything in the this file got introduced 2020/02/02, so we use large rollback chunks, only interrupted if necessary.

```
1 <*2ekernel | latexrelease>
2 <latexrelease>\IncludeInRelease{2020/02/02}%
3 <latexrelease> {\DeclareFontSeriesChangeRule}{Series change rules}%
```

1 Changing the font series

In the original NFSS implementation the series was a single attribute stored in `\f@series` and so one always had to specify both weight and width together. This means it was impossible to typeset, a paragraph in a condensed font and inside have a few words in bold weight (but still condensed) without doing this manually by requesting `\fontseries{bc}\selectfont`.

The new implementation now works differently by looking both at the current value of `\f@series` and the requested new series and out of that combination selects a resulting series value. Thus, if the current series is `c` and we ask for `b` we now get `bc`.

This is done by consulting a simple lookup table. This table is configurable (though most likely that flexibility will seldom of ever be needed) Adding or changing entries in this table are done with `\DeclareFontSeriesChangeRule`.

1.1 The series lookup table

`\DeclareFontSeriesChangeRule` The `\DeclareFontSeriesChangeRule` defines entries in a simple database (implemented as a set of commands) that define mappings between from an existing series and requested new series and maps that to a result series (and additionally offers an alternative if the desired one is not existing):

```
#1 current \f@series
#2 requested new series
#3 result (if that exist for the given font family)
#4 alternative result (if #3 does not exist)
```

If an `.fd` file has its own substitution rules then #3 exist and thus #4 is not applied.

If there is no matching database entry or if neither the result nor the alternate result exist in the font family the requested new series is used (which then may trigger substitutions later on).

```
4 \def\DeclareFontSeriesChangeRule#1#2#3#4{%
5   \namedef{series@#1@#2}{\{\!\{#3\!\}{\!\!} {#4\!\}}}}
```

(End definition for `\DeclareFontSeriesChangeRule`.)

1.2 Mapping rules for series changes

The rules set up use explicit series values not `\..default` indirections; my current feeling is that this is in fact better.

With 9 weights and 9 width classes this table is getting a bit large in the end (324 entries) but on the other hand it doesn't change and accessing speed and it is fast this way.

We could alternatively split the axis and maintain weight and width separately, but that would take more processing time and would not allow for setting up explicit exceptions nicely (not sure that this would ever get used though).

Design considerations for mapping entries:

- We make `m` to reset both weight and width (as this is how it always worked). To reset just the width `?m` is provided and to reset just the weight `m?`.
- We do support “`mwidth`” and “`weightm`”, e.g., `mec` to mean “go to medium weight and extra-condensed width”. At the end of the process we automatically drop any leftover `m` in the series name (unless it is just a single `m`).
- If there is no table entry then the target series is used unconditionally. This means that any request to set both weight and width (e.g. `bx` or `ulc`) needs no table entries. For that reason there are no entries which have a weight+width as request (i.e., second argument).

In particular this is also true for cases involving `m`, e.g., `bm` (bold medium width) which automatically gets reduced result in `b` or `mc` (medium weight condensed) which becomes `c` as a result.

- Only a few entries have “alternative” values and perhaps most of them should get dropped. Or maybe not ... needs some thought perhaps.

The idea is that you don't want the normal substitution to kick in because that would reset the shape first and it may be better to stay with `b` when a change to `c` is requested and `bc` doesn't exist, than to go to first change the shape to `n` and then find that `bc/n` doesn't exist either and thus ending up with `m/n`.

- Also: while I did set up all nine standard weight values from `ul` to `ub` I only bothered to provide entries for `ec`, `sc`, `c` and `x`, because other levels of compression/expansion are not in any real fonts that I know.

Could and perhaps should be eventually extended to cover the whole set.

283 \DeclareFontSeriesChangeRule {x}{ul}{ulx}{}

```

Special rules for `lm` etc. aren't needed because if the target `lm` is requested it will be used if there is no rule and that is then reduced to `l` automatically. Same for `mc` and friends. Only `?m` and `m?` need rules.

So here are the special rules for `m?`:

```

284 \DeclareFontSeriesChangeRule {bc}{m?}{c}{}
285 \DeclareFontSeriesChangeRule {bec}{m?}{ec}{}
286 \DeclareFontSeriesChangeRule {bsc}{m?}{sc}{}
287 \DeclareFontSeriesChangeRule {bx}{m?}{x}{}
288 \DeclareFontSeriesChangeRule {b}{m?}{m}{}
289 \DeclareFontSeriesChangeRule {c}{m?}{c}{}
290 \DeclareFontSeriesChangeRule {ebc}{m?}{c}{}
291 \DeclareFontSeriesChangeRule {ebec}{m?}{ec}{}
292 \DeclareFontSeriesChangeRule {ebsc}{m?}{sc}{}
293 \DeclareFontSeriesChangeRule {ebx}{m?}{x}{}
294 \DeclareFontSeriesChangeRule {eb}{m?}{m}{}
295 \DeclareFontSeriesChangeRule {ec}{m?}{ec}{}
296 \DeclareFontSeriesChangeRule {elc}{m?}{c}{}
297 \DeclareFontSeriesChangeRule {elec}{m?}{ec}{}
298 \DeclareFontSeriesChangeRule {elsc}{m?}{sc}{}
299 \DeclareFontSeriesChangeRule {elx}{m?}{x}{}
300 \DeclareFontSeriesChangeRule {el}{m?}{m}{}
301 \DeclareFontSeriesChangeRule {lc}{m?}{c}{}
302 \DeclareFontSeriesChangeRule {lec}{m?}{ec}{}
303 \DeclareFontSeriesChangeRule {lsc}{m?}{sc}{}
304 \DeclareFontSeriesChangeRule {lx}{m?}{x}{}
305 \DeclareFontSeriesChangeRule {l}{m?}{m}{}
306 \DeclareFontSeriesChangeRule {m}{m?}{m}{}
307 \DeclareFontSeriesChangeRule {sbc}{m?}{c}{}
308 \DeclareFontSeriesChangeRule {sbec}{m?}{ec}{}
309 \DeclareFontSeriesChangeRule {sbsc}{m?}{sc}{}
310 \DeclareFontSeriesChangeRule {sbx}{m?}{x}{}
311 \DeclareFontSeriesChangeRule {sb}{m?}{m}{}
312 \DeclareFontSeriesChangeRule {sc}{m?}{sc}{}
313 \DeclareFontSeriesChangeRule {slc}{m?}{c}{}
314 \DeclareFontSeriesChangeRule {slec}{m?}{ec}{}
315 \DeclareFontSeriesChangeRule {slsc}{m?}{sc}{}
316 \DeclareFontSeriesChangeRule {slx}{m?}{x}{}
317 \DeclareFontSeriesChangeRule {sl}{m?}{m}{}
318 \DeclareFontSeriesChangeRule {ubc}{m?}{c}{}
319 \DeclareFontSeriesChangeRule {ubec}{m?}{ec}{}
320 \DeclareFontSeriesChangeRule {ubsc}{m?}{sc}{}
321 \DeclareFontSeriesChangeRule {ubx}{m?}{x}{}
322 \DeclareFontSeriesChangeRule {ub}{m?}{ub}{}
323 \DeclareFontSeriesChangeRule {ulc}{m?}{c}{}
324 \DeclareFontSeriesChangeRule {ulec}{m?}{ec}{}
325 \DeclareFontSeriesChangeRule {ulsc}{m?}{sc}{}
326 \DeclareFontSeriesChangeRule {ulx}{m?}{x}{}

```

```

327 \DeclareFontSeriesChangeRule {ul}{m?}{m}{}
328 \DeclareFontSeriesChangeRule {x}{m?}{x}{}
    And there the special rules for ?m:
329 \DeclareFontSeriesChangeRule {bc}{?m}{b}{}
330 \DeclareFontSeriesChangeRule {bec}{?m}{b}{}
331 \DeclareFontSeriesChangeRule {bsc}{?m}{b}{}
332 \DeclareFontSeriesChangeRule {bsc}{?m}{b}{}
333 \DeclareFontSeriesChangeRule {bx}{?m}{b}{}
334 \DeclareFontSeriesChangeRule {b}{?m}{b}{}
335 \DeclareFontSeriesChangeRule {c}{?m}{m}{}
336 \DeclareFontSeriesChangeRule {ebc}{?m}{eb}{}
337 \DeclareFontSeriesChangeRule {ebec}{?m}{eb}{}
338 \DeclareFontSeriesChangeRule {ebsc}{?m}{eb}{}
339 \DeclareFontSeriesChangeRule {ebsc}{?m}{eb}{}
340 \DeclareFontSeriesChangeRule {ebx}{?m}{eb}{}
341 \DeclareFontSeriesChangeRule {eb}{?m}{eb}{}
342 \DeclareFontSeriesChangeRule {ec}{?m}{m}{}
343 \DeclareFontSeriesChangeRule {elc}{?m}{el}{}
344 \DeclareFontSeriesChangeRule {elec}{?m}{el}{}
345 \DeclareFontSeriesChangeRule {elsc}{?m}{el}{}
346 \DeclareFontSeriesChangeRule {elsc}{?m}{el}{}
347 \DeclareFontSeriesChangeRule {elx}{?m}{el}{}
348 \DeclareFontSeriesChangeRule {el}{?m}{el}{}
349 \DeclareFontSeriesChangeRule {lc}{?m}{l}{}
350 \DeclareFontSeriesChangeRule {lec}{?m}{l}{}
351 \DeclareFontSeriesChangeRule {lsc}{?m}{l}{}
352 \DeclareFontSeriesChangeRule {lsc}{?m}{l}{}
353 \DeclareFontSeriesChangeRule {lx}{?m}{l}{}
354 \DeclareFontSeriesChangeRule {l}{?m}{l}{}
355 \DeclareFontSeriesChangeRule {m}{?m}{m}{}
356 \DeclareFontSeriesChangeRule {sbc}{?m}{sb}{}

1.3 Changing to a new series

```

391 <*2ekernel | latexrelease>
392 <latexrelease>\IncludeInRelease{2021/06/01}%
393 <latexrelease> {\fontseries}{delay fontseries update}%

```

\fontseries The `\fontseries` command takes one argument which is the requested new font series. In the orginal implementation it simply saved the expanded value in `\f@series`. Now we do a bit more processing and look up the final value in the font series data base. This is done by `\merge@font@series`. But the lookup should be done within the target family and call to `\fontseries` might be followed by a `\fontfamily` call. So we delay the processing to `\selectfont` and only record the necessary action in `\delayed@f@adjustment`.

```

394 \DeclareRobustCommand\fontseries[1]{\@forced@seriesfalse
395   \expandafter\def\expandafter\delayed@f@adjustment\expandafter

423 〈*2ekernel | latexrelease〉
424 〈latexrelease〉\IncludeInRelease{2020/02/02}%
425 〈latexrelease〉  {\merge@font@series}{Merge series values}%

```

`\merge@font@series` We look up the data base value by expanding the right command twice. If no such value exist then the result will be `\relax` otherwise it will be the two brace groups: the desired result and the alternate result. The first case means that the third argument to `\merge@font@series` will be empty.

```

426 \def\merge@font@series#1{%
427   \expandafter\expandafter\expandafter
428   \merge@font@series@
429     \csname series@\f@series \#1\endcsname
430     {\#1}%
431     \nil
432 }

```

(End definition for `\merge@font@series`.)

`\merge@font@series@` This now defines the new `\f@series`:

```
433 \def\merge@font@series@#1#2#3\@nil{%
```

If the third argument is empty there is no database entry for the combination and the second argument holds the new series so we return that.

Originally the test was simply `\ifx!#3!` but that actually dies if #3 starts with a conditional and in the definition of `\AmSfont` that is actually the case.

```

434 \%ifcat\expandafter X\detokenize{\#1}X%
435 \def\reserved@a{\#3}%
436 \ifx\reserved@a\empty
437   \set@target@series{\#2}%
438 \else

```

Otherwise we check if the desired result for the series (#1) exists for the font family and the current shape. All this happens inside `\selectfont` which has already taken care to load the `.fd` file if necessary.

```
439     \edef\reserved@a{\f@encoding / \f@family / #1 / \f@shape}%
440     \ifcsname \reserved@a \endcsname
```

If the desired result is available then we use that. However, we do need some post-processing because we need to drop surplus `ms` due to the way naming convention was designed in the '90s (sigh).

```
441     \set@target@series{#1}%
```

If not, then we try the alternate result (#2).

```
442     \else
443         \ifcsname \f@encoding / \f@family / #2 / \f@shape \endcsname
```

If the alternate result exist we use that and also issue a warning (or rather a log entry) that we didn't managed to change to the desired font.

```
444     \set@target@series{#2}%
445     \font@shape@subst@warning
```

If that doesn't exist either, then we use the requested series unmodified (again with a warning).

```
446     \else
447         \set@target@series{#3}%
448         \font@shape@subst@warning
449     \fi
450     \fi
451 \fi
452 }
```

It is possible that the previous font and the new one are actually identical (and the font was not found because it still needs loading) in which case a warning would look rather odd. So we make a quick check for that (which is the reason why we defined `\@reserved@a` above instead of doing inline testing inside `\ifcsname`).

```
453 \def\font@shape@subst@warning{%
454     \edef\reserved@b{\curr@fontshape}%
455     \ifx\reserved@a\reserved@b \else
456         \font@warning{Font shape '\reserved@a' undefined\MessageBreak
457                     using '\reserved@b' instead}%
458     \fi
459 }
```

(End definition for `\merge@font@series`.)

```
\merge@font@series@without@substitution
\merge@font@series@without@substitution@
\delayed@merge@font@series
```

`\merge@font@series@without@substitution` works like `\merge@font@series`, i.e., it looks up the combination in the rule base and if there exists an entry it uses it and if not it uses the new series value. However, it doesn't check if there is actually a font face with the new series value as `\merge@font@series` does. This simplified command is used in `\selectfont` at a point where other font attributes are not yet updated so that checking the font face might result incorrect in substitutions.

```
460 \def\merge@font@series@without@substitution#1{%
461     \expandafter\expandafter\expandafter
462     \merge@font@series@without@substitution@
463     \csname series@\f@series @#1\endcsname
```

```

464     {#1}%
465     \@nil
466 }
467 \def\merge@font@series@without@substitution{\@nil{%
468   \def\reserved@a{#3}%
469   \ifx\reserved@a\empty
470     \set@target@series{#2}%
471   \else
472     \set@target@series{#1}%
473   \fi
474 }

(End definition for \merge@font@series@without@substitution,
 \merge@font@series@without@substitution@, and \delayed@merge@font@series.)

```

`\delayed@merge@font@series` When we delay the merge action in `\fontseries` we first attempt to use merging without substitution. If that results in a non-existing font face the merge is redone in `\selectfont` using a version with substitution. See `\selectfont` for details.

```

475 \let\delayed@merge@font@series\merge@font@series@without@substitution
476
(End definition for \delayed@merge@font@series.)

```

`\maybe@load@fontshape` A small helper that we use a couple of times: try loading a fontshape (in a group because `\try@load@fontshape` normalizes catcodes and we also want to change `\typeout` so that it doesn't report missing .fd files on the terminal).

```

476 \def\maybe@load@fontshape{%
477   \begingroup
478   \let \typeout \font@info
479   \try@load@fontshape
480   \endgroup

```

(End definition for `\maybe@load@fontshape`.)

`\set@target@series` Finally the code for normalizing the `\f@series` value.

The combined series value determined by the mapping may still contain an `m` that we have to remove (as the .fd files use `c` not `mc` to denote a medium weight condensed series, etc.). We do this in all branches above because a user might have written

```
\DeclareFontSeriesChangeRule {m}{sc}{msc}{mc}
```

instead of using `sc` and `c` as needed in the .fd file.

```
481 \def\set@target@series#1{%
```

We need to `\edef` the argument first in case it starts with a conditional. Then we check (and perhaps drop) an "m" from the value and assign the result to `\f@series`.

```

482   \edef\f@series{#1}%
483   \series@maybe@drop@one@m\f@series\f@series
484 }
```

(End definition for `\set@target@series`.)

\series@maybe@drop@one@m If the series value is in NFSS notation then it should not contain any “m” unless it is just an “m” by its own. So we need to drop surplus “m”s. But we better don’t do this for full names, such as “semibold” as used by `autoinst`, for example. So we test against the possible explicit values that should drop an “m”. After that we assign the result to #2 for further use.

```
485 \def\series@maybe@drop@one@m#1{%
486   \expandafter\series@maybe@drop@one@m@\expandafter{\#1}}%
487
488 \def\series@maybe@drop@one@m@x#1#2{%
```

The code below is an inline version of the `\in@` macro without the group, so that it works in `\accent`.

```
489 \def\in@##1,#1,{}%
490 \series@check@toks\expandafter{\in@%
491   ,ulm,elm,lm,slm,mm,sbm,bm,ebm,ubm,muc,mec,mc,msc,msx,mx,mex,mux,{}{},#1,}%
492 \edef\in@{\the\series@check@toks}%
493 \ifx\in@{\empty}
```

The default definition for `\bfdefault` etc is actually `b\empty` so that we can detect if the user has changed the default. However that means a) the above test will definitely fail (maybe something to change) and b) we better use `\edef` on the next line to get rid of it as otherwise the test against #2 (e.g. `\bfdef@ult`) will fail in other places.

```
494 \edef#2{\#1}%
495 \else
496   \edef#2{\expandafter\series@drop@one@m #1\series@drop@one@m}%
497 \fi
498 }
```

As a precaution we use a private toks register not `\toks@` as that is no longer hidden inside the group.

```
499 \newtoks\series@check@toks
(End definition for \series@maybe@drop@one@m.)
```

\series@drop@one@m Drop up to two `ms` but keep one if that makes the series value empty. Actually, with the current implementation we know that there is at least one in the series value itself and we added one after it, so all we have to do is now returning #1#2 and dropping the rest.

```
500 \def\series@drop@one@m#1#2m#3\series@drop@one@m{%
501 % \ifx\relax#1#2\relax m\else#1#2\fi
502 #1#2%
503 }
```

```
(End definition for \series@drop@one@m.)

522 〈latexrelease〉\IncludeInRelease{2020/02/02}%
523 〈latexrelease〉 {\DeclareFontShapeChangeRule}{Font shape change rules}%

```

`\DeclareFontShapeChangeRule` The database for shapes is done in exactly the same way, only that it is much smaller and we usually have no alternative shape (or rather it is empty thus not used).

```

524 \def\DeclareFontShapeChangeRule #1#2#3#4{%
525   @namedef{shape@#1@#2}{\{\#3\}\{\#4\}}}

```

(*End definition for \DeclareFontShapeChangeRule.*)

There is kind of the same problem with returning back from `sc` to normal. It sort of needs its own letter. In `fontspec` this was solved by the first time `\upshape` changes `it` or `sl` back (so only `sc` remains) and second time it changes then `sc` back to normal. Maybe that’s not a bad way to handle it, but decided for a slightly different approach: `n` always returns to “normal”, ie resets everything and `up` changes italic or slanted to upright and `ulc` undoes small caps.

So we now offer `\normalshape` (using `\shapedefault` which is normally the same as calling both `\ulcshape` and `\upshape`, only more efficient.

`\ulcshape` To request going back to upper/lowercase we need a new command. It uses `ulc` as shape name but this shape is virtual, i.e., it doesn’t exist as a real shape, it is only used as part of the database table entries and thus only appears in the second argument there (but not in the first).

```

526 \DeclareRobustCommand\ulcshape
527   {\not@math@alphabet\ulcshape\relax
528    \fontshape\ulcdefault\selectfont}
529 \let\ulcdefault\@undefined      % for rollback
530 \newcommand\ulcdefault{ulc}

```

(*End definition for \ulcshape, \textulc, and \ulcdefault.*)

`\swshape` New command to select a swash shape. The standard rules put this in the same category as italics or slanted, i.e., if you ask for it then italics are undone. One could provide more complicated rules so that `it + sw` becomes `swit` but given that there are only very few fonts that have swash letters that level of flexibility (these days) would be just resulting in a lot of combinations that do not exist.

```

531 \DeclareRobustCommand\swshape
532   {\not@math@alphabet\swshape\relax
533    \fontshape\swdefault\selectfont}
534 \let\swdefault\@undefined      % for rollback
535 \newcommand\swdefault{sw}

```

(End definition for `\swshape`, `\textsw`, and `\swdefault`.)

- `\sscshape` New command to select spaced small capitals. This is only here because `fontaxes` offered it. There isn't a single free font that supports it. However, some commercial ones do, so we offer it so that at some point `fontaxes` could be retired.

So far there aren't any rules for it—probably there should be some putting it in the same category as `sc`.

```
536 \DeclareRobustCommand\sscshape
537     {\not@math@alphabet\sscshape\relax
538      \fontshape\sscdefault\selectfont}
539 \let\sscdefault\@undefined % for rollback
540 \newcommand\sscdefault{sc}
```

(End definition for `\sscshape`, `\textssc`, and `\sscdefault`.)

2.1 Mapping rules for shape combinations

Many of the entries are commented out as we will get that result without any entry.

```
541 \%{\DeclareFontShapeChangeRule {n}{n} {n} {}}
542 \DeclareFontShapeChangeRule {n}{it} {it} {sl}
543 \DeclareFontShapeChangeRule {n}{sl} {sl} {it}
544 \%{\DeclareFontShapeChangeRule {n}{sw} {sw} {}}
545 \%{\DeclareFontShapeChangeRule {n}{sc} {sc} {}}
546 \DeclareFontShapeChangeRule {n}{ulc} {n} {}
547 \DeclareFontShapeChangeRule {n}{up} {n} {}
548 \%{\DeclareFontShapeChangeRule {it}{n} {n} {}}
549 \%{\DeclareFontShapeChangeRule {it}{it} {it} {}}
550 \DeclareFontShapeChangeRule {it}{sl} {sl} {it}
551 \%{\DeclareFontShapeChangeRule {it}{sw} {sw} {}}
```

If neither `scit` nor `scls` exist then `sc` will be used as a fallback albeit with a log entry, so except for the latter there will be no change for CM or Latin Modern fonts.

```
552 \DeclareFontShapeChangeRule {it}{sc} {scit} {scls}
553 \DeclareFontShapeChangeRule {it}{ulc} {it} {}
554 \DeclareFontShapeChangeRule {it}{up} {n} {}
555 \%{\DeclareFontShapeChangeRule {sl}{n} {n} {}}
556 \DeclareFontShapeChangeRule {sl}{it} {it} {sl}
557 \%{\DeclareFontShapeChangeRule {sl}{sl} {sl} {}}
558 \%{\DeclareFontShapeChangeRule {sl}{sw} {sw} {}}
559 \DeclareFontShapeChangeRule {sl}{sc} {scls} {scit}
560 \DeclareFontShapeChangeRule {sl}{ulc} {sl} {}
561 \DeclareFontShapeChangeRule {sl}{up} {n} {}
562 \%{\DeclareFontShapeChangeRule {sc}{n} {n} {}}
563 \DeclareFontShapeChangeRule {sc}{it} {scit} {scls}
564 \DeclareFontShapeChangeRule {sc}{sl} {scls} {scit}
565 \DeclareFontShapeChangeRule {sc}{sw} {scsw} {sw}
566 \%{\DeclareFontShapeChangeRule {sc}{sc} {sc} {}}
567 \DeclareFontShapeChangeRule {sc}{ulc} {n} {}
```

The next rule might be a bit surprising and rightly so. Correct would be that `sc` is not affected by `up`, i.e., remains `sc` as showed in the commented out rule. However, for nearly three decades commands such as `sc` or `\textup` changed small caps back to the “normal” shape. So for backward compatibility we keep hat behavior.

As a result you are currently typesetting in `scit` or `scls` using `\upshape` twice will return you to the normal shape too, the first will change to `sc` and the second (because of the rule below) change that to `n`. This is the way `fontspec` implemented its version on this interface, so this rule means we are also compatible with the way `fontspec` behaved. Still it remains an oddity which I would rather liked to have avoided.

```

568 \%{\! DeclareFontShapeChangeRule {sc}{up} {sc} {}}
569 \DeclareFontShapeChangeRule {sc}{up} {n} {}
570 \%{\! DeclareFontShapeChangeRule {scit}{n} {n} {}}
571 \DeclareFontShapeChangeRule {scit}{it} {scit} {}
572 \DeclareFontShapeChangeRule {scit}{sl} {scls} {scit}
573 \DeclareFontShapeChangeRule {scit}{sw} {scsw} {sc} % or scit?
574 \DeclareFontShapeChangeRule {scit}{sc} {scit} {}
575 \DeclareFontShapeChangeRule {scit}{ulc} {it} {}
576 \DeclareFontShapeChangeRule {scit}{up} {sc} {}

```

The previous rule assumes that if `scit` exists then `it` exists as well. If not, the mechanism will save `ulc` in `\f@series` which most certainly doesn't exist. So when a font is later selected that would result in a substitution (so no harm done really). Alternatively, we could in this case use `n` as alternative, which may be a bit faster, but such a setup would be so weird in the first place that this isn't worth the effort.

```

577 \%{\! DeclareFontShapeChangeRule {scls}{n} {n} {}}
578 \DeclareFontShapeChangeRule {scls}{it} {scit} {scls}
579 \DeclareFontShapeChangeRule {scls}{sl} {scls} {}
580 \DeclareFontShapeChangeRule {scls}{sw} {scsw} {sc} % or scls?
581 \DeclareFontShapeChangeRule {scls}{sc} {scls} {}
582 \DeclareFontShapeChangeRule {scls}{ulc} {sl} {}
583 \DeclareFontShapeChangeRule {scls}{up} {sc} {}

584 \%{\! DeclareFontShapeChangeRule {scsw}{n} {n} {}}
585 \DeclareFontShapeChangeRule {scsw}{it} {scit} {scsw}

`\reserved@a` is used in `\@font@shape@subst@warning` so we have to define it in addition to do the `\ifcsname` test

```

652   \edef\reserved@a{\f@encoding / \f@family / \f@series/#1}%
653   \ifcsname \reserved@a\endcsname
654     \edef\f@shape{#1}%
655   \else
656     \ifcsname \f@encoding / \f@family / \f@series/#2\endcsname
657       \edef\f@shape{#2}%
658       \@font@shape@subst@warning
659     \else
660       \edef\f@shape{#3}%
661       \@font@shape@subst@warning
662     \fi
663   \fi
664 \fi
665 }

```

(End definition for `\merge@font@shape@.`)

`\merge@font@shape@without@substitution` See definition of `\selectfont` for how these macros are used.

```

666 \def\merge@font@shape@without@substitution#1{%
667   \expandafter\expandafter\expandafter
668   \merge@font@shape@without@substitution@
669   \csname shape@\f@shape \#1\endcsname
670   {#1}%
671   \cnil
672 }

```

```

673 \def\merge@font@shape@without@substitution@#1#2#3\cnil{%
674   \def\reserved@a{#3}%
675   \ifx\reserved@a\empty
676     \edef\f@shape{#2}%
677   \else
678     \edef\f@shape{#1}%
679   \fi
680 }

```

```

681 \let\delayed@merge@font@shape\merge@font@shape@without@substitution

```

(End definition for `\merge@font@shape@without@substitution`,
`\merge@font@shape@without@substitution@`, and `\delayed@merge@font@shape.`)

```
\normalshape \normalshape resets both sub-axes if the default rules are used.

682 \protected\def\normalshape
683   {\not@math@\alphabet\normalshape\relax
684     \fontshape\shapedefault\selectfont}%

(End definition for \normalshape.)
```

3 Make sure we win ...

This code implements one aspect of what the package `fontaxes` provide. So its redefinitions for the various shape commands, such as `\itshape` should no longer happen. We therefore force the standard definitions at `\AtBeginDocument` (later when this is defined. Once `fontaxes` is no longer doing such redefinitions that could be taken out again.

We use a separate macro so that we can easily disable this (in case of rollback).

`\reinstall@nfss@defs` I use `\protected` here not `\DeclareRobustCommand` to avoid extra status lines.

```
685 \def\reinstall@nfss@defs{%
686   \protected\def\upshape
687     {\not@math@\alphabet\upshape\relax
688       \fontshape\updefault\selectfont}%
689   \protected\def\slshape
690     {\not@math@\alphabet\slshape\relax
691       \fontshape\sldefault\selectfont}%
692   \protected\def\scshape
693     {\not@math@\alphabet\scshape\relax
694       \fontshape\scdefault\selectfont}%
695   \protected\def\itshape
696     {\not@math@\alphabet\itshape\mathit
697       \fontshape\itdefault\selectfont}%
698   \protected\def\ulcshape
699     {\not@math@\alphabet\ulcshape\relax
700       \fontshape\ulc\selectfont}%
701   \protected\def\swshape
702     {\not@math@\alphabet\swshape\relax
703       \fontshape\swdefault\selectfont}%
704   \protected\def\sscshape
705     {\not@math@\alphabet\sscshape\relax
706       \fontshape\sscdefault\selectfont}%
707 }
```

(End definition for `\reinstall@nfss@defs`.)

File x

ltfsstrc.dtx

1 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

errorshow Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the **tracefnt** package is *not* loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the **tracefnt** package is loaded.

debugshow In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output).

loading Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the **tracefnt** package became active.

pausing Turn all font warnings into errors so that L^AT_EX will stop.

2 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L^AT_EX this will produce the documentation as well.

```
1 <*driver>
2 \documentclass{ltxdoc}
3
4
5 \%OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{ltfsstrc.dtx}
9 \end{document}
10 </driver>
```

3 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11  <*package>
12  %\NeedsTeXFormat{LaTeX2e}
13  %\ProvidesPackage{tracefnt}[??/?/? v?.??
14  %
15  </package>
```

The debug module makes use of commands contained in a special package file named `trace.sty`.²⁵

```
16  <+debug> \input trace.sty
```

4 Handling Options

`\tracingfonts` Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17  <*2ekernel>
18  \def\tracingfonts{%
19    \@font@warning{Command \noexpand\tracingfonts
20      not provided.\MessageBreak
21      Use the ‘tracefnt’ package.\MessageBreak Command found:}%
22    \count@}
23 </2ekernel>
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
24  <*package,trace,debug>
25  \newcount\tracingfonts
26  \tracingfonts=0
27 </package,trace,debug>
```

(End definition for `\tracingfonts`.)

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefnt` is not loaded). `infoshow` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
28  <*package>
29  \DeclareOption{errorshow}{%
30    \def\@font@info#1{%
31      \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
32      {LaTeX Font Info: \space\space\space#1}}%
```

²⁵This package is not in distribution at the moment (and probably doesn't work any longer). Think of this part of the code as being historical artifacts.

```

33 \def\@font@warning#1{%
34   \GenericInfo{(Font)}{\spaces\spaces\space\space}%
35   { LaTeX Font Warning: #1} }%
36 }

37 \DeclareOption{warningshow}{%
38   \def\@font@info#1{%
39     \GenericInfo{(Font)}{\spaces\spaces\space\space}%
40     { LaTeX Font Info: \space\space\space#1} }%
41   \def\@font@warning#1{%
42     \GenericWarning{(Font)}{\spaces\space\space\space}%
43     { LaTeX Font Warning: #1} }%
44 }

45 \DeclareOption{infoshow}{%
46   \def\@font@info#1{%
47     \GenericWarning{(Font)}{\spaces\space\space\space}%
48     { LaTeX Font Info: \space\space\space#1} }%
49   \def\@font@warning#1{%
50     \GenericWarning{(Font)}{\spaces\space\space\space}%
51     { LaTeX Font Warning: #1} }%
52 }

53 \DeclareOption{loading}{%
54   \tracingfonts\tw@
55 }

56 \DeclareOption{debugshow}{%
57   \ExecuteOptions{infoshow}%
58   \tracingfonts\thr@@
59 }

60 \DeclareOption{pausing}{%
61   \def\@font@warning#1{%
62     \GenericError
63       {(Font)}{\spaces\space\space\space}%
64       { LaTeX Font Warning: #1} }%
65     {See the LaTeX Companion for details.}%
66     {I'll stop for every LaTeX Font Warning because
67      you requested\MessageBreak the 'pausing' option
68      to the tracefnt package.} }%
69 }

```

We make `infoshow` the default, which in turn defines `\font@warning` and `\font@info`.

```

70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 
```

We also need a default definition inside the kernel:

```

73 <*2ekernel>
74 \def\@font@info#1{%
75   \GenericInfo{(Font)}{\spaces\space\space\space}%
76   { LaTeX Font Info: \space\space\space#1} }%
77 \def\@font@warning#1{%
78   \GenericWarning{(Font)}{\space\space\space\space}%
79   { LaTeX Font Warning: #1} }%
80 
```

5 Macros common to `fam.tex` and `tracefnt.sty`

In the first versions of `tracefnt.dtx` some macros of `fam.dtx`²⁶ were redefined to included the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `ltfss.dtx`.

5.1 General font loading

- `\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the `.tfm`) as it was determined by the NFSS tables.

```
81  {*2ekernel | package}
82  \def\extract@font{%
83    \get@external@font
```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```
84    \global\expandafter\font\font@name\external@font\relax
```

When tracing we typeout the internal and external font name.

```
85  {*trace}
86    \ifnum \tracingfonts >@one
87      @font@info{External font '\external@font',
88                 loaded as\MessageBreak \font@name}\fi
89  
```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```
90  \font@name \relax
```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```
91  \csname \f@encoding+\f@family\endcsname
92  \csname\curr@fontshape\endcsname
93  \relax
94  }
95 
```

The `\relax` at the end needs to be explained. This is inserted to prevent `TeX` from scanning too far when it is executing the replacement text of the loading code macros.

(*End definition for `\extract@font`.*)

- `\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

```
96  {*2ekernel}
97  \def\get@external@font{%
```

We don’t know the external font name at the beginning.

```
98  \let\external@font\@empty
99  \edef\font@info{\expandafter\expandafter\expandafter\string
100    \csname \curr@fontshape \endcsname}%
101  \try@size@range
```

²⁶This file is currently not distributed in documented form. Its code is part of `ltfss.dtx`.

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It "knows about" `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```

102   \ifx\external@font\empty
103     \try@size@substitution
104     \ifx\external@font\empty
105       @latex@error{Font \expandafter \string\font@name\space
106                     not found}\@eha
107       \error@fontshape
108       \get@external@font
109     \fi\fi
110   }
111 
```

(End definition for `\get@external@font`.)

```

112 <*2ekernel | latexrelease | package>
113 <| latexrelease> \IncludeInRelease{2021/06/01}%
114 <| latexrelease>           {\selectfont}{Add hook to \selectfont}%

```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```

115 \DeclareRobustCommand\selectfont
116   {%

```

When `debug` is specified we actually want something like 'undebbug'. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```

117 <+debug> \pushtracing
118 <+debug> \ifnum\tracingfonts<4 \tracingoff
119 <+debug> \else \tracingon\p@selectfont \fi

```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```

120   \ifx\f@linespread\baselinestretch \else
121     \set@fontsize\baselinestretch\f@size\f@baselineskip \fi

```

The series and shape updates are only prepared by `\fontseries` and `\fontshape` but not executed until after we are ready to change the font face. This way they happen after a possibly new family is set which is important because they look at the available font faces in that family and alter the selection based on availability. Several calls to `\fontseries` or `\fontshape` are delayed in the order in which they appear, so that by switching them one can work around missing intermediate font faces and avoid substitutions.

We first attempt to do the merge without any substitution. As we might end up with a non-existing font face we may have to restart and therefore save the current values of `\f@series` and `\f@shape` before the merge.

But first we make a quick test to see if there are any delayed actions, because if not it is pointless to make all the assignments and try loading a missing fontshape.

```

122 \ifx\delayed@f@adjustment\empty
123 \else
124   \let\f@shape@saved\f@shape
125   \let\f@series@saved\f@series

```

The we run the delayed adjustments (which is using the `\...@without@substitution` commands

```
126      \delayed@f@adjustment
```

We then check if the resulting combination is valid but for this we have to make sure that the appropriate .fd is loaded if that hasn't happened so far.

```
127      \maybe@load@fontshape
128      \ifcsname \f@encoding/\f@family/\f@series/\f@shape \endcsname
```

If this macro is defined then we are good and no further action is necessary.

Otherwise the combination is not valid, so we redo the merge but this time with substitutions.

```
129      \else
130          \let\f@shape\f@shape@saved
131          \let\f@series\f@series@saved
132          \let\delayed@merge@font@shape\merge@font@shape
133          \let\delayed@merge@font@series\merge@font@series
134          \delayed@f@adjustment
135          \let\delayed@merge@font@shape\merge@font@shape@without@substitution
136          \let\delayed@merge@font@series\merge@font@series@without@substitution
137      \fi
```

Now the series and shape values are updated and we clear `\delayed@f@adjustment`. This is important because on the next execution of `\selectfont` we should not mistakenly redo the delayed actions if there wasn't any series or shape change.

```
138      \let\delayed@f@adjustment\empty
139      \fi
```

If the series was forced we should now cancel that in case the next series change is done with some low-level setting to `\f@series`.

```
140      \forced@seriesfalse
```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L^AT_EX's `\twfbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```
141      \xdef\font@name{%
142          \csname\curr@fontshape/\f@size\endcsname}%
```

We call the macro `\pickup@font` which will load the font if necessary.

```
143      \pickup@font
```

Then we select the font.

```
144      \font@name
```

After switching fonts we run a hook, so that packages can make last minute alterations based on the new font (originally provided in `everysel` but using a different interface).

```
145      \UseHook{selectfont}%
```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```
146      \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```
147     \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
148 <+debug> \poptracing
149 }
```

(End definition for `\selectfont`.)

selectfont Declare the hook used in `selecfont` in the kernel, but not inside the `tracefnt` package.

```
150 {-trace} \NewHook{selectfont}
```

(End definition for `selectfont`.)

If `\tracingfonts` is greater than 2 we also show the font switch inside `\selectfont`. We do this by adding this code to the hook in the `tracefnt` package: macro might redefine `\font@name`.

```
151 <*trace>
152 \AddToHook{selectfont}
153   {\ifnum \tracingfonts>\tw@
154     \font@info{Switching to \font@name}\fi}
155 
```

```
156 {/2ekernel | latexrelease | package}
157 \latexrelease\EndIncludeInRelease
```

With `\selectfont` having different definitions in different kernels we also have to provide them in the `tracefnt` package to support rollback. In packages that works a bit differently and therefore we have to provide an empty block there.

```
158 <package>\IncludeInRelease{2021/06/01}%
159 <package>           {\selectfont}{Add hook to \selectfont}%
160 <package>\EndIncludeInRelease

161 <latexrelease | package>\IncludeInRelease{0000/00/00}%
162 <latexrelease | package>           {\selectfont}{Add hook to \selectfont}%
163 <latexrelease | package>
164 <latexrelease | package>\DeclareRobustCommand\selectfont
165 <latexrelease | package>  {%
166   <latexrelease | package>    \ifx\f@linespread\baselinestretch \else
167   <latexrelease | package>      \set@fontsize\baselinestretch\f@size\f@baselineskip \fi
168   <latexrelease | package>    \xdef\font@name{%
169     \csname curr@fontshape/\f@size\endcsname}%
170   <latexrelease | package>    \pickup@font
171   <latexrelease | package>    \font@name
172   <latexrelease | package>    \size@update
173   <latexrelease | package>    \enc@update
174   <latexrelease | package>  }
175 <latexrelease | package>
176 <latexrelease | package>\EndIncludeInRelease
```

\set@fontsize The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```
177 <*2ekernel | package>
178 \def\set@fontsize#1#2#3{%
179   \Qdefaultunits\Qtempdimb#2pt\relax\Qnil
```

```

180   \edef\f@size{\strip@pt\@tempdimb}%
181   \@defaultunits\@tempskipa#3pt\relax\@nnil
182   \edef\f@baselineskip{\the\@tempskipa}%
183   \edef\f@linespread{\#1}%

```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```
184   \let\baselinestretch\f@linespread
```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```
185   \def\size@update{%
```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```

186   \baselineskip\f@baselineskip\relax
187   \baselineskip\f@linespread\baselineskip
188   \normalbaselineskip\baselineskip

```

then to set up a new `\strutbox`

```

189   \setbox\strutbox\hbox{%
190     \vrule\@height.7\baselineskip
191     \@depth.3\baselineskip
192     \@width\z@}%

```

We end with a bit of tracing information.

```

193  <*>
194  \ifnum \tracingfonts>\tw@
195    \ifx\f@linespread\empty
196      \let\reserved@a\empty
197    \else
198      \def\reserved@a{\f@linespread x}%
199    \fi
200    \font@info{Changing size to \f@size/\reserved@a
201      \f@baselineskip}%
202    \aftergroup\type@restoreinfo \fi
203 </>

```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```

204   \let\size@update\relax}%
205 }

```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let!`

(End definition for `\set@fontsize`.)

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
206 \let\size@update\relax
```

(End definition for `\size@update`.)

`\type@restoreinfo` This macro produces some info when a font size and/or baseline change will get restored.

```
207  {*trace}
208  \def\type@restoreinfo{%
209    \ifx\f@linespread\empty
210      \let\reserved@a\empty
211    \else
212      \def\reserved@a{\f@linespread x}%
213    \fi
214    \font@info{Restoring size to
215      \f@size/\reserved@a\f@baselineskip}%
216 }
```

(End definition for `\type@restoreinfo`.)

`\glb@settings` The macro `\glb@settings` globally selects all math fonts for the current size if necessary.
`\glb@currsize` `\def\glb@settings{%`

When `\glb@settings` gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to `\math@fonts`. But this happens only if the `math@fonts` switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the `S@...` macro is not defined we have to first calculate the three sizes.

```
218  \expandafter\ifx\csname S@\f@size\endcsname\relax
219  \calculate@math@sizes
220  \fi
```

The effect of this is that `\calculate@math@sizes` may or may not define the `S@...` macro. In the first case the next time the same size is requested this macro is used, otherwise `\calculate@math@sizes` is called again. This also sets the `math@fonts` switch. If it is true we must switch the math fonts.

```
221  \csname S@\f@size\endcsname
222  \ifmath@fonts
223  {*trace}
224  \ifnum \tracingfonts>\tw@
225  \font@info{Setting up math fonts for
226  \f@size/\f@baselineskip}\fi
227 }
```

Inside a group we execute the macro for the current math *version*. This sets `\math@fonts` to a list of `\textfont...` assignments. `\getanddefine@fonts` (which may be called at this point) needs the `\escapechar` parameter to be set to `-1`.

```
228  \begingroup
229  \escapechar\m@ne
230  \csname mv@\math@version \endcsname
```

Then we set `\globaldefs` to 1 so that all following changes are done globally. The math font assignments recorded in `\math@fonts` are executed and `\glb@currsize` is set equal to `\f@size`. This signals that the fonts for math in this size are set up.

```
231  \globaldefs\@ne
232  \math@fonts
```

```

233      \let \glb@currsize \f@size
234      \endgroup

```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within `\globaldefs\one` as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```

235      \the\every@math@size

```

Otherwise we announce that the math fonts are not set up for this size.

```

236  {*trace}
237      \else
238          \ifnum \tracingfonts>\tw@
239              \font@info{No math setup for
240                  \f@size/\f@baselineskip}\fi
241  
```

```

242      \fi
243  }
244  
```

(End definition for `\glb@settings` and `\glb@currsize`.)

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```

245  
```

```

246  \def\baselinestretch{1}

```

(End definition for `\baselinestretch`.)

`\every@math@size` We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```

247  \newtoks\every@math@size
248  \every@math@size={}
249  
```

(End definition for `\every@math@size`.)

5.2 Math fonts setup

5.2.1 Outline of algorithm for math font sizes

TeX uses the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

```
$ a=b+c \mbox{ \small for all } b \text{ and } c \text{ in } Z }
```

Here the inner formulae `b` and `c\in Z` are typeset in `\small` but we have to return to `\normalsize` before we reach the closing `$` of the outer formula.

This is handled in the following way:

- At any point in the document the global variable `\glb@currsize` contains the point size for which the math fonts currently are set up.

2. Whenever we start a formula we compare its value with the local variable `\f@size` that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call `\gbl@settings` which changes the math font setup and updates `\gbl@currsize`.
 - (a) If we are recursively inside another formula (`\if@inmath`) we ensure that `\gbl@settings` is executed again in the outer formula, so that the old setup is automatically restored.
 - (b) Otherwise, we set the switch `@inmath` locally to `true` so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
 - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
 - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of `\aftergroup` commands and checks. Compared to the original algorithm this involves additional checks ($2 \times \langle \text{non-math levels} \rangle$ per inner formula).

5.2.2 Code for math font size setting

`\check@mathfonts` In the `\check@mathfonts` macros we implement the steps 2 to 4 except that instead of a switch the macro `\init@restore@glb@settings` is used.

```

250  {*2ekernel | package}
251  \def\check@mathfonts{%
252    \ifx \gbl@currsize \f@size
253    {*trace}
254      \ifnum \tracingfonts>\thr@@
255        \o@font@info{*** MATH: no change \f@size\space
256          curr/global (\curr@math@size/\gbl@currsize)}\fi
257    
```

`(*trace)`

```

258    \else
259    
```

`(*trace)`

```

260      \ifnum \tracingfonts>\thr@@
261        \o@font@info{*** MATH: setting up \f@size\space
262          curr/global (\curr@math@size/\gbl@currsize)}\fi
263  
```

```

264     \glb@settings
265     \init@restore@glb@settings
266   \fi
267   \let\curr@math@size\f@size
268   \def\init@restore@glb@settings{\aftergroup\restglb@settings}%
269 }

(End definition for \check@mathfonts.)
```

- \init@restore@glb@settings This macros does by default nothing but get redefined inside \check@mathfonts to initiate fontsize restoring in nested formulas.
- ```

270 <-trace> \let\init@restore@glb@settings\relax
271 <*trace>
272 \def\init@restore@glb@settings{%
273 \ifnum \tracingfonts>\thr@@
274 \o@font@info{*** MATH: no resetting (not in
275 nested math)}\fi
276 }
277 </trace>

(End definition for \init@restore@glb@settings.)
```

- \restglb@settings This macro will be executed the first time after the current formula.

```

278 \def\restglb@settings{%
279 <*trace>
280 \ifnum \tracingfonts>\thr@@
281 \o@font@info{*** MATH: restoring}\fi
282 </trace>
283 \begingroup
284 \let\f@size\curr@math@size
285 \ifx\glb@currsize\f@size
286 <*trace>
287 \ifnum \tracingfonts>\thr@@
288 \o@font@info{*** MATH: ... already okay (\f@size)}\fi
289 </trace>
290 \else
291 <*trace>
292 \ifnum \tracingfonts>\thr@@
293 \o@font@info{*** MATH: ... to \f@size}\fi
294 </trace>
295 \glb@settings
296 \fi
297 \endgroup
298 }
```

(End definition for \restglb@settings.)

### 5.2.3 Other code for math

- \use@mathgroup The \use@mathgroup macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```
299 \def\use@mathgroup#1#2{\relax\ifmmode
```

```

300 {*trace}
301 \ifnum \tracingfonts>\tw@
302 \count@#2\relax
303 \@font@info{Using \noexpand\mathgroup
304 (\the\count@) #2}\fi
305
```

If so we first call the ‘=’ macro (i.e. argument three) to set up special things for the selected math group. Then we call `\mathgroup` to select the group given by argument two and finally we place #1 (i.e. the argument of the *math alphabet identifier*) at the end. This part of the code is surrounded by two commands which behave like `\begingroup` and `\endgroup` if we want *math alphabet identifier*s but will expand into `\empty` if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a `\relax`. Otherwise something like `\mit{1}` would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

306 \math@bgroup
307 \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
308 #1\fi
309 \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the *math alphabet identifier* isn’t called in math mode, we remove the `\fi` with the `\expandafter` trick. This is necessary if the token is actually an macro with arguments. In such a case the `\fi` will be misinterpreted as the first argument which would be disastrous.

```
310 \expandafter\math@egroup\fi}%

```

The surrounding macros equal `\begingroup` and `\endgroup`. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in *AMS-T<sub>E</sub>X* macros for placing accents.

(End definition for `\use@mathgroup`.)

`\math@egroup` If the `margid` option is in force (which can be tested by looking at the definition of `\math@bgroup` we change the `\math@egroup` command a bit to display the current *math group number* after it closes the scope of *math alphabet* with `\endgroup`.

```

311 {*trace}
312 \ifx\math@bgroup\bgroup
313 \def\math@egroup#1{\egroup
314 \ifnum \tracingfonts>\tw@
315 \@font@info{Restoring \noexpand\mathgroup
316 (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
317 }\fi}
318 \fi
319
```

(End definition for `\math@egroup`.)

`\getanddefine@fonts` `\getanddefine@fonts` has two arguments: the *math group number* and the *family/series/shape* name as a control sequence.

```
320 \def\getanddefine@fonts#1#2{%

```

First we turn of tracing when `\tracingfonts` is less than 4.

```

321 <+debug> \pushtracing
322 <+debug> \ifnum\tracingfonts<4 \tracingoff
323 <+debug> \else \tracingon\getanddefine@fonts \fi

```

```

324 {*trace}
325 \ifnum \tracingfonts>\tw@
326 \count@#1\relax
327 \@font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
328 \string#2 \tf@size/\sf@size/\ssf@size}\fi
329
```

We append the current `\tf@size` to #2 to obtain the font name.<sup>27</sup> Again, `font@name` is defined globally, for the reasons explained in the description of `\wrong@fontshape`.

```

330 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%

```

Then we call `\pickup@font` to load it if necessary. We remember the internal name as `\textfont@name`.

```

331 \pickup@font \let\textfont@name\font@name

```

Same game for `\scriptfont` and `\scriptscriptfont`:

```

332 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
333 \pickup@font \let\scriptfont@name\font@name
334 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
335 \pickup@font

```

Then we append the new `\textfont...` assignments to the `\math@fonts`.

```

336 \edef\math@fonts{\math@fonts
337 \textfont#1\textfont@name
338 \scriptfont#1\scriptfont@name
339 \scriptscriptfont#1\font@name}%

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

340 (+debug) \poptracing
341 }
342
```

*(End definition for `\getanddefine@fonts`.)*

## 6 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\gobble` which discards the following argument, otherwise it expands to `\firstofone` which reproduces its argument.

```

343 {*2ekernel}
344 \def\ifnot@nil#1{\def\reserved@a{#1}%
345 \ifx\reserved@a\@nil \expandafter\gobble
346 \else \expandafter\firstofone\fi}

```

*(End definition for `\ifnot@nil`.)*

`\remove@to@nnil` Three other auxiliary macros will be needed in the following: `\remove@to@nnil` gobbles up everything up to, and including, the next `\@nnil` token, and `\remove@angles` and `\remove@star` do the same for the character `>` and `*`, respectively, instead of `\@nnil`.

```

347 \def\remove@to@nnil#1\@nnil{#1}
348 \def\remove@angles#1>{\set@simple@size@args{#1}}
349 \def\remove@star#1*{#1}

```

---

<sup>27</sup>One might ask why this expansion does not generate a macro name that starts with an additional `\` character. The solution is that `\escapechar` is set to `-1` before `\getanddefine@fonts` is called.

(End definition for `\remove@to@nnil`, `\remove@angles`, and `\remove@star`.)

- `\extract@sizefn` This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
350 \def\extract@sizefn#1#2\@nil{%
351 \if>#2>\set@size@funct@args#1\@nil
352 \let\sizefn@info\empty
353 \else\expandafter\set@size@funct@args\remove@star#2\@nil
354 \def\sizefn@info{#1}\fi
355 }
```

(End definition for `\extract@sizefn`.)

- `\try@simple@size` This function tries to extract the given size (specified by `\f@size`) for the requested font shape. The font information must already be present in `\font@info`. The central macro that does the real work is `\extract@fontinfo`. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The corresponding font definitions have already been extracted from the macro `\OT1/cm/sansserif/normal` and stored in `font@info`. (Otherwise `\extract@fontinfo` doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro `\extract@fontinfo` to find the external font name (‘cmss12’) for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
 \set@simple@size@args#3<#4\@nnil
 \execute@size@function{#2}}
```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nnil
```

#1 will contain all characters before `<12*>`, #2 will be empty, #3 will be exactly `cmss12`, and #3 will be `17>cmss17`. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument set to empty and its mandatory argument set to `cmss12` by `\set@simple@size@args`. As we discussed earlier, the effect of the default size function is to load the given external font (`cmss12`) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list `\font@info`. And the simple definition of `\extract@fontinfo` we gave above does not allow to specify give more than one size specification in front of the external font name.

Let’s address these two problems separately. The first one is solved with the following trick: We define `\extract@fontinfo` as follows:

```
\def\extract@fontinfo#1<#2>#3<#4\@nnil{%
 \ifnot@nil{#3}%
 {\set@simple@size@args#3<#4\@nnil
 \execute@size@function{#2}%
 }%
}
```

How does this work? We call `\extract@fontinfo` via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil
```

i.e. by appending `<12*>\@nil<\@nnil`. If the size ('12' in this case) appears in `\font@info` everything works as explained above, the only difference being that argument #4 of `\extract@fontinfo` additionally gets the tokens `<12*>\@nil<\@nnil`. However, if the size is not found everything up to the final `<12*>` is in argument #1, #3 gets `\@nil`, and #2 and #4 are empty. The macro `\ifnot@nil` will discard the calls to `\set@simple@size@args` and `\execute@size@function`, and hence `\font@info` will continue to be equal to `\@empty`. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in `\set@simple@size@args` below.

The macros are hidden inside other control sequences so that we have to build `\extract@fontinfo` in several steps.

So here's the actual definition of `\extract@font` in `\try@simple@size`.

```
356 % % this could be replaced by \try@size@range making the subst slower!
357 \def\try@simple@size{%
```

`\reserved@a` is made an abbreviation for the head of the definition of the macro `\extract@fontinfo`.

```
358 \def\reserved@a{\def\extract@fontinfo####1}{%
```

Now we can define `\extract@fontinfo`. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the \* character.

```
359 \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nnil{%
360 \ifnot@nil{##2}%
361 {\set@simple@size@args##2<##3\@nnil
362 \execute@size@function\sizefn@info
363 }%
}
```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```
364 \expandafter\expandafter
365 \expandafter\extract@fontinfo\expandafter\font@info
366 \expandafter<\f@size>\@nil<\@nnil
367 }
```

(End definition for `\try@simple@size`.)

`\set@simple@size@args` As promised above, the macro `\set@simple@size@args` will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character <. By starting the definition as follows,

```
368 \def\set@simple@size@args#1<%
```

parameter #1 is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character < cannot appear in #1) by calling `\remove@angles` for empty #1 and `\extract@sizefn` otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by `\remove@to@nnil`. Note also the use of Kabelschacht's method.

```

369 \if<#1<%
370 \expandafter\remove@angles
371 \else
372 \extract@sizefn#1*\@nil
373 \expandafter\remove@to@nnil
374 \fi}

```

*(End definition for `\set@simple@size@args`.)*

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macros for extraction of size range specification.

`\extract@rangefontinfo` `\extract@rangefontinfo` goes through a font shape definition in the input until it recognizes the tokens <\@nil->. It looks for font ranges with font size functions. Its operation is rather simple: it discards everything up to the next size specification and passes this on to `\is@range` for inspection. The specification (parameter #2 is inserted again, in case it is needed later.

```

375 \def\extract@rangefontinfo#1<#2>{%
376 \is@range#2->\@nil#2}

```

*(End definition for `\extract@rangefontinfo`.)*

`\is@range` `\is@range` is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls `\extract@rangefontinfo` to continue the search. Otherwise it calls `\check@range` to check the requested size against the specified range.

From the way `\is@range` is called inside `\extract@rangefontinfo` we see that #2 is the character > if the size specification found is a simple one (as it does not contain a - character. This is checked easily enough and `\extract@rangefontinfo` called again. Note that the extra tokens inserted after the `\@nil` in the call to `\is@range` appear at the beginning of the first argument to `\extract@rangefontinfo` and are hence ignored.

```

377 \def\is@range#1-#2\@nil{%
378 \if>#2\expandafter\check@singl\else
379 \expandafter\check@range\fi}

```

*(End definition for `\is@range`.)*

`\check@range` `\check@range` takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token `\@nil \font@info` is exhausted and we can stop searching.

```

380 \def\check@range#1-#2>#3<#4\@nil{%
381 \ifnot@nil{#3}{%

```

If #3 wasn't `\@nil` we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```

382 \def\reserved@ff{\extract@rangefontinfo<#4\@nil}%

```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If `\upper@bound` is zero after the assignment we set it to `\maxdimen` (upper open range). We need to use a  $\langle dimen \rangle$  register for the scan since we may have a decimal number as the boundary.

```
383 \upper@bound0#2\p@
384 \ifdim\upper@bound=\z@ \upper@bound\maxdimen\fi
```

Now we check the upper boundary against `\f@size`. If it is larger or equal than `\f@size` this range is no good and we have to recurse.

```
385 \ifdim \f@size \p@<\upper@bound
```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in 1pt as default lower boundary. If `\f@size` is smaller than the boundary we have to recurse.

```
386 \lower@bound0#1\p@
387 \ifdim \f@size \p@<\lower@bound
388 \else
```

If both tests are passed we can try executing the size function.

```
389 \set@simple@size@args#3<#4\@nnil
390 \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
391 \ifx\external@font\@empty
392 \else
393 \let\reserved@f\@empty
394 \fi
395 \fi
396 \fi
397 \reserved@f}}
```

(End definition for `\check@range`.)

`\lower@bound` We use two dimen registers `\lower@bound` and `\upper@bound` to store the lower and upper endpoints of the range we found.

```
398 \newdimen\lower@bound
399 \newdimen\upper@bound
```

(End definition for `\lower@bound` and `\upper@bound`.)

`\check@single` `\check@single` takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
400 \def\check@single#1>#2<#3\@nnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
401 \def\reserved@f{\extract@fontinfo<#3\@nnil}{%
```

Now we check the size against `\f@size`. If it is not equal `\f@size` it is no good and we have to recurse.

```
402 \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
403 \set@size@args#2<#3\@nil
404 \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
405 \ifx\external@font\@empty
406 \else
407 \let\reserved@f\@empty
408 \fi
409 \fi
410 \reserved@f}
```

(End definition for `\check@single`.)

`\set@size@funct@args` This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token `\@nil`.

```
411 \def\set@size@funct@args{\@ifnextchar[%]
412 \set@size@funct@args{\set@size@funct@args[]}}
413 \def\set@size@funct@args[#1]#2\@nil{%
414 \def\mandatory@arg{#2}%
415 \def\optional@arg{#1}%
416 }/{2ekernel}
```

(End definition for `\set@size@funct@args` and `\set@size@funct@args@`.)

`\DeclareSizeFunction` This function defines a new size function hiding the internal from the designer. The body of the size function may use `\optional@arg` and `\mandatory@arg` denoting the optional and mandatory argument that may follow the size specification `<...>`.

```
417 {*}2ekernel}
418 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
419 \@onlypreamble\DeclareSizeFunction
420 }/{2ekernel}
```

(End definition for `\DeclareSizeFunction`.)

`\execute@size@function` This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a `\relax`).

```
421 {*}2ekernel | package)
422 \def\execute@size@function#1{%
423 {*trace}
424 \@ifundefined{s@fct@#1}{%
425 {\errmessage{Undefined font size function #1}%
426 \s@fct@}%
427 {\csname s@fct@#1\endcsname}%
428 }/{trace}
429 {-trace} \csname s@fct@#1\endcsname
430 }
431 }/{2ekernel | package}
```

(End definition for `\execute@size@function`.)

\try@size@range This macro tries to find a suitable range for requested size (specified by \f@size) in \font@info. All the relevant action is done in \extract@rangefontinfo. All that needs to be done is to stuff in the token list in \font@info so that \extract@rangefontinfo can inspect it. Note the <-\*\@nil> token at the end to stop scanning.

```

432 {*2ekernel}
433 \def\try@size@range{%
434 \expandafter\extract@rangefontinfo\font@info <-*>\@nil<\@nnil
435 }

```

(End definition for \try@size@range.)

\try@size@substitution This is the last thing that can be tried. If the desired \f@size is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```
436 \gdef\try@size@substitution{%
```

First we do some initializations. \tempdimb will hold the difference between the wanted size and the best solution found so far, so we initialise it with \maxdimen. The macro \best@size will hold the best size found, nothing found is indicated by the empty value.

```

437 \tempdimb \maxdimen
438 \let \best@size \empty

```

Now we loop over the specification

```

439 \expandafter \try@simples \font@info <\number\@M\@nil<\@nnil
440 }

```

(End definition for \try@size@substitution.)

\font@submax \fontsubfuzz The macro \font@submax records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at \end{document}. The macro \fontsubfuzz contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```

441 \def\font@submax{0pt}
442 \def\fontsubfuzz{.4pt}
443 {/2ekernel}
444 {+package}\def\fontsubfuzz{0pt}

```

(End definition for \font@submax and \fontsubfuzz.)

\try@simples \try@simples goes through a font shape definition in the input until it recognizes the tokens <\*\@nil>. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```

445 {*2ekernel}
446 \gdef\try@simples#1<#2>{%
447 \tryif@simple#2->\tryif@simple}

```

(End definition for \try@simples.)

\tryis@simple \tryis@simple is similar to \is@range. If it sees a simple size, it checks it against the value of \f@size and sets \lower@font@size or \higher@font@size. In the latter case, it stops the iteration. By adding <\number\@M> at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```
448 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for `\reserved@f` first:

```
449 \let \reserved@f \try@simples
450 \if>#2%
```

If so, it compares it to the value of `\f@size`. This is done using a dimen register since there may be fractional numbers.

```
451 \dimen@ #1\p@
452 \ifdim \dimen@<\OM\p@
```

If `\dimen@` is `\OM\p@` we have reached the end of the fontspec (hopefully) otherwise we compare the value with `\f@size` and compute in `\@tempdimc` the absolute value of the difference between the two values.

```
453 \ifdim \f@size\p@<\dimen@
454 \@tempdimc \dimen@
455 \advance\@tempdimc -\f@size\p@
456 \else
457 \@tempdimc \f@size\p@
458 \advance\@tempdimc -\dimen@
459 \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in `\@tempdimc` is smaller) we have found a size which is a better approximation so we make it the `\best@size` and adjust `\@tempdimb`.

```
460 \ifdim \@tempdimc<\@tempdimb
461 \@tempdimb \@tempdimc
462 \def \best@size{#1}%
463 \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called `\subst@size`.

```
464 \else
```

This macro substitutes the size recorded in `\best@size` for the unavailable size `\f@size`. `\font@submax` records the maximum difference between desired size and selected size in the whole run.

```
465 % %\subst@size %% coded inline
466 % %\def\subst@size{%
467 \ifx \external@font\empty
468 \ifx \best@size\empty
469 \else
470 \ifdim \@tempdimb>\font@submax \relax
471 \xdef \font@submax {\the\@tempdimb}%
472 \fi
473 \let \f@user@size \f@size
474 \let \f@size \best@size
475 \ifdim \@tempdimb>\fontsubfuzz\relax
476 \font@warning{Font\space shape\space
477 '\curr@fontshape'\space in\space size\space
478 <\f@user@size>\space not\space available\MessageBreak
479 size\space <\f@size>\space substituted}%
480 \fi
481 \try@simple@size
482 \do@subst@correction
```

```

483 \fi
484 \fi
485 % %}

```

This brings us back into the main part of `\tryif@simple`. Finally we get rid of any rubbish left over on the input stack.

```

486 \let \reserved@f \remove@to@nnil
487 \fi
488 \fi

```

If it's a range iterate also.

```
489 \reserved@f}
```

(End definition for `\tryis@simple` and `\subst@size`.)

## 6.1 Sizefunctions

In the following we define some useful size functions.

- `\s@fct@` This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

490 \DeclareSizeFunction{}{\empty@sfcnt\@font@warning}
491 \DeclareSizeFunction{s}{\empty@sfcnt\@font@info}

492 \def\empty@sfcnt#1{%
493 \tempdimb \f@size\p@
494 \ifx\optional@arg\empty
495 \else
496 \tempdimb \optional@arg\tempdimb
497 #1{Font}space shape\space '\curr@fontshape'\space
498 will\space be\MessageBreak
499 scaled\space to\space size\space \the\tempdimb}%
500 \fi
501 \edef\external@font{\mandatory@arg\space at\the\tempdimb}}

```

(End definition for `\s@fct@`.)

- `\s@fct@gen` `\s@fct@sgen` This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

502 \DeclareSizeFunction{gen}{\gen@sfcnt\@font@warning}
503 \DeclareSizeFunction{sgen}{\gen@sfcnt\@font@info}

504 \def\gen@sfcnt{%
505 \edef\mandatory@arg{\mandatory@arg\f@size}%
506 \empty@sfcnt}

```

(End definition for `\s@fct@gen` and `\s@fct@sgen`.)

\s@fct@genb This size function is similar to `gen`, but for fonts where the size is encoded in the font name in centipoins, as in the DC fonts version 1.2. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

507 \DeclareSizeFunction{genb}{\genb@sfcnt\@font@warning}
508 \DeclareSizeFunction{sgenb}{\genb@sfcnt\@font@info}
509 \def\genb@sfcnt{%
510 \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@0}%
511 \empty@sfcnt}

```

(End definition for `\s@fct@genb` and `\s@fct@sgenb`.)

\genb@x The auxiliary macros `\genb@x` and `\genb@y` are used to convert the `\f@size` into centi-points.

```

512 \def\genb@x#1.#2.#3{\two@digits{#1}\genb@y#200\@0}
513 \def\genb@y#1#2#3{\@0{#1#2}}

```

(End definition for `\genb@x` and `\genb@y`.)

\s@fct@sub This size function handles font substitution. The mandatory argument is a family/series/shape combination, the optional argument (if present) is ignored. The font encoding scheme cannot be changed. Therefore, the first thing we do is to prepend the encoding scheme.

```

514 \DeclareSizeFunction{sub}{\sub@sfcnt\@font@warning}
515 \DeclareSizeFunction{ssub}{\sub@sfcnt\@font@info}
516 \def\sub@sfcnt#1{%
517 \edef\mandatory@arg{\f@encoding\mandatory@arg}%

```

Next action is split the arg into its individual components and allow for a late font shape load.

```

518 \begingroup
519 \expandafter\split@name\mandatory@arg/\@nil
520 \try@load@fontshape
521 \endgroup

```

Then we record the current `\f@size` since it may get clobbered.

```
522 \let\f@user@size\f@size
```

Then we check whether this new combination is defined and give an error message if not. In this case we also switch to `\error@fontshape`.

```

523 \expandafter
524 \ifx\csname\mandatory@arg\endcsname\relax
525 \errmessage{No\space declaration\space for\space
526 shape\space \mandatory@arg}%
527 \error@fontshape
528 \else

```

Otherwise we warn the user about the substitution taking place.

```

529 #1{Font\space shape\space '\curr@fontshape'\space in\space
530 size\space <\f@size>\space not\space available\MessageBreak
531 Font\space shape\space '\mandatory@arg'\space tried\space
532 instead}%
533 \expandafter\split@name\mandatory@arg/\@nil
534 \fi

```

Then we restart the font specification scan by calling `\get@external@font`.

```
535 \edef\f@size{\f@user@size}%
536 \get@external@font
```

Finally `\do@subst@correction` is called to get the font name right.

```
537 \do@subst@correction
538 }
```

(*End definition for \s@fct@sub.*)

- `\@font@aliasinfo` Sometimes a substitution is only done to map a long font name to a standard shape or series, e.g.,

```
DeclareFontShape{T1}{Roboto-LF}{b}{it}{<-> alias * Roboto-LF/bold/it}{}
```

Using the `ssub` function in that case will give a strange (and incorrect) warning. As an alternative we therefore offer the size function `alias`. It will still add some info into the `.log` file, but no longer complains that the font shape is not available. It is implemented by grabbing the default warning text and replacing it with a new one.

```
539 </2ekernel>
540 <*2ekernel | latexrelease>
541 <latexrelease>\IncludeInRelease{2020/02/02}%
542 <latexrelease> {\@font@aliasinfo}{alias size function}%
543 \DeclareSizeFunction{alias}{\sub@sfcnt@\font@aliasinfo}
544 \def@\font@aliasinfo#1{%
545 \@font@info{Font\space shape\space ‘\curr@fontshape’\space
546 aliased\space to\MessageBreak ‘\mandatory@arg’}%
547 }
548 </2ekernel | latexrelease>
549 <latexrelease>\EndIncludeInRelease
550 <latexrelease>\IncludeInRelease{0000/00/00}%
551 <latexrelease> {\@font@aliasinfo}{alias size function}%
552 <latexrelease>\let\s@fct@alias@\undefined
553 <latexrelease>\let@\font@aliasinfo@\undefined
554 <latexrelease>
555 <latexrelease>\EndIncludeInRelease
556 <*2ekernel>
```

(*End definition for \@font@aliasinfo.*)

- `\s@fct@subf` The `subf` size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
557 \DeclareSizeFunction{subf}{\sub@sfcnt@\font@warning}
558 \DeclareSizeFunction{ssubf}{\subf@sfcnt@\font@info}

559 \def\subf@sfcnt#1{%
560 #1{Font\space shape\space ‘\curr@fontshape’\space in\space
561 size\space f@size\space not\space available\MessageBreak
562 external\space font\space ‘\mandatory@arg’\space used}%
563 \empty@sfcnt#1%
564 }
```

(*End definition for \s@fct@subf.*)

- \s@fct@fixed The **fixed** size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```

565 \DeclareSizeFunction{fixed}{\fixed@sfcnt\@font@warning}
566 \DeclareSizeFunction{sfixed}{\fixed@sfcnt\@font@info}
567 \def\fixed@sfcnt#1{%
568 \ifx\optional@arg\empty
569 \let\external@font\mandatory@arg
570 \else
571 \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
572 \fi
573 #1{External\space font\space '\external@font'\space loaded\space
574 for\space size\MessageBreak
575 <\f@size>}%
576 }
577
```

(End definition for \s@fct@fixed.)

## File y

# ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original ‘NFSS1’ release of the Font Selection Scheme.

**Warning:** The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was “current” only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via `latexrelease` package so that backward compatibility remains ensured for very old documents.

```
1 {*latexrelease}
2 \IncludeInRelease{2015/01/01}{\new@fontshape}%
3 {NFSS version1 commands}%
4 \let\new@fontshape@undefined
5 \let\warn@rel@i@undefined
6 \let\scan@fontshape@undefined
7 \let\scan@@fontshape@undefined
8 \let\subst@fontshape@undefined
9 \let\extra@def@undefined
10 \let\default@mextra@undefined
11 \let\preload@sizes@undefined
12 \let\err@rel@i@undefined
13 \let\newmathalphabet@undefined
14 \let\newmathalphabet@undefined
15 \let\newmathalphabet@@@@undefined
16 \let\if@no@font@opt@undefined
17 \let\@no@font@opt@false@undefined
18 \let\define@mathalphabet@undefined
19 \let\define@mathgroup@undefined
20 \let\addtoversion@undefined
21 \EndIncludeInRelease
```

In older releases we provide the original definitions.

```
22 \IncludeInRelease{0000/00/00}{\new@fontshape}%
23 {NFSS version1 commands}%
```

`\new@fontshape` The interface is now `\DeclareFontShape`.

```
24 \gdef\new@fontshape#1#2#3#4{%
25 \warn@rel@i\new@fontshape\DeclareFontShape
26 \expandafter\scan@fontshape\@gobble#4<\@nil><<%
27 \DeclareFontShape U{#1}{#2}{#3}\reserved@f}%
28 \onlypreamble\new@fontshape
```

(*End definition for `\new@fontshape`.*)

`\warn@rel@i` The warning message used above.

```
29 \gdef\warn@rel@i#1#2{%
30 \font@warning{*** NFSS release 1 command}
```

```

31 \noexpand#1found\MessageBreak
32 *** Update by using release 2 command
33 \string#2.\MessageBreak
34 *** Recovery is probably possible}%
35 }%
36 \onlypreamble\warn@rel@i

```

(End definition for \warn@rel@i.)

\scan@fontshape This will scan the old font shape definition syntax.

```

37 \gdef\scan@fontshape{%
38 \let\reserved@f\empty
39 \let\reserved@e\empty % holds last info
40 \scan@@fontshape
41 }%
42 \onlypreamble\scan@fontshape

```

(End definition for \scan@fontshape.)

\scan@@fontshape

```

43 \gdef\scan@@fontshape#1>#2#3<%

```

```

75 \fi
76 \expandafter\scan@@fontshape
77 \fi
78 }%
79 \onlypreamble\scan@@fontshape

```

(End definition for `\scan@@fontshape`.)

`\subst@fontshape` This is now also handled by the extend syntax of `\DeclareFontShape`.

```

80 \gdef\subst@fontshape#1#2#3#4#5#6{%
81 \warn@rel@i\subst@fontshape\DeclareFontShape
82 \DeclareFontShape{U}{#1}{#2}{#3}{<->sub*#4/#5/#6}{()}%
83 \onlypreamble\subst@fontshape

```

(End definition for `\subst@fontshape`.)

`\extra@def` This was replaced by `\DeclareFontFamily`.

```

84 \gdef\extra@def#1#2#3{%
85 \warn@rel@i\extra@def\DeclareFontFamily
86 \DeclareFontFamily{U}{#1}{()}%
87 }%
88 \onlypreamble\extra@def

```

(End definition for `\extra@def`.)

`\default@mextra` The new name is `\DeclareFontEncodingDefaults` but in this case we don't feel comfortable with this either.

```

89 \gdef\default@mextra{%
90 \warn@rel@i\default@mextra\DeclareFontEncodingDefaults

```

We pick up the argument to `\default@mextra` implicitly as the second argument of `\DeclareFontEncodingDefaults`.

```

91 \DeclareFontEncodingDefaults\relax
92 }%
93 \onlypreamble\default@mextra

```

(End definition for `\default@mextra`.)

`\preload@sizes` The new interface is `\DeclarePreloadSizes`.

```

94 \gdef\preload@sizes{%
95 \warn@rel@i\preload@sizes\DeclarePreloadSizes
96 \DeclarePreloadSizes U%
97 }%
98 \onlypreamble\preload@sizes

```

(End definition for `\preload@sizes`.)

`\err@rel@i` This macro is used in cases where emulation with NFSS2 features is not really possible.

```

99 \gdef\err@rel@i#1#2{%
100 \o@late@error{*** NFSS release 1 command \noexpand#1found%
101 ^^J*** Recovery not possible. Use \string#2}%

# File z

## ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of these commands.

**Warning:** The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

### 1 Interface Commands

\in@ \in is a utility macro with two arguments. It determines whether its first argument \ifin@ occurs in its second and sets the switch \ifin@ accordingly. The first argument may not contain braces nor # (more precisely, tokens of category code 1, 2, or 6).

```
1 {*2ekernel}
2 \def\in@#1#2%
3 {%
4 \begingroup
5 \def\in@@##1#1{%
6 \toks@\expandafter{\in@@#2{}{}#1}%
7 \edef\in@{\the\toks@}%

9 \ifx\in@{\emptyset}
10 \in@false
11 \else
12 \in@true
13 \fi
14 }
15 \newif\ifin@
```

(End definition for \in@ and \ifin@.)

Before the \begin{document} command several *math versions* and *math alphabet identifiers* may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

- the list of all math versions, \version@list, each entry prefixed by the control sequence \version@elt, i.e. this list has the following form

$$\text{\version@elt}\langle\text{version}_1\rangle\text{\version@elt}\langle\text{version}_2\rangle\dots\text{\version@elt}\langle\text{version}_n\rangle$$

- the list of all math alphabet identifiers. Here every entry has the form:

$$\text{\group@elt}\langle\text{math group number}\rangle\\ \{\{\langle\text{default family}\rangle\}\{\langle\text{default series}\rangle\}\{\langle\text{default shape}\rangle\}\}.$$

- Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

```
\set@alpha<the alphabet identifier itself>
\reserved@c<math version>
...
\@nil
```

where  $\langle font\ info\rangle$  is either  $\reserved@e$  (if the combination is not defined yet) or  
 $\{\{family\}\}\{\{series\}\}\{\{shape\}\}$

`\version@list` We initialize the version list to be empty.

```
16 \let\version@list=\@empty
17 \onlypreamble\version@list
```

(End definition for `\version@list`.)

`\version@elt`

```
18 \let\version@elt\relax
19 \onlypreamble\version@elt
```

(End definition for `\version@elt`.)

`\new@mathversion` The macro `\new@mathversion` is called with the version control sequence as its argument.

```
20 \%def\new@mathversion#1{%
```

The first thing this macro does is to check if the version identifier is already present in `\version@list`. We enclose `\version@list` in braces since it might be empty (if no *version* is defined yet). But this means that we need a suitable number of `\expandafter` primitives.

```
21 \% \expandafter\in@\expandafter#1\expandafter{\version@list}%
22 \% \ifin@
```

If so it prints an error message. The `\next` macro is used to get rid of the four characters `\mv@` that would otherwise appear at the begin of the version name in the error message.

```
23 \% \@latex@error{Math version
24 \% '\expandafter@gobblefour\string#1'
25 \% already defined}\@eha
```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to `\version@list`. This is very easy: we define `\version@elt` (which is the delimiter in `\version@list`) to protect itself and the following token from being expanded and simply redefine `\version@list`.

```
26 \% \else
27 \% \global\expandafter\newcount\csname c@\expandafter
28 \% \gobble\string#1\endcsname
29 \% \global\csname c@\expandafter
30 \% \gobble\string#1\endcsname\@ne
31 \% \def\version@elt{\noexpand\version@elt\noexpand}%
32 \% \edef\version@list{\version@list\version@elt#1}%
```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use `\reserved@c` as delimiter, and that there appears the control sequence `\reserved@e` that must not be expanded. Therefore we take suitable precautions.

```
33 % \def\reserved@c{\noexpand\reserved@c\noexpand}%
34 % \let\reserved@e\relax
```

We will now go through the `\alpha@list` to process every *(math alphabet identifier)* in turn. Since this list has `\group@elt` as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
35 % \def\group@elt##1##2##3{%
```

The first of these arguments is the *(math alphabet identifier)*. We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for `\reserved@c` and `\reserved@e` made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro `\remove@nil` which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
36 % \edef##1{\expandafter\remove@nil##1%
37 % \reserved@c
38 % #1%
39 % \reserved@e
40 % \noexpand\@nil}}%
```

Finally we call `\alpha@list` which will now execute the macro `\group@elt` once for every defined *(math alphabet identifier)*. And that's all for now.

```
41 % \alpha@list
42 % \fi}
```

*(End definition for \new@mathversion.)*

**\alpha@list** As we explained above every entry in `\alpha@list` has the form

`\alpha@elt  
(alphabet identifier)<internal group number><default font assignments>...`

We initialize it to `\empty`.

```
43 \let\alpha@list\empty
44 \onlypreamble\alpha@list
```

*(End definition for \alpha@list.)*

**\alpha@elt**

```
45 \let\alpha@elt\relax
46 \onlypreamble\alpha@elt
```

*(End definition for \alpha@elt.)*

**\newgroup** Start the group (fam) allocation at 0. (Doesn't belong here.)

```
47 \count18=-1
```

*(End definition for \newgroup.)*

**\stepcounter**

*(End definition for \stepcounter.)*

\select@group We surround \select@group with braces so that functions using it can be used directly after \_ or ^. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if \math@bgroup is not \bgroup) we need to get rid of the extra group.

```

`\c@localalphabets` To avoid hitting the “no more math fams available” limit of 16, we keep a defined number of math alphabets flexible/local. If we have to allocate any of those we roll back the allocation after the formula has ended, so the next formula can use other alphabets in the slot(s). This makes the processing a bit slower if you are working at the limit, but that is better than dying with “out of memory”.

```

137 </2ekernel>
138 <|latexrelease>\IncludeInRelease{2021/11/15}
139 <|latexrelease> {\document@select@group}{\document@select@group}%
140 {*2ekernel | latexrelease}

```

We don’t really undo the declaration on rollback (as that would be hard to maintain), so rolling forward needs to check if the declaration was already made.

```
141 \ifx\c@localmathalphabets\undefined
```

There is no need to have this counter as part of the include checkpoints, given that it makes little sense to alter its settings mid document. All we want is the ability to change it using the `\setcounter` interface.

By default we keep two math fams flexible.

```

142 \newcount\c@localmathalphabets
143 \setcounter{localmathalphabets}{2}
144 \fi

```

(*End definition for \c@localalphabets.*)

`\document@select@group` The `\document@select@group` command is the version of `\select@group` (inside math versions) that is used in the document body to set up math alphabets (if used).

```

145 \def\document@select@group#1#2#3#4{%
146 \ifx\math@bgroup\math@bgroup\else\relax\expandafter\@firstofone\fi
147 {%
148 \ifmmode

```

We first check if there is still room for allocating another mathgroup. If there is, we check if it can be globally allocated or if we have reached the limit which is given by `\e@mathgroup@top` with `\c@localmathalphabets` subtracted.

```

149 \ifnum\csname c@mv@\math@version\endcsname<\e@mathgroup@top
150 \ifnum \numexpr\mathgroup@top-\c@localmathalphabets
151 >\csname c@mv@\math@version\endcsname
152 \else

```

If we are past this point we freeze the current state of the math version so that we can return to it after the formula has ended. Of course, that should be done only once, so we check if `\mv@<version>@frozen` already exists.

```
153 \ifcsname mv@\math@version @frozen\endcsname \else
```

We have to pass the current value of `\math@version` not the macro itself, because some of the processing is delayed to a point where the value may have changed again—not doing this caused a puzzling error in one setup.

```

154 \expandafter\freeze@math@version\expandafter{\math@version}%
155 \fi
156 \fi
157 \begingroup
158 \escapechar\m@ne
159 \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%
160 \globaldefs\one \math@fonts

```

```

161 \endgroup
162 \expandafter\extract@alph@from@version
163 \csname mv@\math@version\expandafter\endcsname
164 \expandafter{\number\csname
165 c@mv@\math@version\endcsname}%
166 #1%
167 \global\advance\csname c@mv@\math@version\endcsname\@ne
168 \else
169 \let#1\relax
170 \@latex@error{Too many math alphabets used in
171 version \math@version}%
172 \@eha
173 \fi

```

Extra `\expandafter` to remove the `\expandafter` added below

```
174 \else \expandafter\expandafter\expandafter\non@alpherr\fi
```

We surround `\select@group` with braces so that functions using it can be used directly after `_` or `^`.

If the legacy interface is used, e.g., `$_\sf -1$` the math alphabet `#1` does not take an argument so we better do not surround `#4` with braces, because then we get `\relax` into the formula and introduce an extra Ord atom. The two different cases can be distinguished by looking at the current value of `\math@bgroup`.

```

175 \expandafter#1\ifx\math@bgroup\bgroup{#4}\else#4\fi
176 }%
177 }

```

`\freeze@math@version` This command stores the current state of the math version and sets things up to return to it after each formula from now on. We use L3 programming layer code to set it up.

```

178 \ExplSyntaxOn
179 \cs_new_protected:Npn\freeze@math@version #1 {

```

Save the current `\mv@<version>` code and the number of allocated mathgroups inside.

```

180 @font@info{Freeze~ math~ alphabet~ allocation~ in~ version-
181 #1.\MessageBreak
182 Allocated-math-groups:~\int_use:c{ c@mv@ #1 }~%
183 (local:~ \int_use:N\c@localmathalphabets)~}
184 \cs_gset_eq:cc { mv@#1@frozen }{ mv@#1 }
185 \tl_gset:cx { g__nfss_frozen_mv_ #1 _tl }{ \int_use:c { c@mv@#1 } }

```

Doing the reset the first time, we wait until we are out of math mode, so we use some recursive `\group_insert_after:N` for this before we execute `\mv@<version>@reset`.

```

186 \group_insert_after:N __nfss_init_mv_freeze:N
187 \exp_after:wN \group_insert_after:N \cs:w mv@#1@reset \cs_end:

```

The `\check@mathfonts` is called at the very beginning of each math formula, so it is a good way to hook in the resetting. Again that has to happen after the formula has ended, but we know because of the place where `\check@mathfonts` is used that a single `\aftergroup` is sufficient.

```

188 \tl_gput_right:No \check@mathfonts
189 {
190 \exp_after:wN \group_insert_after:N \cs:w mv@#1@reset \cs_end:
191 }

```

Here is the definition of `\mv@{version}@reset`. If there has been no new math alphabet allocation, doing a reset would just cause a lot of unnecessary processing, so we do a quick check upfront for this.

```

192 \cs_gset:cpn{\mv@#1@reset}
193 {
194 \int_compare:nNnTF { \int_use:c{c@\mv@#1} } >
195 { \tl_use:c{g__nfss_frozen_mv_ #1 _tl} }
196 {
197 \font@info{Undo~math~alphabet~allocation~in~version~#1}

```

If the undo is necessary, we restore the `\mv@{version}` code.

```

198 \cs_gset_eq:cc { mv@#1 }{ mv@#1@frozen }
199 \int_gset:cn { c@\mv@#1 }{ \tl_use:c {g__nfss_frozen_mv_ #1 _tl} }

```

But we also should undo changes to the math alphabet definitions. We therefore run this code with a modified definition for `\getanddefine@fonts` because there is no need to do anything to the symbol fonts that are permanently allocated.

```

200 \group_begin:
201 \cs_set_eq:NN \getanddefine@fonts \use_none:nn
202 \use:c {mv@#1}
203 \group_end:
204 }
205 {

```

If there was no change, we report that in the log (but this branch could go completely).

```

206 \font@info{No~math~alphabet~change~to~frozen~version~#1}
207 }

```

If this is executed after a math display, we may have to arrange for ignoring spaces, because they are now hidden if the tokens from above intervene. This is signaled by the `2e` switch `@ignore` which is set in `\frozen@everymath` and `\frozen@everydisplay`.

This is all `2e` code so we use that syntax.

```

208 \if@ignore \ignorespaces \fi
209 }
210 }

```

To do the initial freeze in a safe place, we check if we are in math mode and if so try again after the group has ended by pushing the command and its single token argument with two `\group_insert_after:N`s after the current group. If we are no longer in math mode we bypass the conditional and so the next token is our argument which is then finally executed.

```

\@xxDeclareMathDelimiter

This macro checks if the second arg is a “math type” such as \mathopen. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```
 882 \def\@xxDeclareMathDelimiter#1#2#3#4{%
```

7 is the default value returned in the case that \mathchar@type is passed something unexpected, like a math symbol font name. We locally move \mathalpha out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```
 883 \begingroup
 884 \let\mathalpha\mathord
 885 \ifnum7=\mathchar@type{#2}%
 886 \endgroup
```

If this branch is taken we have old syntax (5 arguments).

```
887 \expandafter\@firstofone
888 \else
```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```
889 \endgroup
890 \DeclareMathSymbol#1{#2}{#3}{#4}%

```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

1084 \expandafter\DeclareSymbolFontAlphabet@
1085 \csname \expandafter\gobble\string#1\space\endcsname{#2}#1}
1086 \onlypreamble\DeclareSymbolFontAlphabet

(End definition for \DeclareSymbolFontAlphabet.)
```

```
\DeclareSymbolFontAlphabet@
1087 \def\DeclareSymbolFontAlphabet@#1#2#3{%
We use the switch \if@tempswa to decide if we can declare this symbol font alphabet.
1088 \if@tempswatru
First check if #2 is known to be a symbol font
1089 \expandafter\in@\csname sym#2\expandafter\endcsname
1090 \expandafter{\group@list}%
1091 \ifin@
```

Check if #1 is defined as a math alphabet defined via \DeclareMathAlphabet:

```
1092 \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
1093 \ifin@
```

If so remove it from the `\alpha@list` and from all math version macros.

```

1094 \Qfont@info{Redefining math alphabet \string#3}%
1095 \toks@{}%
1096 \def\alpha@elt##1##2##3{%
1097 \ifx##1#1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
1098 \alpha@list
1099 \xdef\alpha@list{\the\toks@}%

```

Now we loop over all versions and remove the math alphabet:

```

1100 \def\version@elt##1{%
1101 \begingroup
1102 \toks@{}%
1103 \def\getanddefine@fonts####1####2{%
1104 \addto@hook\toks@{\getanddefine@fonts####1####2}}%
1105 \def\install@mathalphabet####1####2{%
1106 \ifx####1#1\else
1107 \addto@hook\toks@{\install@mathalphabet
1108 ####1{####2}}\fi}%
1109 ##1%
1110 \xdef##1{\the\toks@}%
1111 \endgroup
1112 }%
1113 \version@list
1114 \else

```

If #3 is not defined as a math alphabet check if it is defined at all:

```

1115 \expandafter\ifx
1116 \csname\expandafter\gobble\string#1\space\endcsname
1117 \relax

```

If it is undefined, fine otherwise check if it is a math alphabet defined via `\DeclareSymbolFontAlphabet`:

```

1118 \else
1119 \edef\reserved@a{%
1120 \noexpand\in@{\string\use@mathgroup}{\meaning#1}%
1121 \reserved@a
1122 \ifin@
1123 \Qfont@info{Redefining math alphabet \string#3}%
1124 \else

```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```

1125 \tempswafalse
1126 \Qlatex@error{Command '\string#3' already defined}\@eha
1127 \fi
1128 \fi
1129 \fi
1130 \else

```

Since the symbol font is not known we better skip defining this alphabet.

```

1131 \tempswafalse
1132 \Qlatex@error{Unknown symbol font '#2'}\@eha
1133 \fi
1134 \if@tempswa

```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup <math-settings> \sym<name>
```

The *<math-settings>* are the one for the encoding that is used in the font shape where `\sym<name>` is pointing to. This means that we have to get it from the information stored in `\group@list`. Thus we loop through that list after defining `\group@elt` in a suitable way.

```

1135 \def\group@elt##1##2{%
1136 \expandafter\ifx\csname sym#2\endcsname##1%
1137 \expandafter\reserved@a\string##2\@nil
1138 \fi}%
1139 \def\reserved@a##1##2##3\@nil{%
1140 \def\reserved@a{##2}}%
1141 \group@list
1142 \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%
1143 \edef#1{\the\toks@
1144 \noexpand\use@mathgroup
1145 \expandafter\noexpand\csname M@\reserved@a\endcsname
1146 \csname sym#2\endcsname}%
1147 \def#3{\protect#1}%
1148 \fi
1149 }
1150 \onlypreamble\DeclareSymbolFontAlphabet@
1151 </2ekernel>

```

(End definition for `\DeclareSymbolFontAlphabet@`.)

# File A

## ltfssini.dtx

This file contains the top level L<sup>A</sup>T<sub>E</sub>X interface to the font selection scheme commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of these commands.

### 1 NFSS Initialization

Finally, there are six commands that are to be used in L<sup>A</sup>T<sub>E</sub>X and that we will therefore protect against expansion at the wrong point: \fontfamily, \fontseries, \fontshape, \fontsize, \selectfont, and \mathversion.

```
1 <*2ekernel>
```

#### 1.1 Providing math *versions*

L<sup>A</sup>T<sub>E</sub>X provides two *versions*. We call them *normal* and *bold*, respectively.

```
2 \DeclareMathVersion{normal}
3 \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of \rmfamily etc. in math mode.

(Actually most are now defined further down in the file.)

First the changes to another *family*:

```
4 \%{\ DeclareRobustCommand{\rmfamily
5 % {\not@math@alphabet\rmfamily\mathrm
6 % \fontfamily\rmdefault\selectfont}
7 \%{\ DeclareRobustCommand{\sffamily
8 % {\not@math@alphabet\sffamily\mathsf
9 % \fontfamily\sfdefault\selectfont}
10 \%{\ DeclareRobustCommand{\ttfamily
11 % {\not@math@alphabet\ttfamily\mathtt
12 % \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
13 \%{\ DeclareRobustCommand{\bfseries
14 % {\not@math@alphabet\bfseries\mathbf
15 % \fontseries\bfdefault\selectfont}
16 \%{\ DeclareRobustCommand{\mdseries
17 % {\not@math@alphabet\mdseries\relax
18 % \fontseries\mddefault\selectfont}
19 \%{\ DeclareRobustCommand{\upshape
20 % {\not@math@alphabet\upshape\relax
21 % \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
22 \%{\ DeclareRobustCommand{\slshape
23 % {\not@math@alphabet\slshape\relax
24 % \fontshape\sldefault\selectfont}
25 \%{\ DeclareRobustCommand{\scshape
26 % {\not@math@alphabet\scshape\relax
```

```

27 \fontshape\scdefault\selectfont}
28 \DeclareRobustCommand\itshape
29 {\not@math@alphabet\itshape\mathit
30 \fontshape\itdefault\selectfont}

```

## 2 Custom series settings for main document families

This section was introduced 2020/02/02 and for now we support a full rollback (may need splitting later).

```

31 </2ekernel>
32 <*2ekernel | latexrelease>
33 <latexrelease>\IncludeInRelease{2021/11/15}%
34 <latexrelease> {\DeclareFontSeriesDefault}{Custom series}%

```

One problem with the NFSS approach of handling the series axis turned out to be that (especially with respect to “boldness”) different font families implemented different strategies. For example, with Computer Modern fonts you normally only have `bx` whereas most PostScript fonts offered only `b` but not `bx`. As a result L<sup>A</sup>T<sub>E</sub>X’s standard setting for `\bfdefault` didn’t work with such fonts, but if it got changed to produce `b`, then that didn’t work with Computer Modern if the fonts got combined (e.g., using Computer Modern Typewriter with such fonts).

The solution back then was to provide substitution rules in the font .fd such that if a `bx` series got requested the `b` series got used. While this works in that particular case, it isn’t a very general solution. For example, if you happen to have a font family that has several weights you may want to typeset the whole document in a somewhat lighter or darker font but if you then modify `\mddefault` to allow for this, then of course your change only works with that particular family but not with the typewriter or sans serif family you also want to use.

A better solution was provided by the `mweights` package by Bob Tennent that offers defaults on the level of the three main font families in the document: for “rm”, “sf” and “tt” so that font packages could define defaults for the sans serif document font by providing `\bfseries@sf` which then was used when `\bfseries` got executed and the current family was the `\sffamily`.

`\DeclareFontSeriesDefault`

We now support this concept directly from within L<sup>A</sup>T<sub>E</sub>X and for use in font packages (or the document preamble) we offer `\DeclareFontSeriesDefault`. This declaration takes three arguments:

**document family interface:** Can either be `rm`, `sf` or `tt`. This is optional and if not given the overall default.

**document series interface:** Can be `md` or `bf`.

**series value:** This is the value that is going to be used with the combination is requested.

For example, `\DeclareFontSeriesDefault[rm]{bf}{sb}` would use `sb` (semi-bold) when `\rmfamily\bfseries` is asked for.

If used without the optional argument, e.g., `\DeclareFontSeriesDefault{bf}{b}` then this is like redefining `\bfdefault` or `\mddefault`.

If some family specify defaults aren't given, e.g. if there are no declarations for, say, `tt` then the format defaults of `\mddefault` and `\bfdefault` are assumed. If those are later changed this is *not* reflected!<sup>28</sup>

`\DeclareFontSeriesDefault` The command to declare font series defaults for the “rm”, “sf” or “tt” family.

```

35 \let\DeclareFontSeriesDefault\@undefined % for rollback
36 \newcommand\DeclareFontSeriesDefault[3][]{%
37 \expandafter\def\@empty
38 \ifcsname#2series\endcsname % supported are
39 \ifcsname#3series\endcsname
40 \def\reserved@a{\#1}%

```

No optional argument: set up general default.

```

41 \ifx\reserved@a\@empty
42 \ifcsname #2series\endcsname % supported are
43 \ifcsname #3series\endcsname

```

Adding `\@empty` allows us to detect if the default gets redefined with `\renewcommand` or `\def` by the user.

```

44 \expandafter\def
45 \csname #2default\endcsname{\#3\@empty}%
46 \expandafter\def
47 \csname #2default@previous\endcsname{\#3\@empty}%
48 \else
49 \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
50 {Mandatory first argument must be 'md' or 'bf'.}
51 \fi

```

Optional argument given, set up specific default.

```

52 \else
53 \ifcsname #2series@\#1\endcsname % supported are
54 \ifcsname #3series@\#1\endcsname
55 \expandafter\edef
56 \csname #2series@\#1\endcsname{\#3}%

```

If the interface is used we remove the frozen kernel default. This way, we know that something was explicitly set up (even if the setup has the same value as the default).

```

57 \expandafter\let
58 \csname #2series@\#1@kernel\endcsname\@undefined
59 \else
60 \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
61 {Optional argument must be 'rm', 'sf', or 'tt'. \MessageBreak
62 Mandatory first argument must be 'md' or 'bf'.}
63 \fi
64 \fi
65 }

```

---

<sup>28</sup>I see no easy way to achieve this without compromising compatibility with existing packages that currently use `mweights` and directly define (some) of the `\mdseries@..` commands but not others.

```

(End definition for \DeclareFontSeriesDefault.)
```

```

```

`\mdseries@rm` We initialize the family specific default at the end of the format generation. Later on  
`\mdseries@sf` they may get overwritten in the preamble or a package via `\DeclareFontSeriesDefault`  
`\mdseries@tt` (or possibly directly).

`\bfseries@rm` Conceptual change: The `\bfdefault` will be `b` not `bx` because that is what it should  
`\bfseries@sf` be really for nearly every font except Computer/Latin Modern.

`\bfseries@tt` To account for the fact that by default we typeset in CM or LM we set up the  
`\bfseries@..` defaults to use `bx` instead.

This means that it behaves like before because if the default fonts are used then  
`\bfseries@rm` etc kick in and make `\textbf` use `bx`. However, if the font gets changed  
`\bfseries@sf` then `\bfdefault` will get used.

```
128 \def\bfseries@rm{bx}
129 \def\bfseries@sf{bx}
130 \def\bfseries@tt{bx}
```

Frozen version of the kernel defaults so we can see if they have changed.

```
131 \let\bfseries@rm@kernel\bfseries@rm
132 \let\bfseries@sf@kernel\bfseries@sf
133 \let\bfseries@tt@kernel\bfseries@tt
```

The default for the medium series is `m` and this will be interpreted as resetting both  
weight and width. To reset only one of them the virtual value `?m` and `m?` are available.

```
134 \def\mdseries@rm{m}
135 \def\mdseries@sf{m}
136 \def\mdseries@tt{m}
```

(*End definition for `\mdseries@rm` and others.*)

`\series@change@debug` For debugging, but right now none of this code is extracted. The idea is to have a separate  
package with debugging code one day.

```
137 ⟨*debug⟩
138 \let\series@change@debug\typeout
139 \let\series@change@debug\@gobble
140 ⟨/debug⟩
```

(*End definition for `\series@change@debug`.*)

`\prepare@family@series@update` This is core command that prepares for the family update. The big difference to the  
documented code above is that the nested `\ifx` statements seem to be missing. Instead  
we loop through an internal list that holds the names of the three meta families. This  
approach allows us to extend the mechanism at a later stage to allow for additional named  
meta families.

Here is the current definition of that list:

```
141 \def\@meta@family@list{\@elt{rm}\@elt{sf}\@elt{tt}}
```

```
142 \def\prepare@family@series@update#1#2{%
```

```
143 \if@forced@series
```

```
144 <+debug> \series@change@debug{No series preparation (forced \f@series)\on@line}%
145 \fontfamily#2%
```

```
146 \else
```

```
147 <+debug> \series@change@debug{Preparing for switching to #1 (#2)\on@line}%
148 \expand@font@defaults
```

We prepare for changing the current series. We have to find it before changing the family as discussed above.

```
149 \let\target@series@value\empty
150 \def\target@meta@family@value{#1}%
```

As the very last item in the meta family list we add `\@elt{??}` and define this pseudo meta family to be the current font family. So if none of the real meta families matched then this will match. This will cover the following case:

- `\bfseries` is called for a family using `bx` (e.g., CMR)
- Switch to a font family that is none of the meta families, e.g., via `\fontfamily{ptm}\allowbreak\verb+\bfseries+`
- Then none of the real meta families, match but the final `\@elt{??}` will.
- Therefore if the current series is `\mddefault` or `\bfdefault` it will be detected and the corresponding target series selected.

```
151 \expandafter\edef\csname ??def@ult\endcsname{\f@family}%
```

To find it we loop over the meta family list with a suitable definition of `\@elt`.

```
152 \let\@elt\update@series@target@value
153 \@meta@family@list
```

Last resort pseudo meta family. Will only be looked at if none of the real ones have matched.

```
154 \@elt{??}%
155 \let\@elt\relax
```

That will figure out the correct series value to use without updating it. Now we can change the family.

```
156 \fontfamily#2%
```

After that we update the series. That code is again like the one above.

```
157 \ifx\target@series@value\empty
158 <+debug> \series@change@debug{Target series still empty ...}%
159 \else
160 \ifx\f@series\target@series@value
161 <+debug> \series@change@debug{Target series unchanged:
162 <+debug> \f@series \space = \target@series@value}%
163 \else
164 \maybe@load@fontshape
165 <+debug> \series@change@debug{Target series:
166 <+debug> \f@series \space -> \target@series@value}%
```

The `\target@series@value` may contain something like `cm` (coming from a default) and so we can't directly assign it to `\f@series` because we have to drop any surplus `m` first.

```

167 % \let\f@series\target@series@value
168 \series@maybe@drop@one@m\target@series@value\f@series
169 \fi
170 \fi
171 \fi
172 }
```

(End definition for `\prepare@family@series@update` and `\@meta@family@list`.)

#### `\update@series@target@value`

In this macro used in the loop you basically find the nested `\ifxs` from the outline above. The only difference is that it is parameterized instead of being written out and only for one block of tests because the code is called repeatedly when looping over the meta family list. From the list we get each meta family name in turn.

```
173 \def\update@series@target@value#1{%
```

There is one additional test at the beginning, because the list contains all meta families and we need to ignore the case where current one from the list and target one are identical.

```

174 \def\reserved@a{\#1}%
175 \ifx\target@meta@family@value\reserved@a % rm -> rm do nothing
176 \else
177 {+debug} \series@change@debug{Trying to match #1: \csname#1\def@ult\endcsname
178 {+debug} \space = \f@family\space ?}%

```

We only "do" something if the current font family matches the current meta family.

```
179 \expandafter\ifx\csname#1\def@ult\endcsname\f@family
```

If that's the case we know that this is the block that applies (only one meta family can match). So to speed things up we change `\@elt` so that the rest of the loop gets gobbled.

```
180 \let\@elt\@gobble
```

Then we try to find the right new value for the series (as explained above). The two macros defined first are only there because we now need to use `\csname` and this way the code will be a little faster.

```

181 \expandafter\let\expandafter\reserved@b
182 \csname mdseries@\target@meta@family@value\endcsname
183 \expandafter\let\expandafter\reserved@c
184 \csname bfseries@\target@meta@family@value\endcsname
185 {+debug} \series@change@debug{Targets for mdseries and bfseries:
186 {+debug} \reserved@b\space and \reserved@c}%

```

This here is now identical to the nested `\ifx` block from the outline, except that it there appeared twice in `\rmfamily`. This is now covered by looping and stopping the loop when a match was found.

We have to sanitize the default value first because it may contain something like `mc` and that would never match `\f@series` because there it would be called `c` with the `m` dropped. It would be probably better to do that differently these days, but it is hard to adjust without causing a lot of issues, so we do the dropping in various places instead.

```

187 \expandafter\series@maybe@drop@one@m
188 \csname mdseries@#1\endcsname\reserved@d
189 \ifx\reserved@d\f@series
190 {+debug} \series@change@debug{mdseries@#1 matched -> \reserved@b}%
191 \let\target@series@value\reserved@b
192 \else

```

Again do some sanitizing.

```
193 \expandafter\series@maybe@drop@one@m
194 \csname bfseries@#1\endcsname\reserved@d
195 \ifx\reserved@d\f@series
196 {+debug} \series@change@debug{bfseries@#1 matched -> \reserved@c}%
197 \let\target@series@value\reserved@c
198 \else\ifx\f@series\mddef@ult \let\target@series@value\reserved@b
199 {+debug} \series@change@debug{mddef@ult matched -> \reserved@b}%
200 \else\ifx\f@series\bfdef@ult \let\target@series@value\reserved@c
201 {+debug} \series@change@debug{bfdef@ult matched -> \reserved@c}%
202 \fi\fi\fi\fi
203 \fi
204 \fi
205 }
```

(End definition for \update@series@target@value.)

\init@series@setup This is code to be run at begin document ...

```
206 \def\init@series@setup{%
```

We only want **b** in \bfseries@rm if the roman font is Computer Modern or Latin Modern, otherwise it should be **b**. It was set to **b** in the kernel so that any font use with the default families in the preamble get this value. Now at the real document start we check if the fonts have been changed. If there was a \DeclareFontSeriesDefault declaration or \bfseries@rm was directly altered then it differs from \bfseries@rm@kernel and we do nothing. Otherwise we check if \rmdefault is one of the CM/LM font families and if so we keep **b** otherwise we change it to **b**.

This approach doesn't cover one case: CM/LM got changed to a different family that supports **b**, but the support package for that family used \def\bfseries@rm{bx} instead of using \DeclareFontSeriesDefault. In that case the code here changes it to **b**. Solution: use the \DeclareFontSeriesDefault interface.

```
207 \ifx\bfseries@rm@kernel\bfseries@rm
208 \expandafter\in@\expandafter{\rmdefault}%
209 {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmmt}%
210 \ifin@ \else \def\bfseries@rm{b}\fi\fi
```

Same approach for \bfseries@sf and \bfseries@tt:

```
211 \ifx\bfseries@sf@kernel\bfseries@sf
212 \expandafter\in@\expandafter{\sfdefault}%
213 {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmmt}%
214 \ifin@ \else \def\bfseries@sf{b}\fi\fi
215 \ifx\bfseries@tt@kernel\bfseries@tt
216 \expandafter\in@\expandafter{\ttdefault}%
217 {cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmmt}%
218 \ifin@ \else \def\bfseries@tt{b}\fi\fi
```

If the document preamble has changed the \familydefault or if the if the \rmdefault contains a new font family, we may have to adjust the series defaults accordingly, before starting typesetting.

Similarly, if the user has changed the \mddefault or the medium series for the family selected as document font we may also have to adjust the \seriesdefault.

On the other hand if the document font is still CM or LM then \bfdefault is wrong, because it is now saying **b** and not **B** as it should for such fonts.

To fix all this we first run `\reset@font` (the internal kernel name for `\normalfont`). This will set up the document encoding, family, series and shape based on the current values of `\encodingdefault`, `\familydefault`, `\seriesdefault` and `\shapedefault`. However, if the family (from `\familydefault`) has special medium default we should switch to that (and not use what is current value from `\seriesdefault`). This can be achieved by afterwards calling `\mediumseries` and then changing `\seriesdefault` to the now current series value (in `\f@series`).

But what should happen if `\seriesdefault` got explicitly changed? In that case the explicit change should survive and we should not alter `\seriesdefault`. This is solved by comparing the current value of `\seriesdefault` with a kernel version saved in the format and if they differ we do not call `\mdseries` or change `\seriesdefault`.

```

219 \reset@font
220 \ifx\seriesdefault\seriesdefault@kernel
221 \mdseries
222 \let\seriesdefault\f@series
223 \fi
224 }%

```

(End definition for `\init@series@setup`.)

As the kernel code now implements the same functionality as `mweights`, albeit internally coded slightly differently, that package shouldn't be loaded any more. We therefore pretend that it already got loaded. Thus, a font package that tries to load it and then sets `\mdseries@...`, etc. will continue to work but will now use the kernel code.

Of course, mid-term such package should probably use `\DeclareFontSeriesDefault` instead of making using low-level definitions.

```

`\expand@font@defaults` The family specific defaults are fully expanded, i.e., they are defined via `\edef` inside `\DeclareFontSeriesDefault`. However, the overall defaults, e.g., `\bfdefault` may have been redefined by the user and thus may not be fully expanded. So to enable reliable comparison we make expanded versions of them. That we rerun each time. The alternative would be to only allow for changes before begin document.

`\rm@def@ult` 397 `\def\expand@font@defaults{%`

`\sf@def@ult` 398 `\edef\rmdef@ult{\rmdefault}%`

`\tt@def@ult` 399 `\edef\sfdef@ult{\sfdefault}%`

`\md@def@ult` 400 `\edef\ttdef@ult{\ttdefault}%`

The series defaults may contain some surplus `m` that we need to drop here.

```

401 \series@maybe@drop@one@m\bfdefault\bfdef@ult
402 \series@maybe@drop@one@m\mddefault\mddef@ult

```

Formats that set up parallel fonts, e.g., for Japanese, can use this hook to add additional code here.

```

403 \UseHook{\expand@font@defaults}%
404 }

```

(End definition for `\expand@font@defaults` and others.)

`\rmfamily` Here are the document level commands for changing the main font families, or rather, here is a documented outline of the code, the actual code is then streamlined and somewhat generalized.

```

\rmfamily\rmfamily{%
\not@math@alphabet\rmfamily\mathrm

```

If families are changed then we have to do a bit more work. In the original NFSS implementation a family change kept encoding, series shape and size unchanged but now we can't any longer simply reuse the current series value. Instead we may have to change it from one family default to the next.

```
\expand@font@defaults
```

We have to do the testing while the current family is still unchanged but we have to do the adjustment of the series after it got changed (because the new family might have different sets of shapes available and we certainly don't want to see substitution going on. So we use `\target@series@value` to hold the target series (if any).

```
\let\target@series@value\empty
```

Thus, if the current family is the sans family

```
\ifx\f@family\sfdef@ult
```

and if we using the medium series of the sans family

```
\ifx\f@series\mdseries@sf
```

then lets switch to the medium series for the serif family

```
\let\target@series@value\mdseries@rm
```

and if we use the bold series of the sans family switch to the bold default of the serif family:

```
\else\ifx\f@series\bfseries@sf \let\target@series@value\bfseries@rm
```

However, the sans family may not have any specific defaults set, so we also compare with the overall defaults.

```
\else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm
\else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm
```

If neither test was true we leave the series alone. This way a special manual setting such as `\fontseries{lc}` is not undone if the family changes (of course there may not be any support for it in the new family but then the NFSS substitution kicks in and sorts it out).

```
\fi\fi\fi\fi
```

We need to do the same if the current family is the typewriter family:

```
\else\ifx\f@family\ttdef@ult
 \ifx\f@series\mdseries@tt \let\target@series@value\mdseries@rm
 \else\ifx\f@series\bfseries@tt \let\target@series@value\bfseries@rm
 \else\ifx\f@series\mddef@ult \let\target@series@value\mdseries@rm
 \else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm
 \fi\fi\fi\fi
\fi\fi
```

With these preparations for series out of the way we can now change the font family to `\rmdefault`.

```
\fontfamily\rmdefault
```

If `\target@series@value` is still empty there is nothing more to do other than selecting the new family. However, if not then we should update the font series now as well. But there is one further subtle issue. We may not have loaded an `.fd` file for our target font family yet. In the past that was done in `\selectfont` if necessary but since we are now doing all the comparisons in `\fontseries` we need to make sure that the font family specifications are already loaded prior to calling `\fontseries`.

```
\ifx\target@series@value\empty \else
 \maybe@load@fontshape
```

Updating the series in this case means directly changing `\f@series` to the target value. We don't want to go through `\fontseries` because that would apply the mappings and then `bx + b` would keep `bx` instead of changing to `b` as desired. as

```
\let\f@series\target@series@value
\fi
\selectfont}
```

So now for the real definition: most of the code above gets delegated to a helper command `\prepare@family@series@update` so that the definition becomes again fairly short. In addition we add a hook, mainly for our Japanese friends so that the code can be extended prior to the call to `\selectfont`.

```
405 \DeclareRobustCommand\rmfamily{%
 406 \not@math@alphabet\rmfamily\mathrm}
```

This holds all the code discussed above, first argument is the meta family, i.e., `rm` in this case, and second argument is the default family name, e.g., `cmr` indirectly accessed via `\rmdefault`. This is calling `\fontfamily` and if necessary `\fontseries` as outline above.

```
407 \prepare@family@series@update{rm}\rmdefault
```

Then comes the hook code (by default a no-op) and finally the call to `\selectfont`.

```
408 \UseHook{rmfamily}%
 409 \selectfont
```

The definitions for `\sffamily` and `\ttfamily` are similar, the differences are only in what font families get checked.

```
\ttfamily 410 \DeclareRobustCommand\sffamily{%
 411 \not@math@alphabet\sffamily\mathsf
 412 \prepare@family@series@update{sf}\sfdefault
 413 \UseHook{sffamily}%
 414 \selectfont

 415 \DeclareRobustCommand\ttfamily{%
 416 \not@math@alphabet\ttfamily\mathtt
 417 \prepare@family@series@update{tt}\ttdefault
 418 \UseHook{ttfamily}%
 419 \selectfont}
```

*(End definition for `\rmfamily`, `\sffamily`, and `\ttfamily`.)*

```
rmfamily Declare the hooks used above.
sffamily 420 \NewHook{rmfamily}
ttfamily 421 \NewHook{sffamily}
normalfont 422 \NewHook{ttfamily}
expand@font@defaults 423 \NewHook{normalfont}
bfseries 424 \NewHook{expand@font@defaults}

mdseries 426 \NewHook{bfseries/defaults}
mdseries/defaults 427 \NewHook{mdseries}
428 \NewHook{mdseries/defaults}
```

(End definition for `rmfamily` and others.)

`\@rmfamilyhook` These four hooks have legacy versions used in 2020/02/02 so we should support them  
`\@sffamilyhook` until they aren't any longer used.

By default the hooks do nothing

```
\@defaultfamilyhook 429 \let\@rmfamilyhook\@empty
 430 \let\@sffamilyhook\@empty
 431 \let\@ttfamilyhook\@empty
 432 \let\@defaultfamilyhook\@empty %FMi sort out
```

(End definition for \@rmfamilyhook and others.)

\IfFontSeriesContextTF With the ability for `\bfs` or `\mds` to be mapped to different NFSS axis values it becomes important to have the ability to determine the current context as we can no longer look at `\f@series` to answer a question such as “am I currently typesetting in a bold typeface?”

This is provided by the test `\IfFontSeriesContextTF`. It takes three arguments:

- The context we try to check (either `bf` for bold or `md` for medium, i.e., the same that can go into the first mandatory argument of `\DeclareFontSeriesDefault`),
- what to do if we are in this context (true case) and
- what to do if we are not (false case).

This allows you to define commands like `\IfBold`, e.g.,

```
\newcommand\IfBold[2]{\IfSeriesContextTF{bf}{#1}{#2}}
```

and then do

```
This is \IfBold{bold}{non-bold} text.
```

and get the appropriate result.

```
496 </2ekernel>
497 <*2ekernel | latexrelease>
498 <latexrelease>\IncludeInRelease{2020/10/01}%
499 <latexrelease> {\IfFontSeriesContextTF}{Font series context}%
500 \DeclareRobustCommand\IfFontSeriesContextTF[1]{%
501 \expand@font@defaults
```

In the beginning we haven't found the context we are looking for.

```
502 \@font@series@contextfalse
```

We store the requested context away for use in the tests.

```
503 \def\requested@test@context{\#1}%
```

The next definition is there to ensure that get a final match during testing even if the current family is non of the meta families (`rm`, `sf` or `tt`). This will then basically tests if the current font family matches the overall default.

```
504 \expandafter\edef\csname ??def@ult\endcsname{\f@family}%
```

Then we run through the meta family list (currently containing just the three values) followed by the artificial meta family `??` and test each of them in turn using `\test@font@series@context` as the testing command.

```
505 \let\@elt\test@font@series@context
506 \@meta@family@list
507 \@elt{??}%
508 \let\@elt\relax
```

Following that we evaluate the status of `\if@font@series@context` to determine which of the remaining arguments (true/false case) we have to execute.

```
509 \if@font@series@context
510 \expandafter\@firstoftwo
511 \else
512 \expandafter\@secondoftwo
513 \fi
514 }
```

(End definition for `\IfFontSeriesContextTF`.)

`\test@font@series@context` This tests the context (stored in `\requested@test@context`) and updates the boolean if the right context is found.

```
515 \def\test@font@series@context#1{%
```

First task is to figure out whether the current family matches `\rmfamily`, `\sffamily`, etc. so in `\reserved@a` we store the value of `\rmdef@ult` (or whatever the given meta family is) and compare that to `\f@family`.

```
516 \edef\reserved@a{\csname #1def@ult\endcsname}%
517 \ifx\f@family\reserved@a
```

If they match we have found the right meta family so we don't need to test any of the remaining meta family and therefore change `\@elt` to `\@gobble`.

```
518 \let\@elt\@gobble
```

Now we have to test if `\f@series` matches the requested context (e.g., whether `\bfseries@rm` has that value if the current meta family is `rm` and we are looking for the `bf` context).

```
519 \expandafter\ifx
520 \csname\requested@test@context series@\#1\endcsname\f@series
```

If yes we change the boolean and are done.

```
521 \font@series@contexttrue
```

If not then maybe the reason is that nothing special was set up for that meta family so we also check now if `\f@series` matches the overall default (e.g., `\bfdef@ult` if we are looking for the bold context). If that matches we change the boolean.

```
522 \else
523 \expandafter\ifx
524 \csname\requested@test@context def@ult\endcsname\f@series
525 \font@series@contexttrue
526 \fi\fi\fi
527 }
```

*(End definition for `\test@font@series@context`.)*

`\if@font@series@context` The boolean to signal if we found the requested font series context.

```
528 \newif\if@font@series@context
```

*(End definition for `\if@font@series@context`.)*

```
529 </2ekernel | latexrelease>
530 <latexrelease>\EndIncludeInRelease
531 <latexrelease>\IncludeInRelease{0000/00/00}%

540 <*2ekernel>
```

### 3 Supporting nested emphasis

By default L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  supports two levels of nested emphasis: if the current font has an upright shape then it switches to `\itshape` otherwise to `\emnnershape` (which defaults to `\upshape`). This means nested emphasis will oscillate between italic and upright shapes.

Sometimes it would be nice to allow for a more lengthy sequence, but instead of providing a fixed one L<sup>A</sup>T<sub>E</sub>X now offers a general mechanism that allows to define arbitrary sequences.

```
\DeclareEmphSequence
 \emforce
```

This declaration expects a comma separated list of (font) change declarations corresponding to increasing levels of emphasis. The mechanism tries to be “smart” and verifies that the declarations actually alter the font. If not it will ignore this level and tries the next one—the assumption being that there was a manual font change in the document

to the font that is now supposed to be used for emphasis. Of course, this only works if the declarations in the list actually change the font and not, say, just the color. In such a case one has to use `\emforce` to which directs the mechanism to use the level even if the font attributes haven't changed.

`\emreset` If the nesting is so deep, that the specified levels are exhausted then `\emreset` is used as a final set of declarations (which by default returns back to the upright shape). Any additional nesting levels will then reuse the list from its beginning.

`\DeclareEmphSequence` `\DeclareEmphSequence` expects aclist of declaration. Spaces in the argument are dropped to avoid spurious spaces in the output. The declarations are additive. At the very end the shape is reset using `\emreset` and `\emforce` so that this case is never skipped.<sup>29</sup> Further nested calls restart at the beginning.

```

541 </2ekernel>
542 <*2ekernel | latexrelease>
543 <latexrelease> \IncludeInRelease{2020/02/02}%
544 <latexrelease> {\DeclareEmphSequence}{Nested emph}%
545 \def\DeclareEmphSequence#1{%
546 \protected@edef\emfontdeclare@clist{\zap@space#1, \empty\emforce\emreset}%
547 }

```

By default the it is empty, in which case `\eminnershape` is used by L<sup>A</sup>T<sub>E</sub>X.

```
548 \let\emfontdeclare@clist\empty
```

(End definition for `\DeclareEmphSequence`.)

`\emrest` Reset the font to upright and upper/lower case. With the default rules using `\shapedefault` does that for us but to be on the safe side we do it like this:

```
549 \DeclareRobustCommand\emrest{\upshape\ulcshape}
```

(End definition for `\emrest`.)

`\em` The new definition for `\em` (and implicitly `\emph`) is the same as before as long as `\emfontdeclare@clist` is empty.

```

550 \DeclareRobustCommand\em{%
551 \nomath\em
552 \ifx\emfontdeclare@clist\empty
553 \ifdim \fontdimen1ne\font >\z@
554 \eminnershape \else \itshape \fi
555 \else

```

But if not we use the list to decide how to do emphasis.

We use the current font to check if the declarations have any effect, so even a size change is allowed and identified as a modification (but a color change, for example, isn't). So first we save the current status.

```
556 \edef\em@currfont{\csname curr@fontshape/\f@size\endcsname}%
```

Then we grab the next element from the list and check if it can be used.

```

557 \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
558 \fi
559 }
```

---

<sup>29</sup> Maybe we should not add `\emforce` but allow that case to be skipped as well. Of course, that might result in an endless loop if somebody defines a sequence without any font change and without `\emforce` but ...

```
560 \def\eminnershape{\upshape}
```

(End definition for \em.)

- \do@emfont@update We know that the list (if not empty) has at least 2 elements separated by a comma, so we pick up the first in #1 and the rest in #2.

```
561 \def\do@emfont@update#1,#2\do@emfont@update{%
```

First action is to alter the list and move the first entry to the end

```
562 \def\emfontdeclare@clist{-#2,#1}%
```

Then we execute current declaration. Appending \selectfont means one can write just \fontshape{it}{} and that works then too.

```
563 % \typeout{Use: \detokenize{#1}}%
```

```
564 #1\selectfont
```

We then compare the current font with our saved version, but with a slight twist: we add \em@force at the end of the name. Normally this is empty so has no effect but if there was an \emforce as part of #1 it will append a / to the font name (making it invalid) thus this will then always fail the test.

If the test fails we are done and the declarations will be used. Otherwise we will try the next declaration in the sequence.

```
565 \expandafter\ifx\csname \curr@fontshape/\f@size\em@force
```

For the comparison with \ifx we have to expand \em@currfont once as the relevant info is inside.

```
566 \expandafter\endcsname
```

```
567 \em@currfont
```

```
568 \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
```

If \emforce was used, we have to undo its effect:

```
569 \else
570 \let\em@force\@empty
571 \fi
572 }
```

(End definition for \do@emfont@update.)

- \emforce \em@force The definition of \emforce is simple: change \em@force to make the above test always invalid.

```
573 \protected\def\emforce{\def\em@force{/}}
```

```
574 \let\em@force\@empty
```

```
575 </2ekernel | latexrelease>
```

```
576 <latexrelease>\EndIncludeInRelease
```

(End definition for \emforce and \em@force.)

- \em \eminnershape These are the older definitions for \em, prior to 2020.

We also have to define the *emphasize* font change command (i.e. \em). This command will look is the current font is sloped (i.e. has a positive \fontdimen1) and will then select either \upshape or \itshape.

586 <\latextoken> { \c@nomath\em \ifdim \fontdimen\cne\font > \z@
587 <\latextoken> \eminnershape \else \itshape \fi } %
588 <\latextoken> \EndIncludeInRelease
589 <\latextoken>
590 <\latextoken> \IncludeInRelease{0000/00/00}{\DeclareEmphSequence}{Nested emph} %
591 <\latextoken> \DeclareRobustCommand\em
592 <\latextoken> { \c@nomath\em \ifdim \fontdimen\cne\font > \z@
593 <\latextoken> \upshape \else \itshape \fi } %
594 <\latextoken> \let\eminnershape\@undefined
595 <\latextoken> \EndIncludeInRelease
596 <*2ekernel>
```

(End definition for \em and \eminnershape.)

`\not@math@alphabet` This function generates an error message when it is called in math mode. The same function should be defined in `newlfont.sty`.

```
597 \def\not@math@alphabet#1#2{%
598 \relax
599 \ifmmode
600 \@latex@error{Command \noexpand#1 invalid in math mode}{%
601 {%
602 Please
603 \ifx#2\relax
604 define a new math alphabet^{^J}%
605 if you want to use a special font in math mode%
606 \else
```

We have to a \noexpand below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there :-).

```
607 use the math alphabet \noexpand#2 instead of
608 the #1 command%
609 \fi
610 .
611 }%
612 \fi}
```

(End definition for \not@math@alphabet.)

Finally we provide two abbreviations to switch to the *L<sup>A</sup>T<sub>E</sub>X versions*.

```
613 \DeclareRobustCommand{\boldmath}{\@nomath\boldmath
614 \mathversion{bold}}
615 \DeclareRobustCommand{\unboldmath}{\@nomath\unboldmath
616 \mathversion{normal}}
```

Here we switch to the default math version by defining the internal macro `\math@version`. We dare not to call `\mathversion` at this place because this would call `\gls@settings`.

```
617 \def\math@version{normal}
```

### 3.1 Legacy

We start by defining a few macros that are part of standard L<sup>A</sup>T<sub>E</sub>X's user interface. The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

```
\newfont
618 \def\newfont#1#2{\@ifdefinable#1{\font#1=#2\relax}}
(End definition for \newfont.)

\symbol
619 </2ekernel>
620 <*2ekernel | latexrelease>
621 <latexrelease>\IncludeInRelease{2020/10/01}%
622 <latexrelease> {\symbol}{XeTeX change for math}%
623 \ifdefined\XeTeXversion
624 \DeclareRobustCommand\symbol[1]{\Ucharcat#1 12\relax}
625 \else
626 \DeclareRobustCommand\symbol[1]{\char#1\relax}
627 \fi
628 </2ekernel | latexrelease>
629 <!latexrelease>\EndIncludeInRelease
630 <!latexrelease>\IncludeInRelease{0000/00/00}%
631 <!latexrelease> {\symbol}{XeTeX change for math}%
632 <!latexrelease>
633 <!latexrelease>\DeclareRobustCommand\symbol[1]{\char#1\relax}
634 <!latexrelease>
635 <!latexrelease>\EndIncludeInRelease
636 <*2ekernel>

(End definition for \symbol.)
```

### 3.2 Miscellaneous

\@setfontsize This abbreviation is used by L<sup>A</sup>T<sub>E</sub>X's user level size changing commands, such as \large.  
\@setsizesize 637 \def\@setfontsize#1#2#3{\@nomath#1%  
For the benefit of people relying on keeping the name of the current font command saved in \@currsize we define it. To ensure that \@setfontsize keeps being robust we omit this assignment during times where \protect differs from \typeset@protect.

```
638 \ifx\protect\@typeset@protect
639 \let\@currsize#1%
640 \fi
641 \fontsize{#2}{#3}\selectfont
```

For compatibility we also define \@setsizesize the 209 command

```
642 <*compat>
643 \def\@setsizesize#1#2#3#4{\@setfontsize#1{#4}{#2}}
644 </compat>
```

(End definition for \@setfontsize and \@setsizesize.)

\hexnumber@ To set up L<sup>A</sup>T<sub>E</sub>X's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple \ifcase.

```
645 \def\hexnumber@#1{\ifcase\number#1
646 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
647 9\or A\or B\or C\or D\or E\or F\fi}
```

(End definition for \hexnumber@.)

\nfss@text In its simplest form \nfss@text is an \mbox. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the **amstex** style option one will get a sub style called **amstext** which will redefine the \nfss@text macro to produce correct text in all sizes.

We have to use \def instead of the shorter \let since \mbox is undefined when we reach this point.

```
648 \def\nfss@text#1{{\mbox{#1}}}
```

(End definition for \nfss@text.)

\copyright The definition of \copyright was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in ltoutenc.dtx.

```
649 %\DeclareRobustCommand\copyright
650 % {{\ooalign{\hfil
651 % \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
652 % \mathhexbox20D}}}
```

(End definition for \copyright.)

\normalfont \reset@font The macro \reset@font is used in L<sup>A</sup>T<sub>E</sub>X to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L<sup>A</sup>T<sub>E</sub>X version above but nevertheless are able to run all kind of mixtures.

The user interface name for \reset@font is \normalfont:

```
653 /2ekernel|
654 (*2ekernel | latexrelease)
655 <latexrelease>\IncludeInRelease{2021/06/01}%
656 <latexrelease> {\normalfont}{Add hook to \normalfont}%
657 \DeclareRobustCommand\normalfont{%
```

Instead of calling \usefont, as it was done in the past, we inline the code from \usefont as we want to add the hook before \selectfont, but after all the font attributes are set.

```
658 \fontencoding\encodingdefault
659 \edef\f@family{\familydefault}%
660 \edef\f@series{\seriesdefault}%
661 \edef\f@shape{\shapedefault}%
```

Any earlier \fontseries, etc. should be canceled and we should switch unconditionally to the requested font face so we drop any code that may have been stored in \delayed@f@adjustment.

```
662 \let\delayed@f@adjustment\empty
663 \UseHook{normalfont}%
```

This is the old name for the hook introduced in 2020/02/02. It will be removed in one of the future releases!

```
664 \@defaultfamilyhook % hookname from 2020/02 will vanish
665 \selectfont}
666 \let\reset@font\normalfont
(End definition for \normalfont and \reset@font.)

667 % \changes{v3.2g}{2021/03/18}

706 <latexrelease> {\normalfont}{Add hook to \normalfont}%
707 <latexrelease>
708 <latexrelease>\DeclareRobustCommand\normalfont
709 <latexrelease> {\usefont\encodingdefault
710 <latexrelease> \familydefault
711 <latexrelease> \seriesdefault
712 <latexrelease> \shapedefault
```

```

713 \relax}
714 \let\reset@font\normalfont
715 \let\@defaultfamilyhook\undefined
716 \let\EndIncludeInRelease
717 \EndIncludeInRelease
718 \EndIncludeInRelease
719 {*2ekernel}

```

We left out the special L<sup>A</sup>T<sub>E</sub>X fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```

720 \def\not@base#1{\@latex@error
721 {Command \noexpand#1 not provided in base LATEX2e}%
722 {Load the latexsym or the amsfonts package to
723 define this symbol}}
724 \def\mho{\not@base\mho}
725 \def\Join{\not@base\Join}
726 \def\Box{\not@base\Box}
727 \def\Diamond{\not@base\Diamond}
728 \def\leadsto{\not@base\leadsto}
729 \def\sqsubset{\not@base\sqsubset}
730 \def\sqsupset{\not@base\sqsupset}
731 \def\lhd{\not@base\lhd}
732 \def\unlhd{\not@base\unlhd}
733 \def\rhd{\not@base\rhd}
734 \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```

735 \DeclareErrorFont{OT1}{cmr}{m}{n}{10} %% don't modify this setting
736 %% overwrite it in fontdef.cfg
737 %% if necessary

```

We also set some default values for `\f@family` etc. Note that we don't yet have any encodings that comes later. In the past this was implicitly done by `\DeclareErrorFont`.

```

738 \fontfamily{cmr}

```

Previously the default values for series and shape were set by calling `\fontseries` and `\fontshape`, but their action is now delayed until `\selectfont` which isn't called inside the format (to avoid unnecessarily loading a font that may never get used). We therefore have to set `\f@series` and `\f@shape` directly instead.

```

739 \def\f@series{m} % \fontseries{m}
740 \def\f@shape{n} % \fontshape{n}
741 \fontsize{10}{10}

```

The initial `fontenc` package load list. This will get overwritten in `fonttext` and is only provided in case an old `fonttext.cfg` does not define the command:

```

742 \def@\fontenc@load@list{\@elt{T1,OT1}}

```

We now load the customizable parts of NFSS.

```
743 \InputIfFileExists{fonttext.cfg}
744 {\typeout{=====
745 ^^^J%
746 Local config file fonttext.cfg used^ ^^J%
747 ^^^J%
748 =====}%
749 \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\# ##1}}%
750 }
751 {\input{fonttext.ltx}}
752 \let\@addtofilelist\@gobble
Ditto for math although I don't think that we will get a lot of customisation :-)
753 \InputIfFileExists{fontmath.cfg}
754 {\typeout{=====
755 ^^^J%
756 Local config file fontmath.cfg used^ ^^J%
757 ^^^J%
758 =====}%
759 \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\# ##1}}%
760 }
761 {\input{fontmath.ltx}}
762 \let\@addtofilelist\@gobble
```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file `preload.ltx`.

```
763 \InputIfFileExists{preload.cfg}
764 {\typeout{=====
765 ^^^J%
766 Local config file preload.cfg used^ ^^J%
767 ^^^J%
768 =====}%
769 \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\# ##1}}%
770 }
771 {\input{preload.ltx}}
772 \let\@addtofilelist\@gobble
```

`\seriesdefault` After `\seriesdefault` got defined inside `fonttext.ltx` or a `.cfg` file overwriting it, we alter its value by appending `\empty` to it. This will vanish if expanded but allows us to check if the default gets altered (even to the same value) in the document preamble. All we have to do is to save the current value somewhere and later compare the two. For this we use `\seriesdefault@kernel`.

```
773 \expandafter\def\expandafter\seriesdefault\expandafter{\seriesdefault\empty}
774 \let\seriesdefault@kernel\seriesdefault
```

(End definition for `\seriesdefault` and `\seriesdefault@kernel`.)

`\@acci` We also save the values of some accents in `\@acci`, `\@accii` and `\@acciii` so they can be restored by a `minipage` inside a `tabbing` environment.

```
775 \let\@acci\` \let\@accii\` \let\@acciii\=
```

(End definition for `\@acci`, `\@accii`, and `\@acciii`.)

`\cal` Here were the two old *<alphabet identifiers>*.

`\mit`

(End definition for `\cal` and `\mit`.)

776 `\langle /2ekernel \rangle`

# File B

## fontdef.dtx

<-latexrelease> [2021/01/15 v3.0i LaTeX Kernel (<-latexrelease> font setup)]

### 1 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

### 2 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If  $\text{\LaTeX} 2\epsilon$  finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

**Warning:** please note that we don't support customised  $\text{\LaTeX}$  versions. Thus, before sending in a bug report please try your test file with a  $\text{\LaTeX}$  format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all  $\text{\LaTeX}$  installations behave in the same way.

|     |                                                      |
|-----|------------------------------------------------------|
| T1  | Cork T <sub>E</sub> X text encoding                  |
| OT1 | old T <sub>E</sub> X text encoding                   |
| U   | unknown encoding                                     |
| OML | old T <sub>E</sub> X math letters encoding           |
| OMS | old T <sub>E</sub> X math symbols encoding           |
| OMX | old T <sub>E</sub> X math extension symbols encoding |
| TU  | Unicode                                              |

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the  $\text{\TeX}$  user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official  $\text{\TeX}$  text encoding.

**Warning:** If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all  $\text{\LaTeX}$  installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

### 3 The `docstrip` modules

The following modules are used to direct `docstrip` in generating external files:

|         |                                                |
|---------|------------------------------------------------|
| driver  | produce a documentation driver file            |
| text    | produce the file <code>fonttext.ltx</code>     |
| math    | produce the file <code>fontmath.ltx</code>     |
| cfgtext | produce a dummy <code>fonttext.cfg</code> file |
| cfgmath | produce a dummy <code>fontmath.cfg</code> file |

A typical `docstrip` command file would then have entries like:

```
generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}
```

### 4 A driver for this document

The next bit of code contains the documentation driver file for  $\text{\TeX}$ , i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the `DOCSTRIP` program.

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
4 \begin{document}
5 \DocInput{fontdef.dtx}
6 \end{document}
7
```

### 5 The `fonttext.ltx` file

The identification is done earlier on with a `\ProvidesFile` declaration.

```
8 <*text>
9 \typeout{== Don't modify this file, use a .cfg file instead ==^J}
```

## 5.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `ltoutenc.dtx`.

By convention, text encoding specific declarations, including the `\DeclareFontEncoding` declaration, are kept in separate file of the form `<enc>enc.def`, e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```
10 \input {omlenc.def}
11 \input {omsenc.def}
```

Documents containing a lot of accented characters should really be using T1 fonts. We therefore load this last so that T1 encoding specific commands are executed as fast as possible (encoding files are no longer reloaded in `fontenc`).

```
12 \input {ot1enc.def}
13 \input {t1enc.def}
14 \input{ts1enc.def}
15 \ifx\Umathcode\@undefined
```

We then set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```
16 \fontencoding{OT1}
```

The initial `fontenc` package load list if an 8-bit TeX engine is used:

```
17 \def\@fontenc@load@list{\@elt{T1,OT1}}
18 \def\rmsubstdefault{cmr}
19 \def\sfsubstdefault{cmss}
20 \def\ttsubstdefault{cmtt}
21 \LoadFontDefinitionFile{TS1}{cmr}
22 \else
```

Unicode.

```
23 \input {tuenc.def}
24 \fontencoding{TU}
```

The initial `fontenc` package load list if a Unicode engine is used:

```
25 \def\@fontenc@load@list{\@elt{TU}}
26 \DeclareFontSubstitution{TU}{lmr}{m}{n}
27 \LoadFontDefinitionFile{TU}{lmr}
28 \LoadFontDefinitionFile{TU}{lmss}
29 \LoadFontDefinitionFile{TU}{lmtt}
30 \def\rmsubstdefault{lmr}
31 \def\sfsubstdefault{lmss}
32 \def\ttsubstdefault{lmtt}
33 \LoadFontDefinitionFile{TS1}{lmr}
```

```
34 \DeclareFontSubstitution{TU}{lmr}{m}{n}
```

End of Unicode branch.

```
35 \fi
```

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

```
36 \DeclareFontEncodingDefaults{}{}
```

Then we define the default substitution for every encoding. This release of L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

```
37 \DeclareFontSubstitution{T1}{cmr}{m}{n}
```

```
38 \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

For every encoding declaration, L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered. L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the corresponding .fd files now. If we don't do this they would be loaded at verification time (i.e. at `\begin{document}`) which would delay processing unnecessarily.

**Warning:** Please note that this means that you have to regenerate the format whenever you change any of these .fd files since L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  will not read .fd files if it already knows about the encoding/family combination.

The `\nfss@catcodes` ensures that white space is ignored in any definitions made in the fd files.

```
39 \begingroup
40 \nfss@catcodes
41 \input {t1cmr.fd}
42 \input {ot1cmr.fd}
43 \endgroup
```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading .fd files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every T<sub>E</sub>X installation, while the amount of main memory is not a limiting factor at most installations.)

```
44 \begingroup
45 \nfss@catcodes
46 \input {ot1cmss.fd}
47 \input {ot1cmtt.fd}
48 \endgroup
```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a `.fd` file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```
49 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}
```

This means, “if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding”. You can change the font used but the encoding should be the same as the one specified with `\fontencoding` above.

## 5.2 Defaults

To allow the use of `\rmfamily`, `\sffamily`, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for `\encodingdefault`) without making documents non-portable.

|                               |                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>\encodingdefault</code> | The following three definitions set up the meaning for <code>\rmfamily</code> , <code>\sffamily</code> , and <code>\ttfamily</code> . |
| <code>\rmdefault</code>       | <code>\ifx\Umathcode\@undefined</code>                                                                                                |
| <code>\sfdefault</code>       | <code>\newcommand\encodingdefault{OT1}</code>                                                                                         |
| <code>\ttdefault</code>       | <code>\newcommand\rmdefault{cmr}</code>                                                                                               |
|                               | <code>\newcommand\sffamily{cmss}</code>                                                                                               |
|                               | <code>\newcommand\ttdefault{cmtt}</code>                                                                                              |
|                               | <code>\else</code>                                                                                                                    |
|                               | <code>\newcommand\encodingdefault{TU}</code>                                                                                          |
|                               | <code>\newcommand\rmdefault{lmr}</code>                                                                                               |
|                               | <code>\fontfamily{\rmdefault}</code>                                                                                                  |
|                               | <code>\newcommand\sffamily{lmss}</code>                                                                                               |
|                               | <code>\newcommand\ttdefault{lmtt}</code>                                                                                              |
|                               | <code>\fi</code>                                                                                                                      |
|                               | <code>&lt;/text&gt;</code>                                                                                                            |
|                               | <code>\langle latexrelease \rangle \IncludeInRelease{2017/01/01} %</code>                                                             |
|                               | <code>\langle latexrelease \rangle \encodingdefault{TU encoding default} %</code>                                                     |
|                               | <code>\langle latexrelease \rangle \ifx\Umathcode\@undefined</code>                                                                   |
|                               | <code>\langle latexrelease \rangle \renewcommand\encodingdefault{OT1}</code>                                                          |
|                               | <code>\langle latexrelease \rangle \fontencoding{\encodingdefault}</code>                                                             |
|                               | <code>\langle latexrelease \rangle \renewcommand\rmdefault{cmr}</code>                                                                |
|                               | <code>\langle latexrelease \rangle \fontfamily{\rmdefault}</code>                                                                     |
|                               | <code>\langle latexrelease \rangle \renewcommand\sffamily{cmss}</code>                                                                |
|                               | <code>\langle latexrelease \rangle \renewcommand\ttdefault{cmtt}</code>                                                               |
|                               | <code>\langle latexrelease \rangle \else</code>                                                                                       |
|                               | <code>\langle latexrelease \rangle \renewcommand\encodingdefault{TU}</code>                                                           |
|                               | <code>\langle latexrelease \rangle %done in every job \fontencoding{\encodingdefault}</code>                                          |
|                               | <code>\langle latexrelease \rangle \renewcommand\rmdefault{lmr}</code>                                                                |
|                               | <code>\langle latexrelease \rangle \fontfamily{\rmdefault}</code>                                                                     |
|                               | <code>\langle latexrelease \rangle \renewcommand\sffamily{lmss}</code>                                                                |
|                               | <code>\langle latexrelease \rangle \renewcommand\ttdefault{lmtt}</code>                                                               |
|                               | <code>\langle latexrelease \rangle \fi</code>                                                                                         |
|                               | <code>\langle latexrelease \rangle \EndIncludeInRelease</code>                                                                        |
|                               | <code>\langle latexrelease \rangle \IncludeInRelease{0000/00/00} %</code>                                                             |
|                               | <code>\langle latexrelease \rangle \encodingdefault{TU encoding default} %</code>                                                     |

```

83 \let\fontencoding{\OT1}
84 \let\renewcommand\encodingdefault{\OT1}
85 \let\fontencoding{\encodingdefault}
86 \let\renewcommand\rmdefault{cmr}
87 \let\fontfamily{\rmdefault}
88 \let\renewcommand\sffamily{\cmss}
89 \let\renewcommand\ttdefault{\cmtt}
90 \EndIncludeInRelease
91 {*text}

```

(End definition for `\encodingdefault` and others.)

`\bfdefault` Series changing commands are influenced by the following hooks.  
`\mddefault` 92 `\newcommand\bfdefault{b}` % overwritten below (for rollback)  
93 `\newcommand\mddefault{m}` % overwritten below (for rollback)

(End definition for `\bfdefault` and `\mddefault`.)

`\itdefault` Shape changing commands use the following hooks.

`\sldefault` 94 `\newcommand\itdefault{it}`  
`\scdefault` 95 `\newcommand\sldefault{sl}`  
`\updefault` 96 `\newcommand\scdefault{sc}`  
97 `\newcommand\updefault{up}` % overwritten below (for rollback)

(End definition for `\itdefault` and others.)

```

98 {/text}
99 {*text | \textrun}
100 \let\IncludeInRelease{\@empty}
101 \let\updefault{\@empty} % font defaults change}
102 % \begin{macrocode}
103 \renewcommand\updefault{up}

```

We append `\@empty` to the series value so that we can detect if it got changed via `\def` or `\renewcommand` later.

```

104 \renewcommand\bfdefault{b\@empty}
105 \renewcommand\mddefault{m\@empty}
106 \let\bfdefault@previous\bfdefault
107 \let\mddefault@previous\mddefault
108 {/text | \textrun}
109 \let\EndIncludeInRelease{\@empty}
110 \let\IncludeInRelease{\@empty} % font defaults change}
111 \let\updefault{\@empty} % font defaults change}
112 \let\renewcommand\updefault{n}
113 \let\renewcommand\bfdefault{bx}
114 \let\renewcommand\mddefault{m}
115 \let\renewcommand\updefault{up}
116 \let\bfdefault@previous\undefined
117 \let\mddefault@previous\undefined
118 \let\EndIncludeInRelease{\@empty}
119 {*text}

```

\familydefault Finally we have the hooks that describe the behaviour of the `\normalfont` command.  
\seriesdefault To stay portable, the definition of `\encodingdefault` should *not* be changed and should  
\shapedefault match the setting above for `\fontencoding`. All other values can be set according to  
your taste.

```
120 \newcommand\familydefault{\rmdefault}
121 \newcommand\seriesdefault{\mddefault}
```

In previous releases `\shapedefault` pointed to `\updefault` which resolved to `n`, but  
these days that is no longer the case (and up is wrong when you want to do a reset. So  
we now use `n` explicitly.

```
122 \newcommand\shapedefault{n}
```

(End definition for `\familydefault`, `\seriesdefault`, and `\shapedefault`.)

This finishes the low-level setup in `fonttext.ltx`.

```
123 </text>
```

## 6 The fontmath.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```
124 <*math>
125 \typeout{== Don't modify this file, use a .cfg file instead ==^J}
```

### 6.1 The font encodings used

```
126 \DeclareFontEncoding{OML}{}{}
127 \DeclareFontEncoding{OMS}{}{}
128 \DeclareFontEncoding{OMX}{}{}
```

Finally a declaration for U encoding which serves for all fonts that do not fit standard  
encodings. For math this sets up `\noaccents@` providing for AMS-L<sup>A</sup>T<sub>E</sub>X. This macro  
is used therein to handle accented characters if they are not supported by the font. In  
other words, if fonts with U encoding are used in math, all accents (like from `\breve`) are  
obtained from some other font that has them.

```
129 \DeclareFontEncoding{U}{}{\noaccents@}
```

The encodings for math are next:

```
130 \DeclareFontSubstitution{OML}{cmm}{m}{it}
131 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
132 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
133 \DeclareFontSubstitution{U}{cmr}{m}{n}

134 \begingroup
135 \nfss@catcodes
136 \input {omlcmm.fd}
137 \input {oms cmsy.fd}
138 \input {omx cmex.fd}
139 \input {ucmr.fd}
140 \endgroup
```

#### 6.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by L<sup>A</sup>T<sub>E</sub>X. These four symbol fonts must be  
defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing  
the ability to process documents written at other sites, as long as one defines the same

symbol font names with the same encodings, e.g. `operators` with OT1 etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```

141 \DeclareSymbolFont{operators} {OT1}{cmr} {m}{n}
142 \DeclareSymbolFont{letters} {OML}{cmm} {m}{it}
143 \DeclareSymbolFont{symbols} {OMS}{cmsy}{m}{n}
144 \DeclareSymbolFont{largesymbols}{OMX}{cmex}{m}{n}

145 \SetSymbolFont{operators}{bold}{OT1}{cmr}{bx}{n}
146 \SetSymbolFont{letters} {bold}{OML}{cmm}{b}{it}
147 \SetSymbolFont{symbols} {bold}{OMS}{cmsy}{b}{n}

```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```

148 \DeclareSymbolFontAlphabet{\mathrm}{operators}
149 \DeclareSymbolFontAlphabet{\mathrmnormal}{letters}
150 \DeclareSymbolFontAlphabet{\mathcal}{symbols}
151 \DeclareMathAlphabet{\mathbf}{OT1}{cmr}{bx}{n}
152 \DeclareMathAlphabet{\mathsf}{OT1}{cmss}{m}{n}
153 \DeclareMathAlphabet{\mathit}{OT1}{cmr}{m}{it}
154 \DeclareMathAlphabet{\mathtt}{OT1}{cmtt}{m}{n}

```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```

155 \SetMathAlphabet{\mathsf}{bold}{OT1}{cmss}{bx}{n}
156 \SetMathAlphabet{\mathit}{bold}{OT1}{cmr}{bx}{it}

```

## 6.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```

157 \DeclareMathSizes{5}{5}{5}{5}
158 \DeclareMathSizes{6}{6}{5}{5}
159 \DeclareMathSizes{7}{7}{5}{5}
160 \DeclareMathSizes{8}{8}{6}{5}
161 \DeclareMathSizes{9}{9}{6}{5}
162 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
163 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
164 \DeclareMathSizes{\@xiipt}{\@xiipt}{8}{6}
165 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
166 \DeclareMathSizes{\@xviipt}{\@xviipt}{\@xiipt}{\@xpt}
167 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xiipt}
168 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xviipt}

```

## 6.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by InTeX. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

### 6.3.1 The letters

```
169 \DeclareMathSymbol{a}{\mathalpha}{letters}{`a}
170 \DeclareMathSymbol{b}{\mathalpha}{letters}{`b}
171 \DeclareMathSymbol{c}{\mathalpha}{letters}{`c}
172 \DeclareMathSymbol{d}{\mathalpha}{letters}{`d}
173 \DeclareMathSymbol{e}{\mathalpha}{letters}{`e}
174 \DeclareMathSymbol{f}{\mathalpha}{letters}{`f}
175 \DeclareMathSymbol{g}{\mathalpha}{letters}{`g}
176 \DeclareMathSymbol{h}{\mathalpha}{letters}{`h}
177 \DeclareMathSymbol{i}{\mathalpha}{letters}{`i}
178 \DeclareMathSymbol{j}{\mathalpha}{letters}{`j}
179 \DeclareMathSymbol{k}{\mathalpha}{letters}{`k}
180 \DeclareMathSymbol{l}{\mathalpha}{letters}{`l}
181 \DeclareMathSymbol{m}{\mathalpha}{letters}{`m}
182 \DeclareMathSymbol{n}{\mathalpha}{letters}{`n}
183 \DeclareMathSymbol{o}{\mathalpha}{letters}{`o}
184 \DeclareMathSymbol{p}{\mathalpha}{letters}{`p}
185 \DeclareMathSymbol{q}{\mathalpha}{letters}{`q}
186 \DeclareMathSymbol{r}{\mathalpha}{letters}{`r}
187 \DeclareMathSymbol{s}{\mathalpha}{letters}{`s}
188 \DeclareMathSymbol{t}{\mathalpha}{letters}{`t}
189 \DeclareMathSymbol{u}{\mathalpha}{letters}{`u}
190 \DeclareMathSymbol{v}{\mathalpha}{letters}{`v}
191 \DeclareMathSymbol{w}{\mathalpha}{letters}{`w}
192 \DeclareMathSymbol{x}{\mathalpha}{letters}{`x}
193 \DeclareMathSymbol{y}{\mathalpha}{letters}{`y}
194 \DeclareMathSymbol{z}{\mathalpha}{letters}{`z}

195 \DeclareMathSymbol{A}{\mathalpha}{letters}{`A}
196 \DeclareMathSymbol{B}{\mathalpha}{letters}{`B}
197 \DeclareMathSymbol{C}{\mathalpha}{letters}{`C}
198 \DeclareMathSymbol{D}{\mathalpha}{letters}{`D}
199 \DeclareMathSymbol{E}{\mathalpha}{letters}{`E}
200 \DeclareMathSymbol{F}{\mathalpha}{letters}{`F}
201 \DeclareMathSymbol{G}{\mathalpha}{letters}{`G}
202 \DeclareMathSymbol{H}{\mathalpha}{letters}{`H}
203 \DeclareMathSymbol{I}{\mathalpha}{letters}{`I}
204 \DeclareMathSymbol{J}{\mathalpha}{letters}{`J}
205 \DeclareMathSymbol{K}{\mathalpha}{letters}{`K}
206 \DeclareMathSymbol{L}{\mathalpha}{letters}{`L}
207 \DeclareMathSymbol{M}{\mathalpha}{letters}{`M}
208 \DeclareMathSymbol{N}{\mathalpha}{letters}{`N}
209 \DeclareMathSymbol{O}{\mathalpha}{letters}{`O}
210 \DeclareMathSymbol{P}{\mathalpha}{letters}{`P}
211 \DeclareMathSymbol{Q}{\mathalpha}{letters}{`Q}
212 \DeclareMathSymbol{R}{\mathalpha}{letters}{`R}
213 \DeclareMathSymbol{S}{\mathalpha}{letters}{`S}
```

```

214 \DeclareMathSymbol{T}{\mathalpha}{letters}{`T}
215 \DeclareMathSymbol{U}{\mathalpha}{letters}{`U}
216 \DeclareMathSymbol{V}{\mathalpha}{letters}{`V}
217 \DeclareMathSymbol{W}{\mathalpha}{letters}{`W}
218 \DeclareMathSymbol{X}{\mathalpha}{letters}{`X}
219 \DeclareMathSymbol{Y}{\mathalpha}{letters}{`Y}
220 \DeclareMathSymbol{Z}{\mathalpha}{letters}{`Z}

```

### 6.3.2 The digits

```

221 \DeclareMathSymbol{0}{\mathalpha}{operators}{`0}
222 \DeclareMathSymbol{1}{\mathalpha}{operators}{`1}
223 \DeclareMathSymbol{2}{\mathalpha}{operators}{`2}
224 \DeclareMathSymbol{3}{\mathalpha}{operators}{`3}
225 \DeclareMathSymbol{4}{\mathalpha}{operators}{`4}
226 \DeclareMathSymbol{5}{\mathalpha}{operators}{`5}
227 \DeclareMathSymbol{6}{\mathalpha}{operators}{`6}
228 \DeclareMathSymbol{7}{\mathalpha}{operators}{`7}
229 \DeclareMathSymbol{8}{\mathalpha}{operators}{`8}
230 \DeclareMathSymbol{9}{\mathalpha}{operators}{`9}

```

### 6.3.3 Punctuation, brace, etc. keys

```

231 \DeclareMathSymbol{!}{\mathclose}{operators}{`21}
232 \DeclareMathSymbol{*}{\mathbin}{symbols}{`03} % \ast
233 \DeclareMathSymbol{+}{\mathbin}{operators}{`2B}
234 \DeclareMathSymbol{,}{\mathpunct}{letters}{`3B}
235 \DeclareMathSymbol{-}{\mathbin}{symbols}{`00}
236 \DeclareMathSymbol{.}{\mathord}{letters}{`3A}
237 \DeclareMathSymbol{:}{\mathrel}{operators}{`3A}
238 \DeclareMathSymbol{;}{\mathpunct}{operators}{`3B}
239 \DeclareMathSymbol{=}{\mathrel}{operators}{`3D}
240 \DeclareMathSymbol{?}{\mathclose}{operators}{`3F}

```

The following symbols are defined as delimiters below which automatically defines them as math symbols.

```

241 \% \DeclareMathSymbol{()}{\mathopen}{operators}{`28}
242 \% \DeclareMathSymbol{}{)}{\mathclose}{operators}{`29}
243 \% \DeclareMathSymbol{/}{\mathord}{letters}{`3D}
244 \% \DeclareMathSymbol{[]}{\mathopen}{operators}{`5B}
245 \% \DeclareMathSymbol{}{]}{\mathclose}{operators}{`5D}
246 \% \DeclareMathSymbol{|}{\mathord}{symbols}{`6A}
247 \% \DeclareMathSymbol{<}{\mathrel}{letters}{`3C}
248 \% \DeclareMathSymbol{>}{\mathrel}{letters}{`3E}

```

Should all of the following being activated by default? Probably not.

```

249 \% \DeclareMathSymbol{'{}{\mathopen}{symbols}{`66}
250 \% \DeclareMathSymbol{'{}{\mathclose}{symbols}{`67}
251 \% \DeclareMathSymbol{'\\}{\mathord}{symbols}{`6E} % \backslash
252 \mathcode`\"=8000 % \space
253 \mathcode`'=8000 % ^\prime
254 \mathcode`_="8000 % \

```

### 6.3.4 Delimitercodes for characters

[to be completed]

Finally,  $\text{\rm Init}\text{\rm EX}$  sets all  $\text{\rm \delcode}$  values to -1, except  $\text{\rm \delcode'=.0}$

```

255 \DeclareMathDelimiter{()}{\mathopen}{operators}{28}{largesymbols}{00}
256 \DeclareMathDelimiter{}{\mathclose}{operators}{29}{largesymbols}{01}
257 \DeclareMathDelimiter{[]}{\mathopen}{operators}{5B}{largesymbols}{02}
258 \DeclareMathDelimiter{}{\mathclose}{operators}{5D}{largesymbols}{03}

```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain TeX. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```

259 \DeclareMathDelimiter{<}{\mathopen}{symbols}{68}{largesymbols}{0A}
260 \DeclareMathDelimiter{>}{\mathclose}{symbols}{69}{largesymbols}{0B}
261 \DeclareMathSymbol{<}{\mathrel}{letters}{3C}
262 \DeclareMathSymbol{>}{\mathrel}{letters}{3E}

```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```

263 \DeclareMathDelimiter{/}{\mathord}{operators}{2F}{largesymbols}{0E}
264 \DeclareMathSymbol{/}{\mathord}{letters}{3D}
265 \DeclareMathDelimiter{|}{\mathord}{symbols}{6A}{largesymbols}{0C}
266 \expandafter\DeclareMathDelimiter@\backslashchar
267 \mathord{symbols}{6E}{largesymbols}{0F}

```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

## 6.4 Symbols accessed via control sequences

### 6.4.1 Greek letters

```

268 \DeclareMathSymbol{\alpha}{\mathord}{letters}{0B}
269 \DeclareMathSymbol{\beta}{\mathord}{letters}{0C}
270 \DeclareMathSymbol{\gamma}{\mathord}{letters}{0D}
271 \DeclareMathSymbol{\delta}{\mathord}{letters}{0E}
272 \DeclareMathSymbol{\epsilon}{\mathord}{letters}{0F}
273 \DeclareMathSymbol{\zeta}{\mathord}{letters}{10}
274 \DeclareMathSymbol{\eta}{\mathord}{letters}{11}
275 \DeclareMathSymbol{\theta}{\mathord}{letters}{12}
276 \DeclareMathSymbol{\iota}{\mathord}{letters}{13}
277 \DeclareMathSymbol{\kappa}{\mathord}{letters}{14}
278 \DeclareMathSymbol{\lambda}{\mathord}{letters}{15}
279 \DeclareMathSymbol{\mu}{\mathord}{letters}{16}
280 \DeclareMathSymbol{\nu}{\mathord}{letters}{17}
281 \DeclareMathSymbol{\xi}{\mathord}{letters}{18}
282 \DeclareMathSymbol{\pi}{\mathord}{letters}{19}
283 \DeclareMathSymbol{\rho}{\mathord}{letters}{1A}
284 \DeclareMathSymbol{\sigma}{\mathord}{letters}{1B}
285 \DeclareMathSymbol{\tau}{\mathord}{letters}{1C}
286 \DeclareMathSymbol{\upsilon}{\mathord}{letters}{1D}
287 \DeclareMathSymbol{\phi}{\mathord}{letters}{1E}
288 \DeclareMathSymbol{\chi}{\mathord}{letters}{1F}
289 \DeclareMathSymbol{\psi}{\mathord}{letters}{20}
290 \DeclareMathSymbol{\omega}{\mathord}{letters}{21}
291 \DeclareMathSymbol{\varepsilon}{\mathord}{letters}{22}
292 \DeclareMathSymbol{\vartheta}{\mathord}{letters}{23}
293 \DeclareMathSymbol{\varpi}{\mathord}{letters}{24}

```

```

294 \DeclareMathSymbol{\varrho}{\mathord}{letters}{"25}
295 \DeclareMathSymbol{\varsigma}{\mathord}{letters}{"26}
296 \DeclareMathSymbol{\varphi}{\mathord}{letters}{"27}
297 \DeclareMathSymbol{\Gamma}{\mathalpha}{operators}{"00}
298 \DeclareMathSymbol{\Delta}{\mathalpha}{operators}{"01}
299 \DeclareMathSymbol{\Theta}{\mathalpha}{operators}{"02}
300 \DeclareMathSymbol{\Lambda}{\mathalpha}{operators}{"03}
301 \DeclareMathSymbol{\Xi}{\mathalpha}{operators}{"04}
302 \DeclareMathSymbol{\Pi}{\mathalpha}{operators}{"05}
303 \DeclareMathSymbol{\Sigma}{\mathalpha}{operators}{"06}
304 \DeclareMathSymbol{\Upsilon}{\mathalpha}{operators}{"07}
305 \DeclareMathSymbol{\Phi}{\mathalpha}{operators}{"08}
306 \DeclareMathSymbol{\Psi}{\mathalpha}{operators}{"09}
307 \DeclareMathSymbol{\Omega}{\mathalpha}{operators}{"0A}

```

#### 6.4.2 Ordinary symbols

```

308 \DeclareMathSymbol{\aleph}{\mathord}{symbols}{"40}
309 \DeclareMathSymbol{\imath}{\mathord}{letters}{"7B}
310 \DeclareMathSymbol{\jmath}{\mathord}{letters}{"7C}
311 \DeclareMathSymbol{\ell}{\mathord}{letters}{"60}
312 \DeclareMathSymbol{\wp}{\mathord}{letters}{"7D}
313 \DeclareMathSymbol{\Re}{\mathord}{symbols}{"3C}
314 \DeclareMathSymbol{\Im}{\mathord}{symbols}{"3D}
315 \DeclareMathSymbol{\partial}{\mathord}{letters}{"40}
316 \DeclareMathSymbol{\infty}{\mathord}{symbols}{"31}
317 \DeclareMathSymbol{\prime}{\mathord}{symbols}{"30}
318 \DeclareMathSymbol{\emptyset}{\mathord}{symbols}{"3B}
319 \DeclareMathSymbol{\nabla}{\mathord}{symbols}{"72}
320 \DeclareMathSymbol{\top}{\mathord}{symbols}{"3E}
321 \DeclareMathSymbol{\bot}{\mathord}{symbols}{"3F}
322 \DeclareMathSymbol{\triangle}{\mathord}{symbols}{"34}
323 \DeclareMathSymbol{\forall}{\mathord}{symbols}{"38}
324 \DeclareMathSymbol{\exists}{\mathord}{symbols}{"39}
325 \DeclareMathSymbol{\neg}{\mathord}{symbols}{"3A}

```

Alias:

```

326 % \let\lnot=\neg
327 \DeclareMathSymbol{\lnot}{\mathord}{symbols}{"3A}
328 \DeclareMathSymbol{\flat}{\mathord}{letters}{"5B}
329 \DeclareMathSymbol{\natural}{\mathord}{letters}{"5C}
330 \DeclareMathSymbol{\sharp}{\mathord}{letters}{"5D}
331 \DeclareMathSymbol{\clubsuit}{\mathord}{symbols}{"7C}
332 \DeclareMathSymbol{\diamondsuit}{\mathord}{symbols}{"7D}
333 \DeclareMathSymbol{\heartsuit}{\mathord}{symbols}{"7E}
334 \DeclareMathSymbol{\spadesuit}{\mathord}{symbols}{"7F}

335 \ DeclareRobustCommand{\hbar}{\mathchar'26\mkern-9mu h}
336 \ DeclareRobustCommand{\surd}{\mathchar"1270}
337 \ DeclareRobustCommand{\angle}{\vbox{\ialign{$\m@th\scriptstyle##$\crcr
338 \not\mathrel{\mkern14mu}\crcr
339 \noalign{\nointerlineskip}
340 \mkern2.5mu\leaders\hrule\height.34pt\hfill\mkern2.5mu\crcr}}}

```

#### 6.4.3 Large Operators

```

341 \DeclareMathSymbol{\coprod}{\mathop}{largesymbols}{"60}

```

```

342 \DeclareMathSymbol{\bigvee}{\mathop}{largesymbols}{57}
343 \DeclareMathSymbol{\bigwedge}{\mathop}{largesymbols}{56}
344 \DeclareMathSymbol{\biguplus}{\mathop}{largesymbols}{55}
345 \DeclareMathSymbol{\bigcap}{\mathop}{largesymbols}{54}
346 \DeclareMathSymbol{\bigcup}{\mathop}{largesymbols}{53}
347 \DeclareMathSymbol{\intop}{\mathop}{largesymbols}{52}
348 \ DeclareRobustCommand\int{\intop\nolimits}
349 \DeclareMathSymbol{\prod}{\mathop}{largesymbols}{51}
350 \DeclareMathSymbol{\sum}{\mathop}{largesymbols}{50}
351 \DeclareMathSymbol{\bigotimes}{\mathop}{largesymbols}{4E}
352 \DeclareMathSymbol{\bigoplus}{\mathop}{largesymbols}{4C}
353 \DeclareMathSymbol{\bigodot}{\mathop}{largesymbols}{4A}
354 \DeclareMathSymbol{\ointop}{\mathop}{largesymbols}{48}
355 \ DeclareRobustCommand\oint{\ointop\nolimits}
356 \DeclareMathSymbol{\bigsqcup}{\mathop}{largesymbols}{46}
357 \DeclareMathSymbol{\smallint}{\mathop}{symbols}{73}

```

#### 6.4.4 Binary symbols

```

358 \DeclareMathSymbol{\triangleleft}{\mathbin}{letters}{2F}
359 \DeclareMathSymbol{\triangleright}{\mathbin}{letters}{2E}
360 \DeclareMathSymbol{\bigtriangleup}{\mathbin}{symbols}{34}
361 \DeclareMathSymbol{\bigtriangledown}{\mathbin}{symbols}{35}

```

Alias:

```

362 % \let \varbigtriangledown \bigtriangledown
363 % \let \varbigtriangleup \bigtriangleup
364 \DeclareMathSymbol{\varbigtriangleup}{\mathbin}{symbols}{34}
365 \DeclareMathSymbol{\varbigtriangledown}{\mathbin}{symbols}{35}

```

These last two synonyms are needed because the `stmaryrd` package redefines them as Operators.

```

366 \DeclareMathSymbol{\wedge}{\mathbin}{symbols}{5E}
367 \DeclareMathSymbol{\vee}{\mathbin}{symbols}{5F}

```

Alias:

```

368 % \let\land=\wedge
369 % \let\lor=\vee
370 \DeclareMathSymbol{\land}{\mathbin}{symbols}{5E}
371 \DeclareMathSymbol{\lor}{\mathbin}{symbols}{5F}
372 \DeclareMathSymbol{\cap}{\mathbin}{symbols}{5C}
373 \DeclareMathSymbol{\cup}{\mathbin}{symbols}{5B}
374 \DeclareMathSymbol{\ddagger}{\mathbin}{symbols}{7A}
375 \DeclareMathSymbol{\dagger}{\mathbin}{symbols}{79}
376 \DeclareMathSymbol{\sqcap}{\mathbin}{symbols}{75}
377 \DeclareMathSymbol{\sqcup}{\mathbin}{symbols}{74}
378 \DeclareMathSymbol{\uplus}{\mathbin}{symbols}{5D}
379 \DeclareMathSymbol{\amalg}{\mathbin}{symbols}{71}
380 \DeclareMathSymbol{\diamond}{\mathbin}{symbols}{05}
381 \DeclareMathSymbol{\bullet}{\mathbin}{symbols}{0F}
382 \DeclareMathSymbol{\wr}{\mathbin}{symbols}{6F}
383 \DeclareMathSymbol{\div}{\mathbin}{symbols}{04}
384 \DeclareMathSymbol{\odot}{\mathbin}{symbols}{0C}
385 \DeclareMathSymbol{\oslash}{\mathbin}{symbols}{0B}
386 \DeclareMathSymbol{\otimes}{\mathbin}{symbols}{0A}
387 \DeclareMathSymbol{\ominus}{\mathbin}{symbols}{09}

```

```

388 \DeclareMathSymbol{\oplus}{\mathbin}{symbols}{08}
389 \DeclareMathSymbol{\mp}{\mathbin}{symbols}{07}
390 \DeclareMathSymbol{\pm}{\mathbin}{symbols}{06}
391 \DeclareMathSymbol{\circ}{\mathbin}{symbols}{0E}
392 \DeclareMathSymbol{\bigcirc}{\mathbin}{symbols}{0D}
393 \DeclareMathSymbol{\setminus}{\mathbin}{symbols}{6E}
394 \DeclareMathSymbol{\cdotp}{\mathbin}{symbols}{01}
395 \DeclareMathSymbol{\ast}{\mathbin}{symbols}{03}
396 \DeclareMathSymbol{\times}{\mathbin}{symbols}{02}
397 \DeclareMathSymbol{\star}{\mathbin}{letters}{3F}

```

#### 6.4.5 Relations

```

398 \DeclareMathSymbol{\propto}{\mathrel}{symbols}{2F}
399 \DeclareMathSymbol{\sqsubseteq}{\mathrel}{symbols}{76}
400 \DeclareMathSymbol{\sqsupseteq}{\mathrel}{symbols}{77}
401 \DeclareMathSymbol{\parallel}{\mathrel}{symbols}{6B}
402 \DeclareMathSymbol{\mid}{\mathrel}{symbols}{6A}
403 \DeclareMathSymbol{\dashv}{\mathrel}{symbols}{61}
404 \DeclareMathSymbol{\vdash}{\mathrel}{symbols}{60}
405 \DeclareMathSymbol{\nearrow}{\mathrel}{symbols}{25}
406 \DeclareMathSymbol{\searrow}{\mathrel}{symbols}{26}
407 \DeclareMathSymbol{\nwarrow}{\mathrel}{symbols}{2D}
408 \DeclareMathSymbol{\swarrow}{\mathrel}{symbols}{2E}
409 \DeclareMathSymbol{\Leftrightarrow}{\mathrel}{symbols}{2C}
410 \DeclareMathSymbol{\Leftarrow}{\mathrel}{symbols}{28}
411 \DeclareMathSymbol{\Rightarrow}{\mathrel}{symbols}{29}
412 \DeclareRobustCommand{\neq}{\not=}

```

As `\neq` is robust we should not use `\let` to define `\ne` as then it would change if `\neq` changes.

```
413 \DeclareRobustCommand{\ne}{\not=}
```

It would ok to use `\let` for those declared by `\DeclareMathSymbol` but for a cleaner interface we avoid it always (just in case the internals change).

```
414 \DeclareMathSymbol{\leq}{\mathrel}{symbols}{14}
415 \DeclareMathSymbol{\geq}{\mathrel}{symbols}{15}
```

Alias:

```

416 % \let\le=\leq
417 % \let\ge=\geq
418 \DeclareMathSymbol{\le}{\mathrel}{symbols}{14}
419 \DeclareMathSymbol{\ge}{\mathrel}{symbols}{15}
420 \DeclareMathSymbol{\succ}{\mathrel}{symbols}{1F}
421 \DeclareMathSymbol{\prec}{\mathrel}{symbols}{1E}
422 \DeclareMathSymbol{\approx}{\mathrel}{symbols}{19}
423 \DeclareMathSymbol{\succeq}{\mathrel}{symbols}{17}
424 \DeclareMathSymbol{\preceq}{\mathrel}{symbols}{16}
425 \DeclareMathSymbol{\supset}{\mathrel}{symbols}{1B}
426 \DeclareMathSymbol{\subset}{\mathrel}{symbols}{1A}
427 \DeclareMathSymbol{\supseteq}{\mathrel}{symbols}{13}
428 \DeclareMathSymbol{\subseteq}{\mathrel}{symbols}{12}
429 \DeclareMathSymbol{\in}{\mathrel}{symbols}{32}
430 \DeclareMathSymbol{\ni}{\mathrel}{symbols}{33}

```

Alias:

```
431 % \let\owns=\ni
```

```

432 \DeclareMathSymbol{\owns}{\mathrel}{symbols}{33}
433 \DeclareMathSymbol{\gg}{\mathrel}{symbols}{1D}
434 \DeclareMathSymbol{\ll}{\mathrel}{symbols}{1C}
435 \DeclareMathSymbol{\not}{\mathrel}{symbols}{36}
436 \DeclareMathSymbol{\leftrightarrow}{\mathrel}{symbols}{24}
437 \DeclareMathSymbol{\leftarrow}{\mathrel}{symbols}{20}
438 \DeclareMathSymbol{\rightarrow}{\mathrel}{symbols}{21}

Alias:
439 % \let\gets=\leftarrow
440 % \let\to=\rightarrow
441 \DeclareMathSymbol{\gets}{\mathrel}{symbols}{20}
442 \DeclareMathSymbol{\to}{\mathrel}{symbols}{21}
443 \DeclareMathSymbol{\mapstochar}{\mathrel}{symbols}{37}
444 \ DeclareRobustCommand{\mapsto}{\mapstochar\rightarrow}
445 \DeclareMathSymbol{\sim}{\mathrel}{symbols}{18}
446 \DeclareMathSymbol{\simeq}{\mathrel}{symbols}{27}
447 \DeclareMathSymbol{\perp}{\mathrel}{symbols}{3F}
448 \DeclareMathSymbol{\equiv}{\mathrel}{symbols}{11}
449 \DeclareMathSymbol{\asymp}{\mathrel}{symbols}{10}
450 \DeclareMathSymbol{\smile}{\mathrel}{letters}{5E}
451 \DeclareMathSymbol{\frown}{\mathrel}{letters}{5F}
452 \DeclareMathSymbol{\leftharpoonup}{\mathrel}{letters}{28}
453 \DeclareMathSymbol{\leftharpoondown}{\mathrel}{letters}{29}
454 \DeclareMathSymbol{\rightharpoonup}{\mathrel}{letters}{2A}
455 \DeclareMathSymbol{\rightharpoondown}{\mathrel}{letters}{2B}

```

Here cometh much profligate robustification of math constructs. Warning: some of these commands may become non-robust if an AMS package is loaded.

Further potential problems: some math font packages may make unfortunate assumptions about some of these definitions that are not true of the robust versions we need.

```

456 \DeclareRobustCommand
457 \cong{\mathrel{\mathpalette\overeq\sim}} % congruence sign
458 \def\overeq#1#2{\lower.5\p@\vbox{\lineskip\maxdimen\lineskip-.5\p@
459 \ialign{$\m@th#1\hfil##\hfil$\crcr#2\crcr=\crcr}}}
460 \DeclareRobustCommand
461 \notin{\mathrel{\mathpalette\cncel\in}}
462 \def\cncel#1#2{\m@th\ooalign{$\hfil#1\mkern1mu/\hfil$\crcr$#1#2$}}
463 \DeclareRobustCommand
464 \rightleftharpoons{\mathrel{\mathpalette\rlh@{}}}
465 \def\rlh@#1{\vcenter{\m@th\hbox{\ooalign{\raise2pt
466 \hbox{$\#1\rightharpoonup$}\crcr
467 $\#1\leftharpoondown$}}}}
468 \DeclareRobustCommand
469 \doteq{\mathrel{\textstyle.\over=}}

```

#### 6.4.6 Arrows

```

470 \DeclareRobustCommand
471 \joinrel{\mathrel{\mkern-3mu}}
472 \DeclareRobustCommand
473 \relbar{\mathrel{\smash-}} % \smash, because -
474 % has the same height as +

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet...`. This might be the case when packages are implementing shorthands for math, e.g. `=` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathequalsign` and use this. However we can’t do this now as it would break other math layouts where characters are in different places (since those wouldn’t know about the need for a new command name).

```

475 \DeclareRobustCommand
476 \Relbar{\mathrel{=}}
477 \DeclareMathSymbol{\lhook}{\mathrel}{letters}{`2C}
478 \DeclareRobustCommand\hookrightarrow{\lhook\joinrel\rightarrow}
479 \DeclareMathSymbol{\rhook}{\mathrel}{letters}{`2D}
480 \DeclareRobustCommand\hookleftarrow{\leftarrow\joinrel\rhook}
481 \DeclareRobustCommand
482 \bowtie{\mathrel\triangleleft\joinrel\mathrel\triangleleft}
483 \DeclareRobustCommand
484 \models{\mathrel{!}\joinrel\Relbar}
485 \DeclareRobustCommand
486 \Longrightarrow{\Relbar\joinrel\rightarrow}

```

LaTeX Change: `\longrightarrow` and `\longleftarrow` redefined to make them robust.

```

487 \DeclareRobustCommand\longrightarrow
488 {\relbar\joinrel\rightarrow}
489 \DeclareRobustCommand\longleftarrow
490 {\leftarrow\joinrel\relbar}
491 \DeclareRobustCommand
492 \Longrightarrow{\Leftarrow\joinrel\Relbar}
493 \DeclareRobustCommand
494 \longmapsto{\mapstochar\longrightarrow}
495 \DeclareRobustCommand
496 \longleftrightarrow{\leftarrow\joinrel\rightarrow}
497 \DeclareRobustCommand
498 \Longleftrightarrow{\Leftarrow\joinrel\Rightarrow}
499 \DeclareRobustCommand
500 \iiff{;}{\Longleftrightarrow{};}

```

#### 6.4.7 Punctuation symbols

```

501 \DeclareMathSymbol{\ldotp}{\mathpunct}{letters}{`3A}
502 \DeclareMathSymbol{\cdotp}{\mathpunct}{symbols}{`01}
503 \DeclareMathSymbol{\colon}{\mathpunct}{operators}{`3A}

```

This is commented out, since `\ldots` is now defined in `ltoutenc.dtx`.

```

504 %\def\@ldots{\mathinner{\ldotp\ldotp\ldotp}}
505 %\ DeclareRobustCommand\ldots
506 % {\relax\ifmmode\@ldots\else\mbox{$\m@th\@ldots$}\fi}
507 \DeclareRobustCommand
508 \cdots{\mathinner{\cdotp\cdotp\cdotp}}
509 \DeclareRobustCommand
510 \vdots{\vbox{\baselineskip4\p@\lineskiplimit\z@
511 \kern6\p@\hbox{.}\hbox{.}\hbox{.}}}
512 \DeclareRobustCommand
513 \ddots{\mathinner{\mkern1mu\raise7\p@
514 \vbox{\kern7\p@\hbox{.}\hbox{.}}\mkern2mu}

```

```
515 \raise4\p@\hbox{.}\mkern2mu\raise\p@\hbox{.}\mkern1mu}}
```

#### 6.4.8 Math accents

```
516 \DeclareMathAccent{\acute}{\mathalpha}{operators}{13}
517 \DeclareMathAccent{\grave}{\mathalpha}{operators}{12}
518 \DeclareMathAccent{\ddot}{\mathalpha}{operators}{7F}
519 \DeclareMathAccent{\tilde}{\mathalpha}{operators}{7E}
520 \DeclareMathAccent{\bar}{\mathalpha}{operators}{16}
521 \DeclareMathAccent{\breve}{\mathalpha}{operators}{15}
522 \DeclareMathAccent{\check}{\mathalpha}{operators}{14}
523 \DeclareMathAccent{\hat}{\mathalpha}{operators}{5E}
524 \DeclareMathAccent{\vec}{\mathord}{letters}{7E}
525 \DeclareMathAccent{\dot}{\mathalpha}{operators}{5F}
526 \DeclareMathAccent{\widetilde}{\mathord}{largesymbols}{65}
527 \DeclareMathAccent{\widehat}{\mathord}{largesymbols}{62}
```

For some reason plain TeX never bothered to provide a ring accent in math (although it is available in the fonts), but since we got a request for it here we go:

```
528 \DeclareMathAccent{\mathring}{\mathalpha}{operators}{17}
```

#### 6.4.9 Radicals

```
529 \DeclareMathRadical{\sqrtsign}{symbols}{70}{largesymbols}{70}
```

#### 6.4.10 Over and under something, etc

```
530 \DeclareRobustCommand\overrightarrow[1]{\vbox{\m@th\ialign{##\crcr
531 \rightarrowfill\crcr\noalign{\kern-\p@\nointerlineskip}
532 $ \hfil\displaystyle{#1} \hfil$ \crcr}}
533 \DeclareRobustCommand\overleftarrow[1]{\vbox{\m@th\ialign{##\crcr
534 \leftarrowfill\crcr\noalign{\kern-\p@\nointerlineskip}
535 $ \hfil\displaystyle{#1} \hfil$ \crcr}}
536 \DeclareRobustCommand\overbrace[1]
537 {\mathop{\vbox{\m@th\ialign{##\crcr\noalign{\kern3\p@}%
538 \downbracefill\crcr\noalign{\kern3\p@\nointerlineskip}%
539 $ \hfil\displaystyle{#1} \hfil$ \crcr}}}\limits}
540 \DeclareRobustCommand\underbrace[1]{\mathop{\vtop{\m@th\ialign{##\crcr
541 $ \hfil\displaystyle{#1} \hfil$ \crcr
542 \noalign{\kern3\p@\nointerlineskip}%
543 \upbracefill\crcr\noalign{\kern3\p@}}}\limits}
```

(quite a waste of tokens, IMHO — Frank)

```
544 \DeclareRobustCommand\skew[3]
545 {{\muskip\z@#1mu\divide\muskip\z@\tw@ \mkern\muskip\z@
546 #2{\mkern-\muskip\z@{#3}\mkern\muskip\z@\mkern-\muskip\z@}{}}}
547 \DeclareRobustCommand\rightarrowfill{$\m@th\smash{-}\mkern-7mu%
548 \cleaders\hbox{$\mkern-2mu\smash{-}\mkern-2mu$}\hfill
549 \mkern-7mu\mathord\rightarrow$}
550 \DeclareRobustCommand\leftarrowfill{$\m@th\mathord\leftarrow\mkern-7mu%
551 \cleaders\hbox{$\mkern-2mu\smash{-}\mkern-2mu$}\hfill
552 \mkern-7mu\smash{-}$}
553 \DeclareMathSymbol{\braceleft}{\mathord}{largesymbols}{7A}
554 \DeclareMathSymbol{\bracerd}{\mathord}{largesymbols}{7B}
555 \DeclareMathSymbol{\bracelu}{\mathord}{largesymbols}{7C}
556 \DeclareMathSymbol{\braceru}{\mathord}{largesymbols}{7D}
557 \DeclareRobustCommand\downbracefill{$\m@th\setbox\z@\hbox{$\braceleft$}%
558 \braceleft\leaders\vrule\height\ht\z@\depth\z@\hfill\braceru
```

```

559 \braceleft\leaders\vrule \@height\ht\z@\@depth\z@\hfill\bracerd$}
560 \DeclareRobustCommand\upbracefill{$\mathop{\setbox\z@\hbox{$\braceleft$}}\limits^{\mathop{\setbox\z@\hbox{\bracerd}}\limits_{\mathop{\setbox\z@\hbox{\bracerd}}\limits}}$}
561 \braceleft\leaders\vrule \@height\ht\z@\@depth\z@\hfill\bracerd
562 \bracerd\leaders\vrule \@height\ht\z@\@depth\z@\hfill\braceru$}

```

#### 6.4.11 Delimiters

```

563 \DeclareMathDelimiter{\lmooustache} % top from (, bottom from)
564 {\mathopen}{largesymbols}{7A}{largesymbols}{40}
565 \DeclareMathDelimiter{\rmoustache} % top from), bottom from (
566 {\mathclose}{largesymbols}{7B}{largesymbols}{41}
567 \DeclareMathDelimiter{\arrowvert} % arrow without arrowheads
568 {\mathord}{symbols}{6A}{largesymbols}{3C}
569 \DeclareMathDelimiter{\Arrowvert} % double arrow without arrowheads
570 {\mathord}{symbols}{6B}{largesymbols}{3D}
571 \DeclareMathDelimiter{\Vert}
572 {\mathord}{symbols}{6B}{largesymbols}{0D}

\DeclareMathDelimiter produces a command that is robust (with an internal macro
containing the payload) so we should not use \let for making an alias
573 \%let\|=Vert
574 \DeclareMathDelimiter{\|}{%
575 {\mathord}{symbols}{6B}{largesymbols}{0D}}
576 \DeclareMathDelimiter{\vert}{%
577 {\mathord}{symbols}{6A}{largesymbols}{0C}}
578 \DeclareMathDelimiter{\uparrow}{%
579 {\mathrel}{symbols}{22}{largesymbols}{78}}
580 \DeclareMathDelimiter{\downarrow}{%
581 {\mathrel}{symbols}{23}{largesymbols}{79}}
582 \DeclareMathDelimiter{\updownarrow}{%
583 {\mathrel}{symbols}{6C}{largesymbols}{3F}}
584 \DeclareMathDelimiter{\Uparrow}{%
585 {\mathrel}{symbols}{2A}{largesymbols}{7E}}
586 \DeclareMathDelimiter{\Downarrow}{%
587 {\mathrel}{symbols}{2B}{largesymbols}{7F}}
588 \DeclareMathDelimiter{\Updownarrow}{%
589 {\mathrel}{symbols}{6D}{largesymbols}{77}}
590 \DeclareMathDelimiter{\backslash}{ % for double coset G\backslash H
591 {\mathord}{symbols}{6E}{largesymbols}{0F}}
592 \DeclareMathDelimiter{\rangle}{%
593 {\mathclose}{symbols}{69}{largesymbols}{0B}}
594 \DeclareMathDelimiter{\langle}{%
595 {\mathopen}{symbols}{68}{largesymbols}{0A}}
596 \DeclareMathDelimiter{\rbrace}{%
597 {\mathclose}{symbols}{67}{largesymbols}{09}}
598 \DeclareMathDelimiter{\lbrace}{%
599 {\mathopen}{symbols}{66}{largesymbols}{08}}
600 \DeclareMathDelimiter{\rceil}{%
601 {\mathclose}{symbols}{65}{largesymbols}{07}}
602 \DeclareMathDelimiter{\lceil}{%
603 {\mathopen}{symbols}{64}{largesymbols}{06}}
604 \DeclareMathDelimiter{\rfloor}{%
605 {\mathclose}{symbols}{63}{largesymbols}{05}}
606 \DeclareMathDelimiter{\lfloor}{%
607 {\mathopen}{symbols}{62}{largesymbols}{04}}

```

\lgroup There are three plain TeX delimiters which are not fully supported by NFSS, since they partly point into a bold cmr font. Allocating a full symbol font, just to have three delimiters seems a bit too much given the limited space available. For this reason only the extensible sizes are supported. If this is not desired one can use, without losing portability, define \mathbf and \mathtt as font symbol alphabet (setting up cmr/bx/n and cmtt/m/n as symbol fonts first) and modify the delimiter declarations to point with their small variant to those symbol fonts. (This is done in `oldlfont.dtx` so look there for examples.)

```

608 \DeclareMathDelimiter{\lgroup} % extensible (with sharper tips
609 {\mathopen}{largesymbols}{3A}{largesymbols}{3A}
610 \DeclareMathDelimiter{\rgroup} % extensible) with sharper tips
611 {\mathclose}{largesymbols}{3B}{largesymbols}{3B}
612 \DeclareMathDelimiter{\bracevert} % the vertical bar that extends braces
613 {\mathord}{largesymbols}{3E}{largesymbols}{3E}
```

(End definition for \lgroup, \rgroup, and \bracevert.)

## 6.5 Math versions of text commands

The \mathunderscore here is really a text definition, so it has been put back into `ltoutenc.dtx` (by Chris, 30/04/97) and should be removed from here.

These symbols are the math versions of text commands such as \P, \\$, etc.

\mathparagraph These math symbols are not in plain TeX.

```

\mathsection 614 \DeclareMathSymbol{\mathparagraph}{\mathord}{symbols}{7B}
\mathdollar 615 \DeclareMathSymbol{\mathsection}{\mathord}{symbols}{78}
\mathsterling 616 \DeclareMathSymbol{\mathdollar}{\mathord}{operators}{24}
\mathunderscore 617 \ DeclareRobustCommand{\mathsterling}{\mathit{\mathchar"7024}}
618 \ DeclareRobustCommand{\mathunderscore}{\kern.06em\vbox{\hrule\@width.3em}}
```

(End definition for \mathparagraph and others.)

\mathellipsis This is plain TeX's \ldots.

```
619 \ DeclareRobustCommand{\mathellipsis}{\mathinner{\ldotp\ldotp\ldotp}}%
```

(End definition for \mathellipsis.)

## 6.6 Other special functions and parameters

### 6.6.1 Biggggg

```

620 </math>
621 <math | latexrelease>
622 <mathrelease>\IncludeInRelease{2018/12/01}%
623 <mathrelease> {\Big}{Start LR-mode}%
624 \DeclareRobustCommand{\big[1]{\leavevmode@ifvmode
625 {\hbox{$\left#1\vbox{to8.5\p@\right.\n@space$}}}}}
626 \DeclareRobustCommand{\Big[1]{\leavevmode@ifvmode
627 {\hbox{$\left#1\vbox{to11.5\p@\right.\n@space$}}}}}
628 \DeclareRobustCommand{\bigg[1]{\leavevmode@ifvmode
629 {\hbox{$\left#1\vbox{to14.5\p@\right.\n@space$}}}}}
630 \DeclareRobustCommand{\Bigg[1]{\leavevmode@ifvmode
631 {\hbox{$\left#1\vbox{to17.5\p@\right.\n@space$}}}}}
632 </math | latexrelease>
```

```

633 \end{macro}
634 \end{macro}
635 \end{macro}
636 \def\big#1{\hbox{$\left#1\vbox{to8.5\p@{}\right.\n@space$}$}}
637 \def\Big#1{\hbox{$\left#1\vbox{to11.5\p@{}\right.\n@space$}$}}
638 \def\bigg#1{\hbox{$\left#1\vbox{to14.5\p@{}\right.\n@space$}$}}
639 \def\Bigg#1{\hbox{$\left#1\vbox{to17.5\p@{}\right.\n@space$}$}}
640 \end{macro}
641 \end{macro}
642 \def\n@space{\nulldelimiterspace\z@\m@th}

```

### 6.6.2 The log-like functions

\operator@font The \operator@font determines the symbol font used for log-like functions.

```

643 \def\operator@font{\mathgroup\symoperators}

```

(End definition for \operator@font.)

### 6.6.3 Parameters

```

644 \thinmuskip=3mu
645 \medmuskip=4mu plus 2mu minus 4mu
646 \thickmuskip=5mu plus 5mu

```

This finishes the low-level setup in `fontmath.ltx`.

```

647 \end{macro}

```

## 7 Default cfg files

We provide default cfg files here to ensure that on installations that search large file trees we do not pick up some strange customisation files from somewhere.

```

648 <*cfgtext | cfgmath | cfgprel>
649 %%
650 %%
651 %%
652 %% Load the standard setup:
653 %%
654 <+cfgtext> \input{fonttext.ltx}
655 <+cfgmath> \input{fontmath.ltx}
656 <+cfgprel> \input{preload.ltx}
657 %%
658 %% Small changes could go here; see documentation in cfgguide.tex for
659 %% allowed modifications.
660 %%
661 %% In particular it is not allowed to misuse this configuration file
662 %% to modify internal LaTeX commands!
663 %%

673 ⟨/cfgtext | cfgmath | cfgprel⟩

# File C

## preload.dtx

### 1 Overview

This file contains a number of possible settings for preloading fonts during installation of NFSS2 (which is used by L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> ). It will be used to generate the following files:

|               |                                                                |
|---------------|----------------------------------------------------------------|
| preload.min   | minimal subset of fonts necessary to run NFSS2                 |
| preload.ori   | preload of CM fonts similar to the old <code>1fonts.tex</code> |
| preload.ltx   | The standard selection of preloads                             |
| cmpreload.xpt | preload of CM fonts for 10pt document size                     |
| cmpreload.xip | preload of CM fonts for 11pt document size                     |
| cmpreload.xii | preload of CM fonts for 12pt document size                     |
| dcpreload.xpt | preload of DC fonts for 10pt size                              |
| dcpreload.xip | preload of DC fonts for 11pt size                              |
| dcpreload.xii | preload of DC fonts for 12pt size                              |

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

### 2 Customization

You can customize the preloaded fonts in your L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by \*all\* L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by L<sup>A</sup>T<sub>E</sub>X 2.09.

If you normally use other fonts than Computer Modern `preload.min` might be best.

**Warning:** If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

### 3 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

|         |                                                         |
|---------|---------------------------------------------------------|
| driver  | produce a documentation driver file                     |
| preload | produce a preload... file                               |
| cm      | for OT1 encoded Computer Modern                         |
| dc      | for T1 encoded Computer Modern                          |
| min     | produce minimal subset                                  |
| xpt     | produce 10pt preloads                                   |
| xipt    | produce 11pt preloads                                   |
| xiipt   | produce 12pt preloads                                   |
| ori     | produce preloads similar to old <code>lfonts.tex</code> |
| tex     | produce preload.ltx                                     |

A typical DOCSTRIP command file would then have entries like:

```
generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

## 4 A driver for this document

The next bit of code contains the documentation driver file for  $\text{\TeX}$ , i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 {*driver}
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
5 \DocInput{preload.dtx}
6 \end{document}
7
```

## 5 The code

We begin by loading the math extension font (`cmex10`) and the  $\text{\LaTeX}$  line and circle fonts. It is necessary to do this explicitly since these are used by the  $\text{\LaTeX}$  format. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 {-tex}*****%
12 {-tex}% Start any modification below this point **
13 {-tex}*****%
14 {-tex}%
15 %%%
16 %% Computer Modern Roman:
17 %%-----
```

```

18 <*ori>

```

# File D

## ltfntcmd.dtx

### Abstract

The commands defined in this file `ltfntcmd` are part of the kernel code for L<sup>A</sup>T<sub>E</sub>X 2<sub>&</sub>/NFSS2.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

### 1 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the T<sub>E</sub>X system and for several reasons it is better to avoid them on the user level whenever possible. In L<sup>A</sup>T<sub>E</sub>X3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text...`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.<sup>30</sup> The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,.}
```

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only
```

---

<sup>30</sup>Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

| <i>Command</i>               | <i>Corresponds to</i>    | <i>Action</i>                                      |
|------------------------------|--------------------------|----------------------------------------------------|
| <code>\textnormal{..}</code> | <code>\normalfont</code> | Typeset argument in normal family                  |
| <code>\textrm{..}</code>     | <code>\rmfamily</code>   | Typeset argument in roman family                   |
| <code>\textsf{..}</code>     | <code>\sffamily</code>   | Typeset argument in <code>sans serif</code> family |
| <code>\texttt{..}</code>     | <code>\ttfamily</code>   | Typeset argument in <code>typewriter</code> family |
| <code>\textmd{..}</code>     | <code>\mdseries</code>   | Typeset argument in medium series                  |
| <code>\textbf{..}</code>     | <code>\bfseries</code>   | Typeset argument in <b>bold</b> series             |
| <code>\textup{..}</code>     | <code>\upshape</code>    | Typeset argument in normal shape                   |
| <code>\textit{..}</code>     | <code>\itshape</code>    | Typeset argument in <i>italic</i> shape            |
| <code>\textsl{..}</code>     | <code>\slshape</code>    | Typeset argument in <i>slanted</i> shape           |
| <code>\textsc{..}</code>     | <code>\scshape</code>    | Typeset argument in <code>SMALL CAPS</code> shape  |
| <code>\emph{..}</code>       | <code>\em</code>         | Typeset argument <i>emphasized</i>                 |

Table 1: Font-change commands with arguments

The font change commands provided here all start with `\text..` to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

`\emph{sometimes}` one has to help `\LaTeX{}` by adding a `\verb=\nocorr=` command.

which results in:

*When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L<sup>A</sup>T<sub>E</sub>X by adding a `\nocorr` command.*

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
{\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
 \texttt{itemize} environment and NFSS
 declarations.
\end{bfitemize}
```

This gives:

- This environment produces boldface items.
- It is defined in terms of L<sup>A</sup>T<sub>E</sub>X's `itemize` environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with `\!/`.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a `\V` in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of `\V` in `amstex.sty` is used as this version can cause space to be removed immediately before the `\V`.

## 2 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text..` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automagically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimizes this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```
1 {*2ekernel}
2 \def \DeclareTextFontCommand #1#2{%
3 \DeclareRobustCommand#1[1]{%
4 \ifmmode
5 \nfss@text{#2##1}%
6 \else
7 \hmode@bgroup
8 \text@command{##1}%
9 #2\check@icl ##1\check@icr
10 \expandafter
11 \egroup
12 \fi
13 }%
14 }
```

(End definition for `\DeclareTextFontCommand`.)

`\textrm` Now we define the `\text{<family>}` commands in terms of the above; `\textttt` does not look very nice!

`\textsf` 15 `\DeclareTextFontCommand{\textrm}{\rmfamily}`  
`\textnormal` 16 `\DeclareTextFontCommand{\textsf}{\sffamily}`  
17 `\DeclareTextFontCommand{\textttt}{\ttfamily}`  
18 `\DeclareTextFontCommand{\textnormal}{\normalfont}`

(End definition for `\textrm` and others.)

`\textbf` For the series attribute:

`\textmd` 19 `\DeclareTextFontCommand{\textbf}{\bfseries}`  
20 `\DeclareTextFontCommand{\textmd}{\mdseries}`

(End definition for `\textbf` and `\textmd`.)

`\textit` And for the shapes:

`\textsl` 21 `\DeclareTextFontCommand{\textit}{\itshape}`  
`\textsc` 22 `\DeclareTextFontCommand{\textsl}{\slshape}`  
`\textup` 23 `\DeclareTextFontCommand{\textsc}{\scshape}`  
24 `\DeclareTextFontCommand{\textup}{\upshape}`

(End definition for `\textit` and others.)

`textulc`  
`textsw` 25 `/2ekernel`  
`textssc` 26 `{*2ekernel | latexrelease}`  
27 `\langle latexrelease \rangle \IncludeInRelease{2020/02/02} %`

36 `\langle latexrelease \rangle`  
37 `\langle latexrelease \rangle \let\textulc\@undefined`  
38 `\langle latexrelease \rangle \let\textsw\@undefined`  
39 `\langle latexrelease \rangle \let\textssc\@undefined`  
40 `\langle latexrelease \rangle \EndIncludeInRelease`  
41 `{*2ekernel}`

(End definition for `textulc`, `textsw`, and `textssc`.)

`\emph` Finally we have the `\em` font change declaration of L<sup>A</sup>T<sub>E</sub>X. The corresponding definition with argument is

42 `\DeclareTextFontCommand{\emph}{\em}`

(End definition for `\emph`.)

`\nocorr` This is just a label, so it does nothing; it should also be unexpandable.

43 `\let\nocorr\relax`

(End definition for \nocorr.)

- \check@ic1 We define these defaults in case some error causes them to be expanded at the wrong time.  
\check@icr

```
44 \let \check@ic1 \@empty
45 \let \check@icr \@empty
```

(End definition for \check@ic1 and \check@icr.)

- \text@command This checks for a \nocorr as the first token in its argument and also for one in any other position not protected within braces (the latter is treated as if it were at the end of the argument).

Is this the correct action in the ‘empty’ case? It is efficient but typographically it is, strictly, incorrect!

```
46 \def \text@command #1{
47 \edef \reserved@a {\unexpanded{#1}}%
48 \ifx \reserved@a \@empty
49 \let \check@ic1 \@empty
50 \let \check@icr \@empty
51 \else
```

\space is a reserved word in L<sup>A</sup>T<sub>E</sub>X or actually already in plain T<sub>E</sub>X. If somebody really redefines it so many things will break that I don’t see any reason to make this routine here slower than necessary.

```
52 % \def \reserved@b { }%
53 % \ifx \reserved@a \reserved@b
54 \ifx \reserved@a \space
55 \let \check@ic1 \@empty
56 \let \check@icr \@empty
57 \else
58 \check@nocorr@ #1\nocorr@nil
59 \fi
60 \fi
61 }
62 \def \check@nocorr@ #1#2\nocorr#3@nil {%
```

The two checks are initialised here to their values in the normal case.

```
63 \let \check@ic1 \maybe@ic
64 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi} %
65 \def \reserved@a {\nocorr}%
66 \def \reserved@b {#1}%
67 \def \reserved@c {#3}%
68 \ifx \reserved@a \reserved@b
69 \ifx \reserved@c \@empty
```

In this case there is a \nocorr at the start but not at the end, so \check@ic1 should be empty.

```
70 \let \check@ic1 \@empty
71 \else
```

Otherwise there is a \nocorr both at the start and elsewhere, so no italic corrections should be added.

```
72 \let \check@ic1 \@empty
73 \let \check@icr \@empty
74 \fi
```

```

75 \else
76 \ifx \reserved@c \empty
```

In this case there is no `\nocorr` anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```

77 \else
```

In this case there is no `\nocorr` at the start but there is one elsewhere, so no `\aftergroup` is needed.

```

78 \let \check@icr \empty
79 \fi
80 \fi
81 }
```

*(End definition for `\text@command` and `\check@nocorr@`.)*

`\ifmaybe@ic` Switch used solely within `\maybe@ic` not interfering with other switches.

```

82 \newif\ifmaybe@ic
```

*(End definition for `\ifmaybe@ic`.)*

`\maybe@ic` These macros implement the italic correction.

```

\maybe@ic@ 83 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
84 \def \maybe@ic@ {%
```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```

85 \ifdim \fontdimen@ne\font>\z@
86 \else
87 \maybe@icttrue
```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```

88 \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
89 \nocorrlist
```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```

90 \do \t@st@ic
```

Frank thinks that the next bit is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```

91 \ifmaybe@ic \sw@slant \fi
92 \fi
93 }
```

*(End definition for `\maybe@ic` and `\maybe@ic@`.)*

`\t@st@ic` The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```

94 \def \t@st@ic {%
95 \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
96 \ifx\reserved@b\@let@token

```

If they are the same we record the fact and jump out of the loop.

```

97 \maybe@icfalse
98 \break@tfor
99 \fi
100 }

```

(End definition for `\t@st@ic`.)

`\sw@slant` The definition of the mysterious `\sw@slant` command is as follows.

```

101 \def \sw@slant {%

```

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `\~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```

102 \ifdim \lastskip=z@
103 \fix@penalty
104 \else
105 \skip@\lastskip
106 \unskip
107 \fix@penalty
108 \hskip \skip@
109 \fi
110 }

```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@\lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard L<sup>A</sup>T<sub>E</sub>X code?

```

111 \def \fix@penalty {%
112 \ifnum \lastpenalty=z@
113 \@@italiccorr
114 \else
115 \count@\lastpenalty
116 \unpenalty
117 \@@italiccorr

```

```

118 \penalty \count0
119 \fi
120 }

```

(End definition for `\sw@slant` and `\fix@penalty`.)

- `\nocorrlist` This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```

121 \def \nocorrlist {,.}

```

(End definition for `\nocorrlist`.)

- `\nfss@text` This command will by default behave like a L<sup>A</sup>T<sub>E</sub>X `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```

122 \ifx \nfss@text \undefined
123 \def \nfss@text {\leavevmode\hbox}
124 \fi

```

(End definition for `\nfss@text`.)

- `\DeclareOldFontCommand` This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{\font-change decls} {math-alphabet}`

Here `\fn` is the font-declaration command being defined, `\font-change decls` is the declaration it will expand to in text-mode, and `{math-alphabet}` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```

\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\DeclareOldFontCommand{\sf}{\normalfont\sfamily}{\mathrm{sf}}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathrm{tt}}

```

```

125 \def \DeclareOldFontCommand #1#2#3{%
126 \ DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
127 }

```

(End definition for `\DeclareOldFontCommand`.)

- `\@fontswitch` These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```

128 \def \@fontswitch #1#2{%
129 \ifmmode
130 \let \math@bgroup \relax
131 \def \math@egroup {\let \math@bgroup \math@bgroup
132 \let \math@egroup \math@egroup}%

```

We need to have a `\relax` in the following line in case the #2 is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
133 #2\relax
134 \else
135 #1%
136 \fi
137 }
138 \let \@@math@bgroup \math@bgroup
139 \let \@@math@egroup \math@egroup

(End definition for \fontswitch, \math@bgroup, and \math@egroup.)
```

These commands are available only in the preamble.

```
140 \onlypreamble \DeclareTextFontCommand
141 \onlypreamble \DeclareOldFontCommand
```

### 3 Initialization

`\normalsize` This is defined to produce an error.

```
142 \def\normalsize{%
143 \@latex@error {The font size command \protect\normalsize\space
144 is not defined:\MessageBreak
145 there is probably something wrong with
146 the class file}\@eha
147 }
148 ⟨/2ekernel⟩
```

(End definition for `\normalsize`.)

## File E

# lttextcomp.dtx

This file contains the implementation for accessing the glyphs provided by the TS1 encoding (Text Companion Encoding). This is now offered as part of the kernel and so the `textcomp` package which used to provide the definitions is now mainly needed for compatibility reasons (and doesn't do much any more).

```
1 {*2ekernel | latexrelease}
2 <latexrelease>\NewModuleRelease{2020/02/02}{lttextcomp}
3 <latexrelease> {Text Companion symbols}
```

`\oldstylenums` Preserve the old definition of `\oldstylenums` under a different name.

`\legacyoldstylenums` This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
4 \DeclareRobustCommand\legacyoldstylenums[1]{%
5 \begingroup
```

Provide spacing using the interword space of the current font.

```
6 \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard L<sup>A</sup>T<sub>E</sub>X fonts even though they only contain substitutions).

```
7 \usefont{OML}{\rmdefault}{\f@series}{it}%
8 \mathgroup\symletters #1%
9 \endgroup
10 }
```

And here is the improved one that adjusts depending on surroundings.

```
11 \DeclareRobustCommand\oldstylenums[1]{%
12 \begingroup
13 \ifmmode
14 \mathgroup\symletters #1%
15 \else
```

The `\CheckEncodingSubset` is discussed below.

```
16 \CheckEncodingSubset\use@text@encoding{TS1}\tc@oldstylesubst2{{#1}}%
17 \fi
18 \endgroup
19 }
```

The helper to select the substitution if needed.

```
20 \def\tc@oldstylesubst#1{%
21 \tc@errorwarn
22 {Oldstyle digits unavailable for
23 family \f@family.\MessageBreak
24 Default oldstyle digits used instead}\@eha
25 \bgroup
26 \expand@font@defaults
```

The substitution defaults are provided in the file `fonttext.ltx`.

```
27 \ifx\f@family\rmdef@ult
28 \fontfamily\rmsubstdefault
29 \else\ifx\f@family\sffamily\sfdef@ult
30 \fontfamily\sfsbstdefault
31 \else\ifx\f@family\ttdef@ult
32 \fontfamily\ttsbstdefault
33 \else
34 \fontfamily\textcompsubstdefault
35 \fi\fi\fi
36 \fontencoding{TS1}\selectfont#1%
37 \egroup
38 }
```

(End definition for `\oldstylenums` and `\legacyoldstylenums`.)

`\textcompsubstdefault` Here is the default for the “unknown” case:

```
39 \def\textcompsubstdefault{\rmsubstdefault}
```

(End definition for `\textcompsubstdefault`.)

`\DeclareEncodingSubset` The declaration takes 3 mandatory arguments: an *encoding* for which a subsetting is wanted (currently always TS1, and most likely forever), the *font family* for which we declare the subset and finally the *subset* number (between 0 (all of the encoding is supported) and 9 many glyphs are missing).

For TS1 the numbers have been chosen in a way that most fonts can be fairly correctly categorized, but the default settings are always conservative, that is they may claim that less glyphs are supported than there actually are.

As these days many font families are set up to end in -LF (lining figures), -OsF (oldstyle figures), etc. the declaration supports a shortcut: if the *font family* name ends in -\* then the star gets replaced by these common ending, e.g.,

```
\DeclareEncodingSubset{TS1}{Alegreya-*}{2}
```

is the same as writing

```
\DeclareEncodingSubset{TS1}{Alegreya-LF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-OsF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TLF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-T0sF}{2}
```

If only some are needed then one can define them individually but in many cases all four are wanted, hence the shortcut.

The coding of the declaration has no error checking as it is mostly for internal use.

```
40 \def\DeclareEncodingSubset#1#2{%
41 \DeclareEncodingSubset@aux{#1}#2*\DeclareEncodingSubset@aux
42 }
43 \def\DeclareEncodingSubset@aux#1#2*#3\DeclareEncodingSubset@aux#4{%
```

if #3 is empty then there was no star, otherwise we define all four variants.

```
44 \expandafter\ifx\expandafter X\detokenize{#3}X%
45 \@DeclareEncodingSubset{#1}{#2}{#4}%
46 \else
47 \@DeclareEncodingSubset{#1}{#2LF}{#4}%
48 \@DeclareEncodingSubset{#1}{#2TLF}{#4}%
49 \@DeclareEncodingSubset{#1}{#20sF}{#4}%
50 \@DeclareEncodingSubset{#1}{#2T0sF}{#4}%
51 \fi
52 }
```

The subset info is stored in a command with the name `\family:subset` so if that already exists we change otherwise declare a subset.

```
53 \def\@DeclareEncodingSubset#1#2#3{%
54 \@ifundefined{#1:#2}{%
55 {\@font@info{Setting #2 sub-encoding to #1/#3}}%
56 {\@font@info{Changing #2 sub-encoding to #1/#3}}%
57 \@namedef{#1:#2}{#3}}
```

Any reason to allow those in the middle of documents?

```
58 \@onlypreamble\DeclareEncodingSubset
59 \@onlypreamble\DeclareEncodingSubset@aux
60 \@onlypreamble\@DeclareEncodingSubset
```

(End definition for `\DeclareEncodingSubset`.)

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs #3#5, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```
61 \def\CheckEncodingSubset#1#2#3#4#5{%
62 \ifnum #4>%
63 \expandafter\ifx\csname #2:\f@family\endcsname\relax
64 \csname #2:?\endcsname
65 \else
66 \csname #2:\f@family\endcsname
67 \fi
68 \relax
69 \expandafter\@firstoftwo
70 \else
71 \expandafter\@secondoftwo
72 \fi
73 {#1{#2}}{#3}%
74 #5%
75 }
```

(End definition for \CheckEncodingSubset.)

To set up the glyphs for the subsets we need a number helpers.

- \tc@errorwarn To we produce errors, warnings, or only info in the transcripts if glyphs require substitutions? By default it is “info” only. With the `textcomp` package that can be changed.

```
76 \def\tc@errorwarn#1#2{\@latex@info{#1}}
```

(End definition for \tc@errorwarn.)

\tc@subst

```
77 \def\tc@subst#1{%
78 \tc@errorwarn
79 {Symbol \string#1 not provided by\MessageBreak
80 font family \f@family\space
81 in TS1 encoding.\MessageBreak Default family used instead}\@eha
82 \bgroup
83 \expand@font@defaults
84 \ifx\f@family\rmdef@ult
85 \fontfamily\rmsubstdefault
86 \else\ifx\f@family\sfdef@ult
87 \fontfamily\sfsubstdefault
88 \else\ifx\f@family\ttdef@ult
89 \fontfamily\ttsubstdefault
90 \else
91 \fontfamily{textcompsubstdefault}
92 \fi\fi\fi}
```

Whatever default was chosen, we claim now (locally hopefully) that it can handle all slots (even if not true) to avoid looping in certain situations, e.g., when something was set up incorrectly.

```
93 \namedef{TS1:\f@family}{0}%
94 \selectfont#1%
95 \egroup
96 }
```

(End definition for \tc@subst.)

- \tc@fake@euro \tc@fake@euro is an example of a “fake” definition to use in arg #3 of the command `\CheckEncodingSubset` when a symbol is not available in a certain font family. Here we produce a poor man’s Euro symbol by combining a “C” with a “=“.

```
97 \def\tc@fake@euro#1{%
98 \leavevmode
99 \font@info{Faking \noexpand#1 for font family
100 \f@family\MessageBreak in TS1 encoding}%
101 \valign{##\cr
102 \vfil\hbox to 0.07em{\dimen@\f@size\p@
103 \math@fontsfalse
104 \fontsize{.7\dimen@}\z@\selectfont=\hss}%
105 \vfil\cr%
106 \hbox{C}\crcr
107 }%
108 }
```

(End definition for \tc@fake@euro.)

\tc@check@symbol These are two abbreviations that we use below to check symbols and accents in TS1.  
\tc@check@accent Only there to save some space, e.g., we can then write

```
DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}
```

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurrency is not available.

```
109 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
```

Accents have been made an error in the textcomp package when not available. Now that we provide the functionality in the kernel we avoid the error by swapping in a T1 accent if the TS1 accent is not available.

```
110 \%def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
111 \def\tc@check@accent#1{\CheckEncodingSubset\UseTextAccent
112 \def\tc@swap@accent#1{\tc@swap@accent#1}}
113 \def\tc@swap@accent#1#2{\UseTextAccent{T1}#1}
```

(End definition for \tc@check@symbol and \tc@check@accent.)

## 1 Sub-encodings

Here are the default definitions for the TS1 symbols. First those that we assume are always available if a font implements TS1.

```
114 \DeclareTextSymbolDefault{\textdollar}{TS1}
115 \UndeclareTextCommand{\textdollar}{OT1} % don't use the OT1 def any longer
116 \DeclareTextSymbolDefault{\textsterling}{TS1}
117 \UndeclareTextCommand{\textsterling}{OT1} % don't use the OT1 def any longer
118 \DeclareTextSymbolDefault{\textperthousand}{TS1}
119 \UndeclareTextCommand{\textperthousand}{T1} % don't use the T1 def
```

Using \UndeclareTextCommand above is enough only if the encoding definition files are not reloaded afterwards. In the past that happened if `fontenc` was used in the document preamble (not any longer). So in some sense it is better to fully remove them from the encoding files, but for rollbacks it is easier to keep them in for now.

These are the standard itemize and footnote symbols originally taken from OMS and now from TS1:

```
120 \DeclareTextSymbolDefault{\textasteriskcentered}{TS1}
121 \DeclareTextSymbolDefault{\textbullet}{TS1}
122 \DeclareTextSymbolDefault{\textdaggerdbl}{TS1}
123 \DeclareTextSymbolDefault{\textdagger}{TS1}
124 \DeclareTextSymbolDefault{\textparagraph}{TS1}
125 \DeclareTextSymbolDefault{\textperiodcentered}{TS1}
126 \DeclareTextSymbolDefault{\textsection}{TS1}
```

And here are the other TS1 glyphs that are implemented by every font (or nearly every—a few are commented out and moved to sub-encoding 9, because they aren't around in some fonts).

```
127 %%\DeclareTextSymbolDefault{\textbardbl}{TS1} % subst in sub-enc 9 above
128 \DeclareTextSymbolDefault{\textbrokenbar}{TS1}
129 %%\DeclareTextSymbolDefault{\textcelsius}{TS1} % subst in sub-enc 9 above
130 \DeclareTextSymbolDefault{\textcent}{TS1}
```

```

131 \DeclareTextSymbolDefault{\textcopyright}{TS1}
132 \DeclareTextSymbolDefault{\textdegree}{TS1}
133 \DeclareTextSymbolDefault{\textdiv}{TS1}
134 \DeclareTextSymbolDefault{\textlnot}{TS1}
135 \DeclareTextSymbolDefault{\textonehalf}{TS1}
136 \DeclareTextSymbolDefault{\textonequarter}{TS1}
137 %%\DeclareTextSymbolDefault{\textonesuperior}{TS1} % subst in sub-enc 9 above
138 \DeclareTextSymbolDefault{\textordfeminine}{TS1}
139 \DeclareTextSymbolDefault{\textordmasculine}{TS1}
140 \DeclareTextSymbolDefault{\textpm}{TS1}
141 \DeclareTextSymbolDefault{\textquotesignle}{TS1}
142 \DeclareTextSymbolDefault{\textquotestraightbase}{TS1}
143 \DeclareTextSymbolDefault{\textquotestraightdblbase}{TS1}
144 \DeclareTextSymbolDefault{\textregistered}{TS1}
145 %%\DeclareTextSymbolDefault{\textthreequartersemdash}{TS1} % subst in sub-enc 9 above
146 \DeclareTextSymbolDefault{\textthreequarters}{TS1}
147 %%\DeclareTextSymbolDefault{\textthreesuperior}{TS1} % subst in sub-enc 9 above
148 \DeclareTextSymbolDefault{\texttimes}{TS1}
149 \DeclareTextSymbolDefault{\texttrademark}{TS1}
150 %%\DeclareTextSymbolDefault{\texttwelveudash}{TS1} % subst in sub-enc 9 above
151 %%\DeclareTextSymbolDefault{\texttwosuperior}{TS1} % subst in sub-enc 9 above
152 \DeclareTextSymbolDefault{\textyen}{TS1}
153 \DeclareTextSymbolDefault{\textcapitalcompwordmark}{TS1}
154 \DeclareTextSymbolDefault{\textascendercompwordmark}{TS1}

```

In the following sections the remaining default definitions are ordered by sub-encoding in which they are become **unavailable**, i.e., they are not provided in the sub-encoding with that number and all sub-encodings with higher numbers.

Thus the symbols that are available in sub-encoding  $x$  are the symbols above (always available) and the symbols listed as becoming unavailable in sub-encodings  $x + 1$  and higher.

## 1.1 Unavailable in sub-encoding 1 and higher (drop symbols not working in Latin Modern)

The `\textcircled` is available but the glyph is simply too small so we keep using the OMS glyph.

```

155 \DeclareTextCommandDefault{\textcircled}
156 {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OMS}}1\textcircled}

```

## 1.2 Unavailable in sub-encoding 2 (majority of new OTF fonts via autoinst) and higher

```

157 \DeclareTextCommandDefault{\t}
158 {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OML}}2\t}

```

Capital accents are really only very seldom implemented, so from sub-encoding 2 onwards we use the normal T1 accents if they are asked for in the document.

In Unicode engines we don't implement them at all but always use the basic accents instead. whether that works or not really depends on the font, something like `\"X` usually comes out wrong in Unicode engines.

```

159 \ifx\Umathcode\@undefined
160 \DeclareTextCommandDefault{\capitalacute}

```

```

161 {\tc@check@accent{'}}2\capitalacute}
162 \DeclareTextCommandDefault{\capitalbreve}
163 {\tc@check@accent{\u}2\capitalbreve}
164 \DeclareTextCommandDefault{\capitalcaron}
165 {\tc@check@accent{\v}2\capitalcaron}
166 \DeclareTextCommandDefault{\capitalcedilla}
167 {\tc@check@accent{\c}2\capitalcedilla}
168 \DeclareTextCommandDefault{\capitalcircumflex}
169 {\tc@check@accent{\^}2\capitalcircumflex}
170 \DeclareTextCommandDefault{\capitaldieresis}
171 {\tc@check@accent{\"}2\capitaldieresis}
172 \DeclareTextCommandDefault{\capitaldotaccent}
173 {\tc@check@accent{\.}2\capitaldotaccent}
174 \DeclareTextCommandDefault{\capitalgrave}
175 {\tc@check@accent{\`}2\capitalgrave}
176 \DeclareTextCommandDefault{\capitalhungarumlaut}
177 {\tc@check@accent{\H}2\capitalhungarumlaut}
178 \DeclareTextCommandDefault{\capitalmacron}
179 {\tc@check@accent{\=}{2\capitalmacron}}
180 \DeclareTextCommandDefault{\capitalogonek}
181 {\tc@check@accent{\k}2\capitalogonek}
182 \DeclareTextCommandDefault{\capitalring}
183 {\tc@check@accent{\r}2\capitalring}
184 \DeclareTextCommandDefault{\capitaltie}
185 {\tc@check@accent{\t}2\capitaltie}
186 \DeclareTextCommandDefault{\capitaltilde}
187 {\tc@check@accent{\~}2\capitaltilde}

```

For \newtie and \capitalnewtie this is actually wrong, they should pick up the accent from the substitution font (not done yet).

```

188 \DeclareTextCommandDefault{\newtie}
189 {\tc@check@accent{\t}2\newtie}
190 \DeclareTextCommandDefault{\capitalnewtie}
191 {\tc@check@accent{\t}2\capitalnewtie}

```

In Unicode engines we just execute the simple accents:

```

192 \else
193 \DeclareTextCommandDefault{\capitalacute{@tabacckludge'}}
```

~~\DeclareTextCommandDefault{\capitalbreve{\u}}~~
~~\DeclareTextCommandDefault{\capitalcaron{\v}}~~
~~\DeclareTextCommandDefault{\capitalcedilla{\c}}~~

304 \DeclareTextCommandDefault{\textsurd}
305 {\textsymbol{tc@check}{symbol2}{textsurd}}

```

The `\textpertenthousand` also belongs in this group but here we have a choice: in T1 there is a definition for `\textpertenthousand` making the symbol up from % and

`\char 24` (twice) but in many fonts that char doesn't exist and the slot is reused for random ligatures. So better not use it because often it is wrong. But pointing to TS1 is also not great as only a few fonts have it as a real symbol, so we get a substitution to CM or LM.

Alternatively we could just state that the symbol is unavailable in those fonts. For now I substitute.

```
306 \DeclareTextCommandDefault{\textpertenthousand}
307 {\tc@check@symbol2\textpertenthousand}
308 \UndeclareTextCommand{\textpertenthousand}{T1}
```

### 1.3 Unavailable in sub-encoding 3 and higher

Sub-encoding 2 is the one where we loose many symbols. In the higher-numbered sub-encodings we see only a few dropped additionally.

```
309 \DeclareTextCommandDefault{\textlangle}
310 {\tc@check@symbol3\textlangle}
311 \DeclareTextCommandDefault{\textrangle}
312 {\tc@check@symbol3\textrangle}
```

### 1.4 Unavailable in sub-encoding 4 and higher

```
313 \DeclareTextCommandDefault{\textcolonmonetary}
314 {\tc@check@symbol4\textcolonmonetary}
315 \DeclareTextCommandDefault{\textdong}
316 {\tc@check@symbol4\textdong}
317 \DeclareTextCommandDefault{\textdownarrow}
318 {\tc@check@symbol4\textdownarrow}
319 \DeclareTextCommandDefault{\textleftarrow}
320 {\tc@check@symbol4\textleftarrow}

322 {\tc@check@symbol4\textlira}
323 \DeclareTextCommandDefault{\textrightarrow}
324 {\tc@check@symbol4\textrightarrow}
325 \DeclareTextCommandDefault{\textuparrow}
326 {\tc@check@symbol4\textuparrow}
327 \DeclareTextCommandDefault{\textwon}
328 {\tc@check@symbol4\textwon}
```

### 1.5 Unavailable in sub-encoding 5 (most older PS fonts) and higher

Most older PS fonts (supported in TeX since the early nineties when virtual fonts became available) are sorted under this sub-encoding. But in reality, many of them don't have all glyphs that should be available in sub-encoding 5. Instead they show little squares, i.e., they produce “tofu” if you are unlucky.

But the coverage is so random that it is impossible to sort them properly and if we tried to ensure that they only typeset those glyphs that are really always available, we would have to put them all into sub-encoding 9; so putting them into 5 is really a compromise.

Modern fonts usually don't typeset a tofu character if a glyph is missing. They are therefore only classified as sub-encoding 5 if they really support its glyph set completely.

```
329 \DeclareTextCommandDefault{\textestimated}
330 {\tc@check@symbol5\textestimated}
```

```

331 \DeclareTextCommandDefault{\textnumero}
332 {\tc@check@symbol5\textnumero}

```

## 1.6 Unavailable in sub-encoding 6 and higher

```

333 \DeclareTextCommandDefault{\textflorin}
334 {\tc@check@symbol6\textflorin}
335 \DeclareTextCommandDefault{\textcurrency}
336 {\tc@check@symbol6\textcurrency}

```

## 1.7 Unavailable in sub-encoding 7 and higher

```

337 \DeclareTextCommandDefault{\textfractionsolidus}
338 {\tc@check@symbol7\textfractionsolidus}
339 \DeclareTextCommandDefault{\textohm}
340 {\tc@check@symbol7\textohm}

363 \DeclareTextCommandDefault{\texttwosuperior}
364 {\tc@check@symbol{9}\texttwosuperior}
365 \DeclareTextCommandDefault{\textbardbl}
366 {\tc@check@symbol{9}\textbardbl}

```

## 2 Unicode engine specials

If we are using a unicode engine we handle some glyphs differently, so this here are the definitions for the Unicode encoding (overwriting the defaults above).

```

367 \ifx \Umathcode\@undefined \else

```

This set should be taken from TS1 encoding even if it means you get it from the default font for that encoding.

```

368 \%DeclareTextSymbol{\textcopyleft}{TS1}{171}
369 \%DeclareTextSymbol{\textdblhyphen}{TS1}{45}
370 \%DeclareTextSymbol{\textdblhyphenchar}{TS1}{127}
371 \%DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
372 \%DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
373 \%DeclareTextSymbol{\textleaf}{TS1}{108}
374 \%DeclareTextSymbol{\texttwelveudash}{TS1}{21}
375 \%DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}

```

If oldstyle numerals are asked for we just use \oldstylenums.

```

376 \DeclareTextCommand{\textzerooldstyle} \UnicodeEncodingName{\oldstylenums{0}}
377 \DeclareTextCommand{\textoneoldstyle} \UnicodeEncodingName{\oldstylenums{1}}
378 \DeclareTextCommand{\texttwooldstyle} \UnicodeEncodingName{\oldstylenums{2}}
379 \DeclareTextCommand{\textthreeoldstyle} \UnicodeEncodingName{\oldstylenums{3}}
380 \DeclareTextCommand{\textfouroldstyle} \UnicodeEncodingName{\oldstylenums{4}}
381 \DeclareTextCommand{\textfiveoldstyle} \UnicodeEncodingName{\oldstylenums{5}}
382 \DeclareTextCommand{\textsixoldstyle} \UnicodeEncodingName{\oldstylenums{6}}
383 \DeclareTextCommand{\textsevenoldstyle} \UnicodeEncodingName{\oldstylenums{7}}
384 \DeclareTextCommand{\texteightoldstyle} \UnicodeEncodingName{\oldstylenums{8}}
385 \DeclareTextCommand{\textnineoldstyle} \UnicodeEncodingName{\oldstylenums{9}}

```

These have Unicode slots so this should be integrated into TU explicitly

```

386 \DeclareTextSymbol{\textpilcrow} \UnicodeEncodingName{"00B6}
387 \DeclareTextSymbol{\textborn} \UnicodeEncodingName{"002A}
388 \DeclareTextSymbol{\textdied} \UnicodeEncodingName{"2020}
389 \DeclareTextSymbol{\textlbrackdbl} \UnicodeEncodingName{"27E6}
390 \DeclareTextSymbol{\textrbrackdbl} \UnicodeEncodingName{"27E7}
391 \DeclareTextSymbol{\textguarani} \UnicodeEncodingName{"20B2}

```

We could make \textcentoldstyle and \textdollaroldstyle point to dollar and cent in the Unicode encoding

```

392 \%DeclareTextSymbol{\textcentoldstyle} \UnicodeEncodingName{"00A2}
393 \%DeclareTextSymbol{\textdollaroldstyle} \UnicodeEncodingName{"0024}

```

but I think it is better to pick them up from TS1 even if that usually means LMR fonts

```

394 \DeclareTextSymbol{\textdollaroldstyle}{TS1}{138}
395 \DeclareTextSymbol{\textcentoldstyle} {TS1}{139}
396 \fi % --- END of Unicode engines specials

```

### 3 Font family sub-encodings setup

We declare the subsets for a good number of fonts in the kernel ...

But first the default for anything that is not declared. We use 9 which is most likely much too conservative, but with the advantage that we aren't getting missing glyphs (or at least that this is very unlikely). For nearly all font in the TeX Live distribution of 2019 "correct" classifications are given below, so that this default is only used for new font families, and over time the right classifications can be added here too.

```

397 \DeclareEncodingSubset{TS1}{?}{9}

```

This first block contains the fonts that have been already supported by the `textcomp` package way back, i.e., the font families that have TeX support since the mid-nineties.

```

## 5 The `textcomp` package

```

810 〈*TS1sty〉
811 〈\providecommand\DeclareRelease[3]{}〉
812 〈\providecommand\DeclareCurrentRelease[2]{}〉
813
814 \DeclareRelease{}{2018-08-11}{textcomp-2018-08-11.sty}
815 \DeclareCurrentRelease{}{2020-02-02}
816
817 \ProvidesPackage{textcomp}
818 [2020/02/02 v2.0n Standard LaTeX package]

```

A precaution in case this is used without rebuilding the format.

```
819 \NeedsTeXFormat{LaTeX2e}[2020/02/02]
```

This is implemented by defining the default subset:

```

820 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
821 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
822 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{8}}
823 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{9}}

```

The default is set up in the kernel is “safe” these days for unknown fonts but LaTeX has definitions for most families so it seldom applies.

If a different default is used then one needs to check the results to ensure that there aren’t “missing glyphs”.

The next set of options define the warning level (default in the kernel is info only). Using the package options you can change this behavior.

```

824 \DeclareOption{error}
825 {\gdef\tc@errorwarn{\PackageError{textcomp}}}
826 \DeclareOption{warn}
827 {\gdef\tc@errorwarn#1#2{\PackageWarning{textcomp}{#1}}}
828 \DeclareOption{info}
829 {\gdef\tc@errorwarn#1#2{\PackageInfo{textcomp}{#1}}}
830 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2{}}

```

The “force” option basically changes the sub-encoding to that of the default (which, unless changes, is 9 these days), i.e., it no longer depends on the font in use. This is

mainly there because it might have been used in older documents, but not something that is recommended.

```

831 \DeclareOption{force}{%
832 \def\CheckEncodingSubset#1#2#3#4#5{%
833 \ifnum #4>%
834 \csname #2:\endcsname
835 \relax
836 \expandafter\@firstoftwo
837 \else
838 \expandafter\@secondoftwo
839 \fi
840 {#1{#2}}{#3}%
841 #5}%
842 }
843 \ExecuteOptions{info}
844 \ProcessOptions\relax

```

There is not much else to do nowadays, because everything is already set up in the L<sup>A</sup>T<sub>E</sub>X kernel.

```

845 \InputIfFileExists{textcomp.cfg}
846 {\PackageInfo{textcomp}{Local configuration file used}}{}%
847 </TS1sty>

```

## 5.1 The old textcomp package code

This section contains the old code for the textcomp package and its documentation. It is only used if we roll back prior to 2020. Thus all the rest is mainly for historians. Note that the old code categorized in the sub-encodings only into 6 classes not 10.

```

848 <*TS1oldsty>
849 \ProvidesPackage{textcomp}
850 [2018/08/11 v2.0j Standard LATEX package]

```

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

- #5 those TS1 symbols that are also in the ISO-Adobe character set; without `\textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non-T<sub>E</sub>X world provide only this subset.
- #4 = #5 + `\texteuro`. Most newer fonts provide this.
- #3 = #4 + `\textomega`. Can also be described as  $TS1 \cap (ISO-Adobe \cup MacRoman)$ . (Except for the missing "currency".)
- #2 = #3 + `\textestimated` + `\textcurrency`. Can also be described as  $TS1 \cap Adobe-Western-2$ . This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

**#1** = TS1 without `\textcircled` and `\t`. These two glyphs are often not implemented and if their kernel defaults are changed commands like `\copyright` unnecessarily fail.

**#0** = full TS1

And here a summary to go in the transcript file:

```

851 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
852 \space\space 5 = only ISO-Adobe without
853 \string\textcurrency\MessageBreak
854 \space\space 4 = 5 + \string\texteuro\MessageBreak

863 Family '?' is the default used for unknown fonts.\MessageBreak
864 See the documentation for details@\gobble}

```

`\DeclareEncodingSubset` An encoding subset to which a font family belongs is declared by the command `\DeclareEncodingSubset` that takes the major encoding as the first argument (e.g., TS1), the family name as the second argument (e.g., cmr), and the subset encoding id as a third, (e.g., 0 for cmr).

The default encoding subset to use when nothing is known about the current font family is named ?.

```

865 \def\DeclareEncodingSubset#1#2#3{%
866 \@ifundefined{#1:#2}{%
867 {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
868 {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
869 }{\@namedef{#1:#2}{#3}}%
870 }@\onlypreamble\DeclareEncodingSubset

```

(End definition for `\DeclareEncodingSubset`.)

The options for the package are the following:

**safe** for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

**euro** enables the "safe" symbols plus the `\texteuro` command. Most newer fonts provide this.

**full** enables all TS1 commands; useful only with fonts like EC or CM bright.

**almostfull** same as "full", except that `\textcircled` and `\t` are *not* redefined from their defaults to avoid that commands like `\copyright` suddenly no longer work.

**force** ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

\iftc@forced Switch used to implement the **force** option  
871 \newif\iftc@forced \tc@forcedfalse

(End definition for \iftc@forced.)

This is implemented by defining the default subset:

872 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}  
873 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}  
874 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}  
875 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}

The default is “almostfull” which means that old documents will work except that \textcircled and \t will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn’t implement these glyphs.

The “force” option simply sets the switch to true.

876 \DeclareOption{force}{\tc@forcedtrue}

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

877 \def\tc@errorwarn{\PackageError}  
878 \DeclareOption{warn}{\gdef\tc@errorwarn#1#2#3{\PackageWarning{#1}{#2}}}  
879 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2#3{}}  
880 \ExecuteOptions{almostfull}  
881 \ProcessOptions\relax

\CheckEncodingSubset The command \CheckEncodingSubset will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either \UseTextSymbol, \UseTextAccent depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of \CheckEncodingSubset.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute #1{#2}#5 otherwise it runs #3#5, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

882 \iftc@forced

If the “force” option was given we always use the default for testing against.

883 \def\CheckEncodingSubset#1#2#3#4#5{  
884 \ifnum #4>%  
885 \csname #2:\endcsname  
886 \relax  
887 \expandafter\@firstoftwo  
888 \else  
889 \expandafter\@secondoftwo  
890 \fi  
891 {#1{#2}}{#3}%  
892 #5%  
893 }

In normal circumstances the test is a bit more complicated: first check if there exists a macro `\langle arg2\rangle:\langle current-family\rangle` and if so use that value to test against, otherwise use the default to test against.

```

894 \else
895 \def\CheckEncodingSubset#1#2#3#4#5{%
896 \ifnum #4>%
897 \expandafter\ifx\csname #2:\f@family\endcsname\relax
898 \csname #2:?\endcsname
899 \else
900 \csname #2:\f@family\endcsname
901 \fi
902 \relax
903 \expandafter\@firstoftwo
904 \else
905 \expandafter\@secondoftwo
906 \fi
907 {#1{#2}}{#3}%
908 #5%
909 }
910 \fi

```

(End definition for `\CheckEncodingSubset`.)

`\tc@subst`

```

911 \def\tc@subst#1{%
912 \tc@errorwarn{textcomp}%
913 {Symbol \string#1 not provided by\MessageBreak
914 font family \f@family\space
915 in TS1 encoding.\MessageBreak Default family used instead}\@eha
916 \bgroup\fontfamily\textcompsubstdefault\selectfont#1\egroup
917 }

```

(End definition for `\tc@subst`.)

`\tc@error` `\tc@error` is going to be used in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

```

918 % error commands take argument:
919 % #1 symbol to be used
920 \def\tc@error#1{%
921 \PackageError{textcomp}%
922 {Accent \string#1 not provided by\MessageBreak
923 font family \f@family\space
924 in TS1 encoding}\@eha
925 }

```

(End definition for `\tc@error`.)

`\tc@fake@euro` `\tc@fake@euro` is an example of a “fake” definition to use in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a “C” with a “=“.

```

926 \def\tc@fake@euro#1{%
927 \leavevmode
928 \PackageInfo{textcomp}{Faking \noexpand#1 for font family}

```

```

929 \f@family\MessageBreak in TS1 encoding}%
930 \valign{\##\cr
931 \vfil\hbox to 0.07em{\dimen@\f@size\p@
932 \math@fontsfal se
933 \fontsize{.7\dimen@}\z@\selectfont=\hss}%
934 \vfil\cr%
935 \hbox{C}\crcr
936 }%
937 }

```

*(End definition for \tc@fake@euro.)*

\tc@check@symbol These are two abbreviations that we use below to check symbols and accents in TS1.  
\tc@check@accent Only there to save some space, e.g., we can then write

```
DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}
```

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurrency is not available.

```

938 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
939 \def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}

```

*(End definition for \tc@check@symbol and \tc@check@accent.)*

We start with the commands that are “safe” and which can be unconditionally set up, first the accents...

```

1120 {\tc@check@symbol2\textreferencemark}%
1121 \DeclareTextCommandDefault{\textsurd}{%
1122 {\tc@check@symbol2\textsurd}%

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1123 \DeclareTextCommandDefault{\textcircled}{%
1124 {\CheckEncodingSubset\UseTextAccent{TS1}}%
1125 {\UseTextAccent{OMS}}1\textcircled}%
1126 \DeclareTextCommandDefault{\t}{%
1127 {\CheckEncodingSubset\UseTextAccent{TS1}}%
1128 {\UseTextAccent{OML}}1\t}%

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimized for this encoding (and not for the default encoding).

```
1129 \input{ts1enc.def}
```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L<sup>A</sup>T<sub>E</sub>X which will prevent the usage of the TS1 versions. So we better get rid of them:

```

1130 \UndeclareTextCommand{\textsterling}{OT1}
1131 \UndeclareTextCommand{\textdollar} {OT1}

```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```

1132 %\UndeclareTextCommand{\textsterling}{OT4}
1133 %\UndeclareTextCommand{\textdollar} {OT4}

```

From the T1 encoding there are two candidates for removal: `%_o` and `%_oo` since these are both constructed from `%` followed by a tiny ‘`_`’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in `%_■` rather than `%_o` while the real glyph (at least for `\textperthousand`) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for `\textperthousand` but keeping the one for `\textpertenthousand`. This will have the effect that with Computer Modern fonts everything will come out (although `%_o` and `%_oo` are not taken from the same physical font) and with PostScript fonts `%_o` will come out correctly while `%_oo` will most likely look like `%_■` — which is probably an improvement over just getting a single ‘`■`’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ `\textpertenthousand`.

```

1134 \UndeclareTextCommand{\textperthousand}{T1}
1135 %\UndeclareTextCommand{\textpertenthousand}{T1}

```

### 5.1.1 Supporting oldstyle digits

```

1136 \DeclareRobustCommand\oldstylenums[1]{%
1137 \begingroup
1138 \ifmmode
1139 \mathgroup\symletters #1%
1140 \else
1141 \CheckEncodingSubset\use@text@encoding{TS1}%
1142 {\PackageWarning{textcomp}%

```

```

1143 {Oldstyle digits unavailable for
1144 family \f@family.\MessageBreak
1145 Lining digits used instead}}%
1146 \tw@{\#1}%
1147 \fi
1148 \endgroup
1149 }

```

### 5.1.2 Subset encoding defaults

For many font families commonly used in the TEX world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```

1150 \iftc@forced \else
 Computer modern based fonts (e.g., CM, CM-Bright, Concrete):
1151 \DeclareEncodingSubset{TS1}{cmr} {0}
1152 \DeclareEncodingSubset{TS1}{cmss} {0}
1153 \DeclareEncodingSubset{TS1}{cmtt} {0}
1154 \DeclareEncodingSubset{TS1}{cmvtt} {0}
1155 \DeclareEncodingSubset{TS1}{cmbr} {0}
1156 \DeclareEncodingSubset{TS1}{cmtl} {0}
1157 \DeclareEncodingSubset{TS1}{ccr} {0}

 PSNFSS fonts:
1158 \DeclareEncodingSubset{TS1}{ptm} {4}
1159 \DeclareEncodingSubset{TS1}{pcr} {4}
1160 \DeclareEncodingSubset{TS1}{phv} {4}
1161 \DeclareEncodingSubset{TS1}{ppl} {3}
1162 \DeclareEncodingSubset{TS1}{pag} {4}
1163 \DeclareEncodingSubset{TS1}{pbk} {4}
1164 \DeclareEncodingSubset{TS1}{pnc} {4}
1165 \DeclareEncodingSubset{TS1}{pzc} {4}
1166 \DeclareEncodingSubset{TS1}{bch} {4}
1167 \DeclareEncodingSubset{TS1}{put} {5}

 Other CTAN fonts (probably not complete):
1168 \DeclareEncodingSubset{TS1}{uag} {5}
1169 \DeclareEncodingSubset{TS1}{ugq} {5}
1170 \DeclareEncodingSubset{TS1}{u18} {4}
1171 \DeclareEncodingSubset{TS1}{u19} {4} % (LuxiSans, one day)
1172 \DeclareEncodingSubset{TS1}{augie} {5}
1173 \DeclareEncodingSubset{TS1}{dayrom} {3}
1174 \DeclareEncodingSubset{TS1}{dayroms} {3}
1175 \DeclareEncodingSubset{TS1}{pxr} {0}
1176 \DeclareEncodingSubset{TS1}{pxss} {0}
1177 \DeclareEncodingSubset{TS1}{pxtt} {0}
1178 \DeclareEncodingSubset{TS1}{txr} {0}
1179 \DeclareEncodingSubset{TS1}{txss} {0}
1180 \DeclareEncodingSubset{TS1}{txtt} {0}

 Latin Modern and TeX Gyre:
1181 \DeclareEncodingSubset{TS1}{lmr} {0}
1182 \DeclareEncodingSubset{TS1}{lmdh} {0}

```

```

1183 \DeclareEncodingSubset{TS1}{lmss} {0}
1184 \DeclareEncodingSubset{TS1}{lmssq} {0}
1185 \DeclareEncodingSubset{TS1}{lmvtt} {0}
1186 \DeclareEncodingSubset{TS1}{lmtt} {0}
1187 \DeclareEncodingSubset{TS1}{qhv} {0}
1188 \DeclareEncodingSubset{TS1}{qag} {0}
1189 \DeclareEncodingSubset{TS1}{qbk} {0}
1190 \DeclareEncodingSubset{TS1}{qcr} {0}
1191 \DeclareEncodingSubset{TS1}{qcs} {0}
1192 \DeclareEncodingSubset{TS1}{qpl} {0}
1193 \DeclareEncodingSubset{TS1}{qtm} {0}
1194 \DeclareEncodingSubset{TS1}{qzc} {0}
1195 \DeclareEncodingSubset{TS1}{qhvc} {0}

```

Fourier-GUTenberg:

```

1196 \DeclareEncodingSubset{TS1}{futs} {4}
1197 \DeclareEncodingSubset{TS1}{futx} {4}
1198 \DeclareEncodingSubset{TS1}{futj} {4}

```

Y&Y's Lucida Bright

```

1199 \DeclareEncodingSubset{TS1}{hlh} {3}
1200 \DeclareEncodingSubset{TS1}{hls} {3}
1201 \DeclareEncodingSubset{TS1}{hlst} {3}

```

The remaining settings for Lucida are conservative: the following fonts contain the `\textohm` character but not the `\texteuro`, i.e., belong to neither subset 4 nor subset 3. If you want to use the `\textohm` with these fonts copy these definition to `textcomp.cfg` and change the subset to 3. However in that case make sure that you do not use the `\texteuro`.

```

1202 \DeclareEncodingSubset{TS1}{hlct} {5}
1203 \DeclareEncodingSubset{TS1}{hlx} {5}
1204 \DeclareEncodingSubset{TS1}{hlce} {5}
1205 \DeclareEncodingSubset{TS1}{hlcn} {5}
1206 \DeclareEncodingSubset{TS1}{hlcw} {5}
1207 \DeclareEncodingSubset{TS1}{hlcf} {5}

```

Other commercial families...

```

1208 \DeclareEncodingSubset{TS1}{pplx} {3}
1209 \DeclareEncodingSubset{TS1}{pplj} {3}
1210 \DeclareEncodingSubset{TS1}{ptmx} {4}
1211 \DeclareEncodingSubset{TS1}{ptmj} {4}

```

If the file `textcomp.cfg` exists it will be loaded at this point. This allows to define further subset encodings for font families not covered by default.

```

1214 \fi
1215 </TS1oldsty>

```

# File F

## ltpageno.dtx

### 1 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering` The user sets the page number style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```
1 {*2ekernel}
2 \message{page nos.,}
3 \countdef\c@page=0 \c@page=1
4 \def\cl@page{}
5 \def\pagenumbering#1{%
6 \global\c@page \c@ne \gdef\thepage{\csname \#1\endcsname
7 \c@page}}
8 {/2ekernel}
```

# File G

## ltxref.dtx

### 1 Cross Referencing

The user writes `\label{<foo>}` to define the following cross-references:

`\ref*<{<foo>}`: value of most recently incremented referenceable counter. in the current environment. (Chapter, section, theorem, footnote and enumeration counters and other counters stepped with `\refstepcounter` are referenceable.)

`\pageref*<{<foo>}`: page number at which `\label{foo}` command appeared. where foo can be any string of characters not containing ‘\’, ‘{’ or ‘}’.

Note: The scope of the `\label` command is delimited by environments, so  
`\begin{theorem} \label{foo} ... \end{theorem} \label{bar}`  
defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

Note: the starred versions `\ref*` and `\pageref*` are provided to align with the use of `hyperref`. Without `hyperref` (or some other package using the starred form) the star is simply ignored.

#### 1.1 Cross Referencing

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```
1 <*2ekernel>
2 \message{x-ref,}
```

This is implemented as follows. A referenceable counter CNT is incremented by the command `\refstepcounter{CNT}`, which sets `\@currentlabel == {CNT}{eval(\p@cnt\theCNT)}`. The command `\label{FOO}` then writes the following on file `\@auxout` :

```
\newlabel{FOO}{{eval(\@currentlabel)}{eval(\thepage)}}
```

```
\ref{FOO} ==
BEGIN
 if \r@foo undefined
 then @refundefined := G T
 ??
 Warning: 'reference foo on page ... undefined'
 else \car \eval(\r@FOO)\@nil
fi
END

\pageref{foo} =
BEGIN
 if \r@foo undefined
 then @refundefined := G T
 ??
```

```

 Warning: 'reference foo on page ... undefined'
else \@cdr \eval(\@r@FOO)\@nil
fi
END

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

**\labelformat** A reference via `\ref` produces by default the data associated with the corresponding `\label` command (typically a number); any additional formatting has to be provided by the user. If, for example, references to equations are always to be typeset as “equation (*number*)”, one has to code “`equation (\ref{key})`”. With `\labelformat` there is a possibility to generate such frills automatically without resorting to low-level coding. The command takes two arguments: the first is the name of a counter and the second is its representation when referenced. This means that for a successful usage, one has to know the counter name being used for generating the label, though in practice this should not pose a problem. The current counter number is picked up as an argument. Here are two examples:

```

\labelformat{section}{section~#1}
\labelformat{equation}{equation~(#1)}

```

**\Ref** A side effect of using `\labelformat` is that, depending on the defined formatting, it becomes impossible to use `\ref` at the beginning of a sentence (if its replacement text starts with a lowercase letter). To overcome this problem we introduce the command `\Ref` that behave like `\ref` except that it uppercases the first token of the generated string.

To make `\Ref` work properly the very first token in the second argument of `\labelformat` has to be a simple ASCII or UTF-8 letter, otherwise the capitalization will fail or worse, you will end up with some error messages. If you actually need something more complicated in this place (e.g., an accented letter not written as a UTF-8 character) you have to explicitly surround it with braces, to identify the part that needs to be capitalized. For example, for figure references in the Hungarian language you might want to write `\labelformat{figure}{{'a}bra~\thefigure}` or use `\labelformat{figure}{\'abra~\thefigure}` which avoids the brace problem.

**\G@refundefinedtrue** This does not save on name-space (since `\G@refundefinedfalse` was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

**Note** despite its name, `\G@refundefinedtrue` does *not* correspond to an `\if` command, and there is no matching `...false`. It would be more natural to call the command `\G@refundefined` (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a `\ref`-like command that mimicked the definition of `\ref`, calling `\G@refundefinedtrue`. Inspection of the T<sub>E</sub>X archives revealed several such packages, and so this command has been named `...true` so that the definition of `\ref` need not be changed, and the packages will work without change.

```

3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7 \gdef\@refundefined{%
8 \@latex@warning@no@line{There were undefined references}}}
9 \let\@refundefined\relax

```

(End definition for \G@refundefinedtrue and \Orefundefined.)

```

52 \global\@namedef{#1@#2}{#3}}}
53 \def\newlabel{\@newl@bel r}
54 \onlypreamble\@newl@bel

```

(End definition for `\newlabel` and `\@newl@bel`.)

`\if@multiplelabels` This is redefined to produce a warning if at least one label is defined more than once. It is executed by the `\enddocument` command.

```
55 \let \multiplelabels \relax
```

(End definition for `\if@multiplelabels` and `\@multiplelabels`.)

`\label` The commands `\label` and `\refstepcounter` have been changed to allow `\protect`'ed commands to work properly. For example,

```
\def\thechapter{\protect\foo{\arabic{chapter}.\romannumeral{section}}}
```

will cause a `\label{bar}` command to define `\ref{bar}` to expand to something like `\foo{4.d}`. Change made 20 Jul 88.

```

56 \def\label#1{\@bsphack
57 \protected@write\auxout{%
58 {\string\newlabel{#1}{\@currentlabel}{\thepage}}}}%
59 \@esphack

```

(End definition for `\label`.)

```

60 </2ekernel>
61 <2ekernel | latexrelease>
62 <| latexrelease>\IncludeInRelease{2022/06/01}%
63 <| latexrelease> {\Ref}{Add starred version}%

```

`\refstepcounter` Step the counter and allow for labels to point to its current value.

```

64 \def\@currentcounter{}
65 \def\refstepcounter#1{\stepcounter{#1}%
66 \edef\@currentcounter{#1}%
67 \protected@edef\@currentlabel

```

By generating the second csname first the `\p@...` command can grab it as an argument which can be helpful for more complicated typesetting arrangements.

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the....` With the original kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the

braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

```
68 {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
69 }
```

*(End definition for `\refstepcounter`.)*

`\labelformat` A shortcut to set the `\p@...` macro for a counter. It will pick up the counter representation as an argument so that it can be specially formatted.

```
70 \def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}
```

*(End definition for `\labelformat`.)*

`\Ref` This macro expands the result of `\ref` and then uppercases the first token. Only useful if the label was generated via `\labelformat` and contains some lower case letter at its start. If the label starts with a complicated construct (e.g., an accented letter that is provided via a command, e.g., `\"a` instead of a UTF-8 character like ä) one has to surround everything that needs uppercasing in a brace group in the definition of `\labelformat`.<sup>31</sup>

```
71 \def\@kernel@Ref#1{\protected@edef\@kernel@ref{#1}%
72 \expandafter\MakeUppercase\@tempa}

## ltmiscen.dtx

### 1 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`, The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1 <*2ekernel>
2 \message{environments,}
```

#### 1.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@end` is defined to be the `\end` command of TeX82.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end TeX in the middle.

121 \reserved@a \else \c@tempswatrue \fi}

```

(End definition for \@testdef.)

Reading data from auxiliary files (like .toc normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by TeX during that process.

However, especially the .toc file might be read in L-R mode (in cases the \tableofcontents attempts to put, say a list of sub-sections as a paragraph. In that case the newlines after a line like

```
\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}
```

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using `\endlinechar=-1` but that has the danger that it drops some valid endlines that should be converted to spaces (for example when the user edited the TOC and then used `\nofiles` to preserve it).

So the approach taken instead is this:

- `\addcontentsline` adds the command `\protected@file@percent` to the end of the second argument of `\@writefile` that is written to the `.aux`. As the name indicates this is a protected macro so it doesn't change if it is written out.
- When the `.aux` is read back in at the end of the run, `\@writefile` is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change `\@writefile` slightly: basically it looks at the second argument and if the last token in there is `\protected@file@percent` then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued `\addtocontents`, or from some package that uses `\@writefile` for writing its own files) then the command behaves exactly as before.

`\protected@file@percent` Dummy cs to be replaced by a percent sign inside `\@writefile`. If it survives (when used incorrectly) it will expand to nothing in a typesetting context.

```
122 /2ekernel
123 {*2ekernel | latexrelease}
124 \ifx\@empty\@gobble
125 \else
126 \def\@protected@file@percent{\MaskLineEndings}
```

(End definition for `\protected@file@percent`.)

`\add@percent@to@temptokena` Helper function which is used to inspect a sequence of tokens (the second argument of `\@writefile` and if the last token is `\protected@file@percent` it will replace it by a harmless percent. The result is saved in `\@temptokena` for later use.

```
127 \catcode`^=9
128 \long\gdef\add@percent@to@temptokena
129 #1\protected@file@percent#2\add@percent@to@temptokena
```

When we call this macro in `\@writefile` we stick in `\@empty` at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The `\expandafter` then expands this extra token away again.

```
130 {\expandafter\ifx\expandafter X\detokenize{#2}X\expandafter\dont@add@percent@to@temptokena
131 \expandafter\do@add@percent@to@temptokena\fi{#1}}
132 \long\def\dont@add@percent@to@temptokena#1{
133 \@temptokena\expandafter{#1}}
```

`latexrelease` will read this code in high-speed mode in certain situations. During that it will only look for `\if` tests but not actually execute the `\catcode` change above. As a result it will drop anything after the `%` character in the definition. Therefore the `\fi` needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```
134 \begingroup
```

```

135 \catcode`\%=12
136 \catcode`\^A=14
137 \long\gdef\do@add@percent@to@temptokena#1{\@temptokena\expandafter{\#1%`^A

```

180 \@ignorefalse
181 \begingroup\@endpefalse\reserved@a}

```

Before the `\document` code is executed we have to first undo the `\endgroup` as there should be none for this environment to avoid that changes on top-level unnecessarily go to TeX's savestack, and we have to initialize all hooks in the hook system. So we need to test for this environment name. But once it has been found all this testing is no longer needed and so we redefine `\@execute@begin@hook` to simply use the hook.

```

182 \def\@execute@begin@hook #1{%
183 \expandafter\ifx\csname #1\endcsname\document

233 <latexrelease> \csname #1\endcsname}%
234 <latexrelease> \ignorespaces
235 <latexrelease> \begingroup\@endpefalse\reserved@a}

```

A version that doesn't start out with `\relax` when in typesetting mode would be the following, but since `\begin` issues a `\begingroup` it wouldn't help much with respect to allowing things like `\noalign` or `\multicolumn` inside.

```

236 \%edef\begin
237 % {\unexpanded{%
238 % \ifx\protect\@typeset@protect
239 % \expandafter\@gobble
240 % \fi
241 % \protect
242 % }%
243 % \expandafter\noexpand\csname begin \endcsname
244 % }
245 \%@\namedef{begin }#1{%
246 % \ifundefined{#1}%
247 % {\def\reserved@a{\@latex@error{Environment #1 undefined}\@eha}}%
248 % {\def\reserved@a{\def\@currenvir{#1}}%
249 % \edef\@currenvline{\on@line}%
250 % \csname #1\endcsname}%
251 % \ignorespaces
252 % \begingroup\@endpefalse\reserved@a}

```

`\end` While `\begin` was made robust simply by using `\DeclareRobustCommand` we need to be a bit more subtle with `\end` as there are packages out there that try to look into the top-level contents of `\end{foo}` (that is at the expansion of `\endfoo`) to see if it contains certain macros. This is done by hitting `\end{foo}` with three `\expandafters`, the first to get

```
\csname endfoo\endcsname \@checkend{foo}%
etc.
```

the second to expand the `\csname`, i.e., to get to

```
\endfoo \@checkend{foo}%
etc.
```

and the third to finally get to the top-level content of `\endfoo`, i.e.

```
<top-level content of \endfoo> \@checkend{foo}%
etc.
```

Therefore a robust replacement should produce the same results after three expansions (there first is obviously different).

Basically the definition of `\end` should either produce `\protect\end` (when not doing typesetting) or it should produce `\end` (without the `\protect`) when doing typesetting. Furthermore, it should (when in typesetting mode) show exactly the same result as `\end` (which is the original fragile definition of `\end`) when you expand either of them twice, i.e.,

```
\endfoo \@checkend{foo}%
etc.
```

That is achieved with the code below (which is worth studying carefully).

There is some trickery involved here: in particular we use `\romannumeral` to change a single expansion into three successive expansions in one go. That primitive expands until it has scanned a number (0 in this case, so it doesn't produce any output) and so it allows us to place arbitrary many `\expandafters` inside that are all going to be executed when `\romannumeral` is hit by a single `\expandafter`.

```
253 <latexrelease>\edef\end
254 <latexrelease> {\unexpanded{%
255 <latexrelease> \romannumeral
256 <latexrelease> \ifx\protect\@typeset\protect
257 <latexrelease> \expandafter %1
258 <latexrelease> \expandafter %2
259 <latexrelease> \expandafter %1
260 <latexrelease> \expandafter %3 expands the \csname inside \end<space>
261 <latexrelease> \expandafter %1
262 <latexrelease> \expandafter %2 expands \end<space>
263 <latexrelease> \expandafter %1 expands the \else
264 <latexrelease> \z@
265 <latexrelease> \else
266 <latexrelease> \expandafter\z@\expandafter\protect
267 <latexrelease> \fi
268 <latexrelease> }%
269 <latexrelease> \expandafter\noexpand\csname end \endcsname
270 <latexrelease> }
```

And here is the original definition of `\end` the way it was in L<sup>A</sup>T<sub>E</sub>X for several decades now hidden in `\end`.

```
271 <latexrelease>\@namedef{end }#1{%
272 <latexrelease> \csname end#1\endcsname\@checkend{#1}%
273 <latexrelease> \expandafter\endgroup\if@endpe\@doendpe\fi
274 <latexrelease> \if@ignore\@ignorefalse\ignorespaces\fi}
275 <latexrelease>\EndIncludeInRelease
```

An here the rollback in case that is ever needed.

```

## 1.2 Center, Flushright, Flushleft

```

319 \message{center,}

```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```

\center, \flushright and \flushleft set
\rightskip = 0pt or \@flushglue (as appropriate)
\leftskip = 0pt or \@flushglue (as appropriate)
\parindent = 0pt
\parfillskip = 0pt. (except \flushleft)
\\ == \par \vskip -\parskip
\\[LENGTH] == \\ \vskip LENGTH
* == \par \penalty 10000 \vskip -\parskip
*[LEN] == * \vskip LENGTH

```

They invoke the trivlist environment to handle vertical spacing before and after them.

\centering, \raggedright and \raggedleft are the declaration analogs of the above.

\raggedright has a more universal effect, however. It sets \rightskip := flushglue. Every environment, like the list environments, that set \rightskip to its 'normal' value set it to \rightskip

### 1.3 Verbatim

405 \message{verbatim,}

The verbatim environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode`'d to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes '...' as its argument, and sets it verbatim in `\ttfamily` font.

The `*-variants` of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

`\@xverbatim`

`\@sxverbatim` 408 \begingroup \catcode '|=0 \catcode '['= 1  
409 \catcode']=2 \catcode '\{|=12 \catcode '\}=12  
410 \catcode'\\"=12 \gdef\@xverbatim#1\end{verbatim}#[#1|end[verbatim]]  
411 \gdef\@sxverbatim#1\end{verbatim\*}#[#1|end[verbatim\*]]  
412 |endgroup

(End definition for `\@xverbatim` and `\@sxverbatim`.)

`\@verbatim` Real start of verbatim environment We use `\relax` to prevent `\item` scanning too far.

413 </2ekernel>  
414 <\*2ekernel | latexrelease>  
415 <latexrelease>\IncludeInRelease{2017-04-15}{\@verbatim}%  
416 <latexrelease> {Disable hyphenation in verbatim}%  
417 \def\@verbatim{\trivlist \item\relax  
418 \if@minipage\else\vskip\parskip\fi  
419 \leftskip\@totalleftmargin\rightskip\z@skip  
420 \parindent\z@\parfillskip\@flushglue\parskip\z@skip

Added `\@par` to clear possible `\parshape` definition from a surrounding list (the verbatim guru says). Switch language when in vertical mode.

421 \@par

Set `\language` here to suppress hyphenation. Done this way rather than setting `\hyphenchar` as that is a global setting.

422 \language\l@nohyphenation  
423 \tempswafalse  
424 \def\par{  
425 \if@tempswa

A `\leavevmode` added: needed if, for example, a blank verbatim line is the first thing in a list item (wow!).

```

426 \leavevmode \null \@@par\penalty\interlinepenalty
427 \else
428 \tempswattrue
429 \ifhmode\@@par\penalty\interlinepenalty\fi
430 \fi}%

```

To allow customization we hide the font used in a separate macro.

```

431 \let\do\@makeother \dospecials
432 \obeylines \verbatim@font \noligs

```

To avoid a breakpoint after the labels box, we remove the penalty put there by the list macros: another use of `\unpenalty!`

```

462 </2ekernel>
463 <*2ekernel | latexrelease>
464 <latexrelease>\IncludeInRelease{2018/12/01}%
465 <latexrelease> {\verbvisible}{Setup visible space for \verb}%

```

**\asciispace** The character in slot 32, in typewriter fonts (historically) a visible space but in other fonts a real space or something else

```

466 \DeclareRobustCommand\asciispace{\char 32 }

(End definition for \asciispace.)

```

**\verbvisible** This defines how to get a visible space in \verb\* and friends. In classic TeX this is just the slot 32, but in TU encoded fonts we switch fonts and take the character from cmtt.

```

467 \ifx\Umathcode\@undefined
468 \let\verbvisible\asciispace % PdfTeX version
469 \else
470 \DeclareRobustCommand\verbvisible
471 {\leavevmode{\usefont{OT1}{cmtt}{m}{n}\asciispace}} % xetex/luatex version
472 \fi

(End definition for \verbvisible.)

```

**\@setupverbvisible** In pdfTeX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In XeTeX or LuaTeX a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of \verbvisible and if it is \asciispace we assume that the char32 can be used (e.g., in pdfTeX). We then redefine \xobeysp so that after running \@vobeyspaces we get characters from slot 32 for each active space.

```

473 \def\@setupverbvisible{%
474 \ifx\verbvisible\asciispace
475 \let\xobeysp\asciispace
476 \else

```

Otherwise we measure the width of a character in the mon-spaced current font and place a \verbvisible into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing \verbvisible one could use, for example, the \textvisible of the current typewriter font.

```

477 \setbox\z@\hbox{x}%
478 \setbox\@verbvisiblebox\hbox to\wd\z@{\hss\verbvisible\hss}%
479 \def\xobeysp{\leavevmode\copy\@verbvisiblebox}%
480 \fi
481 }

(End definition for \@setupverbvisible.)

```

**\@verbvisiblebox** The box to hold the visible space character if it isn't in slot 32 in the current typewriter font.

```

482 \newbox\@verbvisiblebox

(End definition for \@verbvisiblebox.)

```

**verbatim\*** (*env.*) For **verbatim\*** we also set up the correct visible space character definition and then run **\@vobeyspaces**. As this code is not called as part of the normal verbatim environment (the method is done the other way around this time) we don't have to check if space is already active—it shouldn't be.

```

# File I

## ltmath.dtx

### 1 Math setup

This file contains a lot of the original plain T<sub>E</sub>X code, as well as the L<sup>A</sup>T<sub>E</sub>X environments for math. It still needs sorting out.

```
1 <*2ekernel>
2 \message{math definitions,}
```

#### 1.1 Math commands based on plain T<sub>E</sub>X

##### 1.1.1 The log-like functions

\log The standard operators:

```
3 \DeclareRobustCommand\log{\mathop{\operator@font log}\nolimits}
4 \DeclareRobustCommand\lg{\mathop{\operator@font lg}\nolimits}
5 \DeclareRobustCommand\ln{\mathop{\operator@font ln}\nolimits}
6 \DeclareRobustCommand\lim{\mathop{\operator@font lim}\nolimits}
7 \DeclareRobustCommand\limsup{\mathop{\operator@font lim\,,sup}\nolimits}
8 \DeclareRobustCommand\liminf{\mathop{\operator@font lim\,,inf}\nolimits}
9 \DeclareRobustCommand\sin{\mathop{\operator@font sin}\nolimits}
10 \DeclareRobustCommand\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \DeclareRobustCommand\sinh{\mathop{\operator@font sinh}\nolimits}
12 \DeclareRobustCommand\cos{\mathop{\operator@font cos}\nolimits}
13 \DeclareRobustCommand\arccos{\mathop{\operator@font arccos}\nolimits}
14 \DeclareRobustCommand\cosh{\mathop{\operator@font cosh}\nolimits}
15 \DeclareRobustCommand\tan{\mathop{\operator@font tan}\nolimits}
16 \DeclareRobustCommand\arctan{\mathop{\operator@font arctan}\nolimits}
17 \DeclareRobustCommand\tanh{\mathop{\operator@font tanh}\nolimits}
18 \DeclareRobustCommand\cot{\mathop{\operator@font cot}\nolimits}
19 \DeclareRobustCommand\coth{\mathop{\operator@font coth}\nolimits}
20 \DeclareRobustCommand\sec{\mathop{\operator@font sec}\nolimits}
21 \DeclareRobustCommand\csc{\mathop{\operator@font csc}\nolimits}
22 \DeclareRobustCommand\max{\mathop{\operator@font max}\nolimits}
23 \DeclareRobustCommand\min{\mathop{\operator@font min}\nolimits}
24 \DeclareRobustCommand\sup{\mathop{\operator@font sup}\nolimits}
25 \DeclareRobustCommand\inf{\mathop{\operator@font inf}\nolimits}
26 \DeclareRobustCommand\arg{\mathop{\operator@font arg}\nolimits}
27 \DeclareRobustCommand\ker{\mathop{\operator@font ker}\nolimits}
28 \DeclareRobustCommand\dim{\mathop{\operator@font dim}\nolimits}
29 \DeclareRobustCommand\hom{\mathop{\operator@font hom}\nolimits}
30 \DeclareRobustCommand\det{\mathop{\operator@font det}\nolimits}
31 \DeclareRobustCommand\exp{\mathop{\operator@font exp}\nolimits}
32 \DeclareRobustCommand\Pr{\mathop{\operator@font Pr}\nolimits}
33 \DeclareRobustCommand\gcd{\mathop{\operator@font gcd}\nolimits}
34 \DeclareRobustCommand\deg{\mathop{\operator@font deg}\nolimits}
```

(End definition for \log.)

\bmod And some operators have to be done by hand:

```

35 \DeclareRobustCommand\bmod{%
36 \nonscript\mskip-\medmuskip\mkern5mu%
37 \mathbin{\operator@font mod}\penalty900\mkern5mu%
38 \nonscript\mskip-\medmuskip}

```

(End definition for `\bmod`.)

`\pmod`

```

39 \DeclareRobustCommand\pmod[1]{%
40 \allowbreak\mkern18mu(\operator@font mod}\,,\,#1)}

```

(End definition for `\pmod`.)

### 1.1.2 Biggggg

`\big` Variants on `\big` and friends for use with delimiters:

```

41 \DeclareRobustCommand\bigl{\mathopen\big}
42 \DeclareRobustCommand\bigm{\mathrel\big}
43 \DeclareRobustCommand\bigr{\mathclose\big}
44 \DeclareRobustCommand\Bigl{\mathopen\Big}
45 \DeclareRobustCommand\Bigm{\mathrel\Big}
46 \DeclareRobustCommand\Bigr{\mathclose\Big}
47 \DeclareRobustCommand\biggl{\mathopen\bigg}
48 \DeclareRobustCommand\biggm{\mathrel\bigg}
49 \DeclareRobustCommand\biggr{\mathclose\bigg}
50 \DeclareRobustCommand\Biggl{\mathopen\Bigg}
51 \DeclareRobustCommand\Biggm{\mathrel\Bigg}
52 \DeclareRobustCommand\Biggr{\mathclose\Bigg}

```

(End definition for `\big`.)

### 1.1.3 The UNSORTED Rest

The other math commands are lifted from plain TeX.

`\jot`

```

53 \newdimen\jot
54 \jot=3pt

```

(End definition for `\jot`.)

`\interdisplaylinepenalty`

```

55 \newcount\interdisplaylinepenalty
56 \interdisplaylinepenalty=100

```

(End definition for `\interdisplaylinepenalty`.)

`\choose`

```

57 \def\choose{\atopwithdelims()}

```

(End definition for `\choose`.)

`\brack`

```

58 \def\brack{\atopwithdelims[]}

```

(End definition for `\brack`.)

```

\brace
59 \def\brace{\atopwithdelims\{\}}
(End definition for \brace.)

\mathpalette
60 \def\mathpalette#1#2{%
61 \mathchoice
62 {#1\displaystyle{#2}}%
63 {#1\textstyle{#2}}%
64 {#1\scriptstyle{#2}}%
65 {#1\scriptscriptstyle{#2}}}
(End definition for \mathpalette.)

\root
\rootbox
66 \newbox\rootbox
\root@t
67 \def\root#1{\of{%
68 \setbox\rootbox\hbox{$\m@th\scriptscriptstyle{#1}$}%
69 \mathpalette\root@t}}
\def\root@t#1#2{%

`\lefteqn` `\lefteqn{FORMULA}` typesets `FORMULA` in display math style flushleft in a box of width zero.

```

415 \def\lefteqn#1{\rlap{$\displaystyle #1$}}

```

(End definition for `\lefteqn`.)

`\ensuremath` In math mode, `\ensuremath{text}` is equivalent to `text`; in LR or paragraph mode, it is equivalent to `$text$`. `\relax` is not needed in front of the `\ifmmode` as `\protect` will be `\let` to `\relax`. This version (due to Donald Arseneau) avoids duplicating its argument in the ‘then’ and ‘else’ part of the `\ifmath` which is necessary in nested ‘tabular’ like environments. See amslatex/2104.

```

416 \DeclareRobustCommand{\ensuremath}{%
417 \ifmmode
418 \expandafter\@firstofone
419 \else
420 \expandafter\@ensuredmath
421 \fi}

```

(End definition for `\ensuremath`.)

`\@ensuredmath` The `\relax` stops `\ensuremath{}` starting display math.

422 `\long\def\@ensuredmath#1{$\relax#1$}`

(End definition for `\@ensuredmath`.)

LuaTeX contains new math primitives to place expression over or under horizontally extensible glyphs. Before LuaTeX 1.14 these did not work correctly with the `\mathstyle` primitive and sometimes did not use cramped style in consistent ways. For newer version, we opt into the corrected behavior.

423 `\ifx\mathdefaultsmode\@undefined\else`

424   `\mathdefaultsmode=1`

425   `\fi`

426 `⟨/2ekernel⟩`

## 1.3 External options to the standard document classes

### 1.3.1 Left equation numbering

`\@eqnnum` To put the equation number on the left side of an equation we have to use a little trick. The number is shifted `\displaywidth` to the left inside a box of (approximately) zero width. This fails when the equation is too wide, the equation number than may overprint the equation itself.

427 `(*leqno)`

428 `\renewcommand\@eqnnum{\hb@xt@.01\p@{}}`%

429       `\rlap{\normalfont\normalcolor`

430       `\hskip -\displaywidth(\theequation)}`}%

431 `⟨/leqno⟩`

(End definition for `\@eqnnum`.)

### 1.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s displayed math environments.

`\mathindent` The amount of indentation of the equations is stored in a register.

432 `(*fleqn)`

433 `\newskip\mathindent`

The setting of `\mathindent` has to be deferred until the class file has been processed, because `\leftmargini` is still 0pt wide at the moment `fleqn.clo` is read in.

434 `\AtEndOfClass{\mathindent\leftmargini}`

(End definition for `\mathindent`.)

## ltlists.dtx

### 1 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{\LABEL}{{COMMANDS}} ... \endlist
```

which can be invoked by the user as the list environment. The *LABEL* argument specifies item labeling. *COMMANDS* contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by *ITEMLABEL*. If the argument is missing, then the *LABEL* argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{\ITEMLABEL}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{\ARG} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s *COMMANDS* argument.

A `\usecounter{\foo}` command in the second argument causes the counter *foo* to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place—i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{\relax}`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a trivlist environment must have an argument—in many cases, this will be the null argument (`\item[]`). The trivlist environment is mainly used for paragraphing environments, like verbatim, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

## 1.1 List and Trivlist

The following variables are used inside a list environment:

`\@totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\@listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\@mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\@inlabel` A switch that is false except between the time an `\item` is encountered and the time that TeX actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `\@inlabel = true`, it holds the labels to be put out by `\everypar`.

`\@noparitem` A switch set by `\list` when `\@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`\@noparlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`\@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`\@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\item` commands.

`\@nmbrrlist` Set true by `\usecounter` command, causes list to be numbered.

`\@listctr` \def'ed by `\usecounter` to name of counter.

`\@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like tabbing should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list`'s COMMANDS argument. These parameters are all TeX skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual TeX or L<sup>A</sup>T<sub>E</sub>X commands can be used to set them. The commands will be executed in vmode if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

## 1.2 Vertical Spacing (skips)

\topsep: Space between first item and preceding paragraph.

\partopsep: Extra space added to \topsep when environment starts a new paragraph (is called in vmode).

\itemsep: Space between successive items.

\parsep: Space between paragraphs within an item – the \parskip for this environment.

## 1.3 Penalties

\@beginparpenalty: put at the beginning of a list

\@endparpenalty: put at end of list

\@itempenalty: put between items.

## 1.4 Horizontal Spacing (dimens)

\leftmargin: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

\rightmargin: analogous.

\listparindent: extra indentation at beginning of every paragraph of a list except the one started by the \item command. May be negative! Usually, labeled lists have \listparindent equal to zero.

\itemindent: extra indentation added right BEFORE an item label.

\labelwidth: nominal width of box that contains the label. If the natural width of the label <= \labelwidth, then the label is flushed right inside a box of width \labelwidth (with an \hfil). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

\labelsep: space between end of label box and text of first item.

## 1.5 Default Values

Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to 0pt. Then, one of the commands \@listi, \@listii, ..., \@listvi is called, depending upon the current level of the list. The \@list ... commands should be defined by the document style. A convention that the document style should follow is to set \leftmargin to \leftmargini, ..., \leftmarginvi for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset. *Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more)*:

`\@endparenv` To suppress the paragraph indentation in text immediately following a paragraph-making environment, `\everypar` is changed to remove the space, and `\par` is redefined to restore `\everypar`. Instead of redefining `\par` and `\everypar`, `\@endparenv` was changed to set the `@endpe` switch, letting `\end` redefine `\par` and `\everypar`.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a `kern` to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in `raggedright` setting. If `\noindent` was used after `\item` want to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `\nobreak` when it is true is now essential since now it is sometimes set locally.

## 1.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```

\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumii}
\def\labelenumii{(\theenumii)}

```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `•`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@listspacing` and `\@listdepth`.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```

\enumerate ==
BEGIN

## ltboxes.dtx

### 1 L<sup>A</sup>T<sub>E</sub>X Box commands

\makebox \makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}  
Puts ⟨obj⟩ in an \hbox of width ⟨wid⟩, positioned by ⟨pos⟩.  
The possible ⟨pos⟩ are:  
**s** stretched,  
**l** flushleft,  
**r** flushright,  
**c** (default) centred.  
If ⟨wid⟩ is missing, then ⟨pos⟩ is also missing and ⟨obj⟩ is put in an \hbox of its natural width.  
\makebox(⟨x⟩,⟨y⟩)[⟨pos⟩]{⟨obj⟩}  
Puts ⟨obj⟩ in an \hbox of width  $x * \unitlength$  and height  $y * \unitlength$ .  
⟨pos⟩ arguments are **s**, **l**, **r** or **c** (default) for stretched, flushleft, flushright or centred, and **t** or **b** for top, bottom – or combinations like **tr** or **rb**. Default for horizontal and vertical are centered. Note that in this picture mode version of \makebox a [b] aligns on the *bottom* of the text as documented. If you want to align on the *baseline* use \makebox( , )[b]{\raisebox{0pt}[\height][0pt]{xyz}} or \makebox( , )[b]{\smash{xyz}}  
\mbox \mbox{⟨obj⟩} The same as \makebox{⟨obj⟩}, but is more efficient as no checking for optional arguments is done.  
\newsavebox \newsavebox{⟨cmd⟩} : If \cmd is undefined, then defines it to be a T<sub>E</sub>X box register.  
\savebox \savebox{⟨cmd⟩} ... : \cmd is defined to be a T<sub>E</sub>X box register, and the '...' are any \makebox arguments. It is like \makebox, except it doesn't produce text but saves the value in \box \cmd.  
\sbox \sbox{⟨cmd⟩}{⟨obj⟩} is an efficient abbreviation for  
\savebox{⟨cmd⟩}{⟨obj⟩}.  
\lrbox (env.) \begin{lrbox}{⟨cmd⟩}{⟨text⟩}\end{lrbox} is equivalent to  
\sbox{⟨cmd⟩}{⟨text⟩}  
except that any white space at the beginning and end of ⟨text⟩ is ignored.  
\framebox \framebox ... : like \makebox, except it puts a 'frame' around the box. The frame is made of lines of thickness \fboxrule, separated by space \fboxsep from the text – except for \framebox(X,Y) ... , where the thickness of the lines is as for the picture environment, and there is no separation added.  
\fbox \fbox{⟨obj⟩} is an abbreviation for \framebox{⟨obj⟩}.  
\parbox \parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩} : Makes a box with \hsize ⟨width⟩, positioned by ⟨pos⟩ as follows: c : \vcenter (placed in \$...\$ if not in math mode) b : \vbox t : \vtop default value is c. Sets \hsize := ⟨width⟩ and calls \parboxrestore, which does the following: Restores the original definitions of:  
\par  
\  
\-  
\'  
\`  
\=

Resets the following parameters:

|                   |   |                     |
|-------------------|---|---------------------|
| \parindent        | = | opt                 |
| \parskip          | = | opt                 |
| \ linewidth       | = | \hsize              |
| \@totalleftmargin | = | opt                 |
| \leftskip         | = | opt                 |
| \rightskip        | = | opt                 |
| \@rightskip       | = | opt                 |
| \parfillskip      | = | opt plus 1fil       |
| \lineskip         | = | \normallineskip     |
| \baselineskip     | = | \normalbaselineskip |

Calls \sloppy  
Note: \arrayparboxrestore same as \parboxrestore but it doesn't restore \\.

**minipage (env.)**      minipage : Similar to \parbox, except it also makes this look like a page by setting \textwidth == \columnwidth == box width  
changes footnotes by redefining:  
\@mpfn == mpfootnote  
\thempfn == \thempfootnote  
\@footnotetext == \@mpfootnotetext  
resets the following list environment parameters:  
\@listdepth == \@mplistdepth  
where \@mplistdepth is initialized to zero,  
and executes \minipagerestore to allow the document style to reset any other parameters it desires. It sets @minipage true, and resets \everypar to set it false. This switch keeps \addvspace from putting space at the top of a minipage.  
Change added 24 May 89: \minipage sets @minipage globally; \endminipage resets it false.

|            |                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \rule      | \rule[<raised>]{<width>}{<height>} : Makes a <width>*<height> rule, raised <raised>.                                                                                                                                                                                                                                                                              |
| \underline | \underline{<text>} : Makes an underlined hbox with <text> in it.                                                                                                                                                                                                                                                                                                  |
| \raisebox  | \raisebox{<distance>}{<height>}[<depth>]{<box>} :<br>Raises <box> up by <distance> length (down if <distance> negative). Makes T <sub>E</sub> X think that the new box extends <height> above the line and <depth> below, for a total vertical length of <height>+<depth>. Default values of <height> & <depth> = actual height and depth of box in new position. |

`\@arrayparboxrestore` Restore various paragraph parameters.

The rational for allowing two normally global flags to be set locally here was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\setnobreak`; otherwise this command will be redundant.

```

(End definition for `\@iirsbox`.)

`\@finalstrut` This macro adds a special strut the *depth* of the box given as #1, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect `\prevdepth` to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns.

The `\nobreak` was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

```
487 \def\@finalstrut#1{%
488 \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}
```

(End definition for `\@finalstrut`.)

## 1.1 Some low-level constructs

The following commands are basically inherited from plain TeX.

`\leftline` These macros place text on a full line either centred or left or right adjusted.  
`\rightline` 489 `\def\@cline{\hb@xt@\hsize}`  
`\centerline` 490 `\DeclareRobustCommand\leftline[1]{\@cline{\#1\hss}}`  
  `\@cline` 491 `\DeclareRobustCommand\rightline[1]{\@cline{\hss\#1}}`  
  `\centerline` 492 `\DeclareRobustCommand\centerline[1]{\@cline{\hss\#1\hss}}`

(End definition for `\leftline` and others.)

`\rlap` These macros place text to the left or right of the current reference point without taking up space.  
`\llap`

```
493 \DeclareRobustCommand\rlap[1]{\hb@xt@\z@{\#1\hss}}
494 \DeclareRobustCommand\llap[1]{\hb@xt@\z@{\hss\#1}}
```

And here is the version that centers, it was initially introduced by `mathtools`.

```
495 \DeclareRobustCommand\clap[1]{\hb@xt@\z@{\hss\#1\hss}}
```

(End definition for `\rlap`, `\llap`, and `\clap`.)

```
496 </2ekernel>
```

# File L

## lttab.dtx

### 1 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L<sup>A</sup>T<sub>E</sub>X 2.09 version, not the extended version described in *The L<sup>A</sup>T<sub>E</sub>X Companion*. Use the `array` package to obtain the extended version.

#### 1.1 tabbing

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```
\dimen(\@firsttab + i) = distance of tab stop i from left margin
 0 <= i <= 15 (?).

\dimen\@firsttab is initialized to \totallmargin, so it starts
 at the prevailing left margin.

\@maxtab = number of highest defined tab register
 probably = \@firsttab + 12
\@nxttabmar = tab stop number of next line's left margin
\@curtabmar = tab stop number of current line's left margin
\@curtab = number of the current tab. At start of line,
 it equals \@curtabmar
\@hightab = largest tab number currently defined.
\@tabpush = depth of \pushtab's

\box\@curline = contents of current line, excluding left margin
 skip, and excluding contents of current field
\box\@curfield = contents of current field

@rjfield = switch: T iff the last field of the line should
 be right-justified at the right margin.

\tabbingsep = distance left by the \` command between the
 current position and the field that is
 “left-shifted”.

UTILITY MACROS
\@stopfield : closes the current field
\@addfield : adds the current field to the current line.
\@contfield : continues the current field
\@startfield: begins the next field
\@stopline : closes the current line and outputs it
```

```

\@startline : starts the next line
\@ifatmargin : an \if that is true iff the current line.

## 1.2 array and tabular environments

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

ARRAY PARAMETERS:

|                 |                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \arraycolsep    | : half the width separating columns in an array environment                                                                                                                                                         |
| \tabcolsep      | : half the width separating columns in a tabular environment                                                                                                                                                        |
| \arrayrulewidth | : width of rules                                                                                                                                                                                                    |
| \doublerulesep  | : space between adjacent rules in array or tabular                                                                                                                                                                  |
| \arraystretch   | : line spacing in array and tabular environments is done by<br>placing a strut in every row of height and depth<br>\arraystretch times the height and depth of the strut<br>produced by an ordinary \strut command. |

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

|           |                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------|
| l,r,c     | : indicate where entry is to be placed.                                                              |
|           | : for vertical rule                                                                                  |
| @{EXP}    | : inserts the text EXP in every column.<br>\arraycolsep or \tabcolsep spacing is suppressed.         |
| *{N}{PRE} | : equivalent to writing N copies of PRE in the preamble.<br>PRE may contain *{N'}{EXP'} expressions. |
| p{LEN}    | : makes entry in parbox of width LEN.                                                                |

SPECIAL ARRAY COMMANDS:

```

\multicolumn{N}{FORMAT}{ITEM} : replaces the next N column
 items by ITEM, formatted according to FORMAT.
 FORMAT should contain at most one l,r or c.
 If it contains none, then ITEM is ignored.

\vline : draws a vertical line the height of the current row. May
 appear in an array element entry.
\hline : draws a horizontal line between rows. Must appear either
 before the first entry (to appear above the first row) or
 right after a \\ command. If followed by another \hline,
 then adds a \vskip of \doublerulesep.

\cline{i-j} : draws horizontal lines between rows covering columns
 i through j, inclusive. Multiple commands may follow
 one another to provide lines covering several disjoint
 columns
\extracolsep{WIDTH} : for use inside an @ in the preamble. Causes
 a WIDTH space to be added between columns for the rest
 of the columns. This is in addition to the ordinary
 intercolumn space.

183 \if #1t\vtop \else \if#1b\vbox \else \vcenter \fi\fi

```
184 \bgroup
```

This next bit of code sets up the strut and then builds the `halign` and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the `\@arstrut` below is expanded and contains an `\ifmmode` then it could produce an unnecessary extra box in every row, thus wasting ‘lots of’ main memory.

```
185 \setbox\@arstrutbox\hbox{%
186 \vrule \height\arraystretch\ht\strutbox
187 \depth\arraystretch \dp\strutbox
188 \width\z@\%
189 \mkpream{#2}%
190 \edef\@preamble{%
191 \ialign \noexpand\@halignto
192 \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%
193 }
```

That is the end of setting up the preamble; now we reset things before executing the `halign` built-up in `\@preamble`. The restorations could be done by introducing an extra group, thus saving tokens.

```
193 \let\@startpbox\@startpbox \let\@endpbox\@endpbox
194 \let\tabularnewline\\%
195 \let\par\empty
196 \let\sharp##%
197 \set@typeset@protect
198 \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there may be some characters left which TeX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the `\halign` expects vertical mode thus issues a `\par` but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

The command \def\caddamp{} was removed from \multicolumn on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the \multicolumn command had two column specifiers.

8 Feb 89 — \hbox{} added after \preamble to correct bug that occurred if \multicolumn preceded \\[D] with D > 0, caused by \\[] command doing an \unskip, which removed \tabcolsep glue inserted by \multicolumn.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

Codes for classes and character numbers of array, tabular and multicolumn arguments.

| Character | Class | Number |
|-----------|-------|--------|
| c         | 0     | 0      |
| l         | 0     | 1      |
| r         | 0     | 2      |
|           | 1     | -      |
| @         | 2     | -      |
| p         | 3     | -      |
| {@-exp}   | 4     | -      |
| {p-arg}   | 5     | -      |

\@testpach \foo : expands \foo, which should be an array parameter

token, and sets `\@chclass` and `\@chnum` to its class and number. Uses `\@lastchclass` to distinguish 4 and 5

Preamble error codes

- 0: 'illegal character'
- 1: 'Missing @-exp'
- 2: 'Missing p-arg'

(End definition for `\vline`.)

`\cline` The old L<sup>A</sup>T<sub>E</sub>X2.09 implementation of `\cline` used up quite a lot of memory and two precious count registers. This new (1995/09/14) implementation does not use any count registers. It is coded in a way that depends heavily on the definition of `\multispan` so that command has been moved here from the file `lplain.dtx`.

These counters are no longer declared.

```

\newcount\@cla
\newcount\@clb

367 \def\cline#1{\@cline#1\@nil}

368 \def\@cline#1-#2\@nil{%
369 \omit

```

Use the counter from `\multispan`.

```

370 \multicnt#1%
371 \advance\multispan\m@ne
372 \ifnum\multicnt=\@ne\@firstofone{\&\omit}\fi
373 \multicnt#2%
374 \advance\multicnt-#1%
375 \advance\multispan\@ne

```

The original had `\unskip` at this point, but how could a skip get here ???

```

376 \leaders\hrule\@height\arrayrulewidth\hfill
377 \cr

```

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make `\cline` look ahead for a following `\cline` as does `\hline`. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

```
378 \noalign{\vskip-\arrayrulewidth}}
```

(End definition for `\cline` and `\@cline`.)

`\mscount` The `\mscount` counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

(End definition for `\mscount`.)

`\multispan` Modify `\multispan` slightly from its plain T<sub>E</sub>X definition to allow more efficient code sharing with `\multicolumn`. Also share a count register with `\multiput`.

```

\sp@n 379 \def\multispan{\omit\@multispan}
380 \def\@multispan#1{%
381 \multicnt#1\relax
382 \loop\ifnum\multicnt>\@ne \sp@n\repeat}
383 \def\sp@n{\span\omit\advance\multicnt\m@ne}

```

(End definition for `\multispan`, `\@multispan`, and `\sp@n`.)

`\@startpbox` Helper macros for ‘p’ columns.

```

\@endpbox 384 \def\@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}
 \@startpbox{width} text \egroup is essentially \parbox{width}{text}
 \@endpbox is essentially \unskip \strut \par \egroup\hfil (Changed 14 Jan 89)
 (changed again 1994/05/13)

```

```
384 \def\@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}
```

```
385 \def\@endpbox{\@finalstrut\@arstrutbox\par\egroup\hfil}
14 Jan 89: Def of \@endpbox changed from
\def\@endpbox{\par\vskip\dp\@arstrutbox\egroup\hfil}
so vertical spacing works out right if the last line of a ‘p’ entry has a descender.
```

(*End definition for \@startpbox and \@endpbox.*)

```
\@@startpbox

## ltpictur.dtx

### 1 Picture Mode

Picture mode commands. In addition to the commands available in L<sup>A</sup>T<sub>E</sub>X2.09, This section adds the new \qbezier command for drawing curves.

\qbezier \qbezier[ $\langle N \rangle$ ] ( $\langle AX,AY \rangle$ ) ( $\langle BX,BY \rangle$ ) ( $\langle CX,CY \rangle$ ) plots a quadratic Bezier curve from ( $\langle AX,AY \rangle$ ) to ( $\langle CX,CY \rangle$ ), with ( $\langle BX,BY \rangle$ ) as the third Bezier point, using  $N+1$  points equally spaced parametrically. If  $N = 0$  (the default value), then a sufficient number of points are used to draw a connected curve—except that at most \qbeziermax+1 points are drawn. A “point” is a square of side \@wholewidth.

\bezier In addition, to be compatible with the old **bezier** package, a variant of this command, \bezier, is defined, in which the first argument is not optional.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

|              |                               |

\@picht
 6 \newbox\@picbox
 7 \newdimen\@picht

```

*(End definition for \@picbox and \@picht.)*

\@defaultunitsset Set a length register, #1, accepting number or an etex length expression, #2, with default unit, #3.

The register name in #1 can be prefixed by \advance so that the register is incremented by the supplied value.

```
\@defaultunitsset{\advance\@vxx}{\textwidth-15pt}\unitlength
#3 can be a literal unit such as cm or a length register such as \unitlength.
```

This is used in all `picture` commands that take picture coordinates. So `\put(2,2)` as previously but now `\put(\textwidth-5cm,0.4\textheight)` Note that you can only use expressions with lengths, `\put(1+2,0)` is not supported.

```

## CIRCLES AND OVALS

### USER COMMANDS:

\circle{D} : Produces the circle with the diameter as close as possible to D \* \unitlength. \put(X,Y){\circle{D}} puts the circle with its center at (X,Y).

\oval(X,Y) : Makes an oval as round as possible that fits in the rectangle of width X \* \unitlength and height Y \* \unitlength. The reference point is the center.

\oval(X,Y)[POS] : Save as \oval(X,Y) except it draws only the half or quadrant of the oval indicated by POS. E.G., \oval(X,Y)[t] draws just the top half and \oval(X,Y)[br] draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified \oval(X,Y) command.

\@ovvert {DELTA1} {DELTA2} : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical

rule. The width of the box will be `\@tempdima`.  
 DELTA1 and DELTA2 are added to the character number in `\@tempcnta` to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval.  
 The width of the box will be `\@ovxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number of the top-right quarter circle with the largest diameter less than or equal to DIAM.  
 Sets `\@tempboxa` to an hbox containing that character.  
 Sets `\@tempdima` to `\wd \@tempboxa`, which is the distance from the circle's left outside edge to its right inside edge.  
 (These characters are like those described in the TeXbook, pp. 389-90.)

## ltthm.dtx

### 1 Theorem Environments

The user creates his own theorem-like environments with the command

`\newtheorem{<name>}{<text>}[<counter>]` or  
`\newtheorem{<name>}[<oldname>]{<text>}`

This defines the environment `<name>` to be just as one would expect a theorem environment to be, except that it prints `<text>` instead of “Theorem”.

If `<oldname>` is given, then environments `<name>` and `<oldname>` use the same counter, so using a `<name>` environment advances the number of the next `<name>` environment, and vice-versa.

If `<counter>` is given, then environment `<name>` is numbered within `<counter>`.

E.g., if `<counter>` = `subsection`, then the first `<name>` in subsection 7.2 is numbered `<text> 7.2.1`.

The way `<name>` environments are numbered can be changed by redefining `\the<name>`.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

#### DOCUMENT STYLE PARAMETERS

`\@thmcnter{COUNTER}` : A command such that

`\edef\theCOUNTER{\@thmcnter{COUNTER}}`

defines `\theCOUNTER` to produce a number for a theorem environment.

The default is:

`BEGIN \noexpand\arabic{COUNTER} END`

`\@thmcntersep` : A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, `\@thmcntersep` should be `\def`'ed to `'-`. Its default is `"`.

`\@begintheorem{NAME}{NUMBER}` : A command that begins a theorem environment for a ‘theorem’ named ‘NAME NUMBER’ – e.g., `\@begintheorem{Lemma}{3.7}` starts Lemma 3.7.

`\@opargbegintheorem{NAME}{NUMBER}{OPARG}` :

A command that begins a theorem environment for a ‘theorem’ named ‘NAME NUMBER’ with optional argument OPARG – e.g., `\@begintheorem{Lemma}{3.7}{Jones}` starts ‘Lemma 3.7 (Jones):’.

`\@endtheorem` : A command that ends a theorem environment.

`\newtheorem{NAME}{TEXT}[COUNTER] ==`

`BEGIN`  
if `\NAME` is definable

```

then \@definecounter{NAME}
 if COUNTER present
 then \@newctr{NAME}[COUNTER] fi
 \theNAME == BEGIN \theCOUNTER \@thmcOUNTERsep
 eval\@thmcOUNTER{NAME} END
 else \theNAME == BEGIN eval\@thmcOUNTER{NAME} END
 \NAME == \@thm{NAME}{TEXT}
 \endNAME == \@endtheorem
 else error
 fi
 END

\newtheorem{NAME}[OLDNAME]{TEXT} ==
BEGIN
 if counter OLDNAME nonexistent
 then ERROR
 else
 if \NAME is definable
 then BEGIN
 \theNAME == \theOLDNAME
 \NAME == \@thm{OLDNAME}{TEXT}
 \endNAME == \@endtheorem
 END
 else error
 fi
END

\@thm{NAME}{TEXT} ==
BEGIN
 \refstepcounter{NAME}
 if next char =
 then \@ythm{NAME}{TEXT}
 else \@xthm{NAME}{TEXT}
 fi
END

\@xthm{NAME}{TEXT} ==
BEGIN
 \begin{theorem}{\theNAME}
 \ignorespaces
 END

\@ythm{NAME}{TEXT}[OPARG] ==
BEGIN
 \opargbegintheorem{TEXT}{\theNAME}{OPARG}
 \ignorespaces
END

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

\newtheorem \newtheorem ought really be allowed only in the preamble. Which would be good document style, and allow some main memory to be saved by declaring these commands to be \onlypreamble. Unfortunately the L<sup>A</sup>T<sub>E</sub>X book indicates that \newtheorem may be used anywhere in the document...

## ltsect.dtx

### 1 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L<sup>A</sup>T<sub>E</sub>X kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 {*2ekernel}
2 \message{title,}
```

#### 1.1 The Title

`\title` The user defines the title and author by the declarations `\title{<name>}`, `\author{<name>}`.  
`\author` Similarly the date is declared with `\date{<date>}`.  
`\date` Inside these, the `\thanks{<footnote text>}` command may be used to make acknowledgements, notice of address, etc. in a footnote. If there are multiple authors, they have `\and` to be separated with the `\and` command.  
`\maketitle` And finally, the `\maketitle` command produces the actual title, using the information previously saved with the other commands.

```
3 /2ekernel
4 {*2ekernel | latexrelease}
5 {latexrelease}\IncludeInRelease{2019/10/01}%
6 {latexrelease} {\title}{Make commands robust}%
```

`\title` `\title` for use in `\maketitle`. If not given `\maketitle` will produce an error message.  
7 `\DeclareRobustCommand\title[1]{\gdef\@title{\#1}}`

(End definition for `\title`.)

`\author` `\author` for use in `\maketitle`. If not given `\maketitle` will produce a warning message.  
8 `\DeclareRobustCommand*\author[1]{\gdef\@author{\#1}}`

(End definition for `\author`.)

`\date` `\date` for use in `\maketitle`. If not given `\maketitle` will produce `\today` as the default.

```
9 \DeclareRobustCommand*\date[1]{\gdef\@date{\#1}}
```

(End definition for `\date`.)

`\thanks`  
10 `\DeclareRobustCommand\thanks[1]{\footnotemark}`  
11     `\protected\@xdef\@thanks{\@thanks`  
12         `\protect\footnotetext[\the\c@footnote]{\#1}}%`  
13 }

(End definition for `\thanks`.)

```

\and
14 \DeclareRobustCommand{\and}{%
15 \end{tabular}%
16 \hskip 1em \oplus .17fil%
17 \begin{tabular}[t]{c}}% \end{tabular}

(End definition for \and.)

18 </2ekernel | latexrelease>
19 <latexrelease>\EndIncludeInRelease
20 <latexrelease>\IncludeInRelease{0000/00/00}%
21 <latexrelease> {\title}{Make commands robust}%
22 <latexrelease>
23 <latexrelease>\kernel@make@fragile\title
24 <latexrelease>\kernel@make@fragile\author
25 <latexrelease>\kernel@make@fragile\date
26 <latexrelease>\kernel@make@fragile\thanks
27 <latexrelease>\kernel@make@fragile\and
28 <latexrelease>
29 <latexrelease>\EndIncludeInRelease
30 <*2ekernel>

\@title
31 \def\@title{\@latex@error{No \noexpand\title given}\@ehc}

(End definition for \@title.)

\@author
32 \def\@author{\@latex@warning@no@line{No \noexpand\author given}{}}

(End definition for \@author.)

\@date
33 \gdef\@date{\today}

(End definition for \@date.)

\@thanks
34 \let\@thanks\empty

(End definition for \@thanks.)

35 \message{sectioning,}

```

## 1.2 Sectioning

```

\@secpenalty
36 \newcount\@secpenalty
37 \@secpenalty = -300

(End definition for \@secpenalty.)

\if@noskipsec Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the
\@noskipsectrue preamble and to false in \document. This was done to trap lists and related text in the
preamble but it does not catch everything.
38 \newif\if@noskipsec \@noskipsectrue

```

(End definition for `\if@noskipsec` and `\@noskipsectrue`.)

`\@startsection` The `\@startsection{\langle name \rangle}{\langle level \rangle}{\langle indent \rangle}{\langle beforeskip \rangle}{\langle afterskip \rangle}{\langle style \rangle}*` command is the mother of all the user level sectioning commands. The part after the \*, including the \* is optional.

**name:** e.g., 'subsection'

**level:** a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

**indent:** Indentation of heading from left margin

**beforeskip:** Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

**afterskip:** if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

**style:** Commands to set style. Since June 1996 release the `last` command in this argument may be a command such as `\MakeUppercase` or `\fbox` that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, `\bfseries\MakeUppercase` would produce bold, uppercase headings.

If '\*' is missing, then increment the counter. If it is present, then there should be no [`\altheading`] argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

**Warning:** The `\@startsection` command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
 \paragraph{...}
 \endgroup}
```

Pseudocode for the `\@startsection` command *Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments* (not necessarily accurate any more):

```
\@startsection
{NAME}{LEVEL}{INDENT}{BEFORESKIP}{AFTERSKIP}{STYLE} ==
BEGIN
 IF @noskipsec = T THEN \leavevmode FI
 % true if previous section had no body.

 \par

```

(End definition for \sectionmark and others.)

<sup>148</sup> \message{contents,}

## 1.3 Table of Contents etc.

### 1.3.1 Convention

\tf@{foo} = file number for output for table foo. The file is opened only if @filesw = true.

### 1.3.2 Commands

A \l@{type}{\{entry\}}{\{page\}} Macro needs to defined by document style for making an entry of type *type* in a table of contents, etc. E.g., the document style should define \l@chapter, \l@section, etc.

**Note:** When the \protect command is used in the *entry* or *text* of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

**Surprise:** Inside an \addcontentsline or \addtocontents command argument, the commands: \index, \glossary, and \label are no-ops . This could cause a problem if the user puts an \index or \label into one of the commands he writes, or into the optional ‘short version’ argument of a \section or \caption command.

\starttoc The \starttoc{\ext} command is used to define the commands:  
\tableofcontents, \listoffigures, etc.

For example: \starttoc{lof} is used in \listoffigures. This command reads the .\ext file and sets up to write the new .\ext file.

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

\starttoc{EXT} ==

```

BEGIN
 \begingroup
 \makeatletter
 read file \jobname.EXT
 IF @filesw = true
 THEN open \jobname.EXT as file \tf@EXT
 FI
 @nobreak :=G FALSE %% added 24 May 89
 \endgroup
END

```

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

```

149 \def\@starttoc#1{%
150 \begingroup
151 \makeatletter
152 \cinput{\jobname.#1}%
153 \if@filesw
154 \expandafter\newwrite\csname tf@#1\endcsname
155 \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
156 \fi
157 \nobreakfalse
158 \endgroup}

```

*(End definition for \@starttoc.)*

\addcontentsline The \addcontentsline{\langle table\rangle}{\langle type\rangle}{\langle entry\rangle} command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry \contentsline{\langle type\rangle}{\langle entry\rangle}{\langle page\rangle}{\{} to the .\langle table\rangle file.

This macro is implemented as an application of \addtocontents. Note that \thepage is not expandable during \protected@write therefore one gets the page number at the time of the \shipout.

```

159 </2ekernel>
160 <2ekernel | latexrelease>
161 <latexrelease>\IncludeInRelease{2020/10/01}%
162 <latexrelease> {\addcontentsline}{fourth argument}%
163 \def\addcontentsline#1#2#3{%

```

We add an empty brace pair at the end of \contentsline so that the number of argument is identical in documents with and without hyperref.

```

164 \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}{\{}%
165 \protected@file@percent}%
166 </2ekernel | latexrelease>
167 <latexrelease>\EndIncludeInRelease
168 <latexrelease>\IncludeInRelease{2018/12/01}%
169 <latexrelease> {\addcontentsline}{Mask line endings}%
170 <latexrelease> \def\addcontentsline#1#2#3{%
171 <latexrelease> \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}%

```

We add \protected@file@percent at the end which is turned inside \@writefile into a percent character to mask the newline after the closing argument brace.

```

172 <latexrelease> \protected@file@percent}%
173 <latexrelease>\EndIncludeInRelease
174 <latexrelease>\IncludeInRelease{0000/00/00}%
175 <latexrelease> {\addcontentsline}{Mask line endings}%

```

```

176 ⟨latexrelease⟩\def\addcontentsline#1#2#3{%
177 ⟨latexrelease⟩ \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}}
178 ⟨latexrelease⟩\EndIncludeInRelease
179 ⟨*2ekernel⟩

```

(End definition for `\addcontentsline`.)

`\addtocontents` The `\addtocontents{⟨table⟩}{⟨text⟩}` command adds `⟨text⟩` to the `.⟨table⟩` file, with no page number.

```

180 \long\def\addtocontents#1#2{%
181 \protected@write\@auxout
182 {\let\label\@gobble \let\index\@gobble \let\glossary\@gobble}%
183 {\string\@writefile{#1}{#2}}}

```

(End definition for `\addtocontents`.)

`\contentsline` The `\contentsline{⟨type⟩}{⟨entry⟩}{⟨page⟩}{}` macro produces a `⟨type⟩` entry in a table of contents, etc. It will appear in the `.toc` or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```

\contentsline{subsection}
{\makebox{30pt}[r]{1.4.3} Gnats and Gnus}{22}

```

The `\protect` command causes command sequences to be written without expanding them.

```

184 ⟨/2ekernel⟩
185 ⟨*2ekernel | latexrelease⟩
186 ⟨latexrelease⟩\IncludeInRelease{2021/11/15}%
187 ⟨latexrelease⟩ {\contentsline}{Four arguments}%

```

In the toc file `\contentsline` is followed by 4 arguments these days, but only the first 3 are used in the old interface. The fourth was by default empty and only used when `hyperref` was loaded. We now pick up all 4 arguments, save the last one away in `\@contentsline@destination` and then call the old interface. This is done to simplify the interface to `hyperref` and to prepare for future changes.

```

188 \def\contentsline#1#2#3#4{\gdef\@contentsline@destination{#4}%
189 \csname l@#1\endcsname{#2}{#3}}

```

Default definition.

```

190 \let\@contentsline@destination\empty
191 ⟨/2ekernel | latexrelease⟩
192 ⟨latexrelease⟩\EndIncludeInRelease
193 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
194 ⟨latexrelease⟩ {\contentsline}{Four arguments}%
195 ⟨latexrelease⟩
196 ⟨latexrelease⟩\def\contentsline#1{\csname l@#1\endcsname}
197 ⟨latexrelease⟩\let\@contentsline@destination\undefined
198 ⟨latexrelease⟩\EndIncludeInRelease
199 ⟨*2ekernel⟩

```

(End definition for `\contentsline`.)

`\@dottedtocline{⟨level⟩}{⟨indent⟩}{⟨numwidth⟩}{⟨title⟩}{⟨page⟩}`: Macro to produce a table of contents line with the following parameters:

**level** If  $\langle level \rangle > \c@tocdepth$ , then no line produced.

**indent** Total indentation from the left margin.

**numwidth** Width of box for number if the  $\langle title \rangle$  has a `\numberline` command. As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

**title** Contents of entry.

**page** Page number.

Uses the following parameters, which must be set by the document style. They should be defined with `\def`'s.

**pnumwidth** Width of box in which page number is set.

**tocrmarg** Right margin indentation for all but last line of multiple-line entries.

**dotsep** Separation between dots, in mu units. Should be `\def`'d to a number like 2 or 1.7

#### \@dottedtocline

```
200 {/2ekernel}
201 {*2ekernel | latexrelease}
202 {latexrelease}\IncludeInRelease{2018/12/01}%
203 {latexrelease} {\@dottedtocline}{Prevent protrusion}%
204 \def\@dottedtocline#1#2#3#4#5{%
205 \ifnum #1>\c@tocdepth \else
206 \vskip \z@ \oplus .2\p@
207 {\leftskip #2\relax \rightskip \c@tocrmarg \parfillskip -\rightskip
208 \parindent #2\relax\@afterindenttrue
209 \interlinepenalty\@M
210 \leavevmode

212 \advance\leftskip \c@tempdima \null\nobreak\hskip -\leftskip
213 {#4}\nobreak
214 \leaders\hbox{$\m@th
```

If a document uses fonts other than computer modern, the use of a dot from math can be very disturbing despite the fact that this might be the only place in a document that then uses computer modern. Therefore we surround the dot with an `\hbox` to escape to the surrounding text font.

```
215 \mkern \@dotsep mu\hbox{.}\mkern \@dotsep
216 mu\$}\hfill
217 \nobreak
218 \hb@xt@\c@pnumwidth{\hfil\normalfont \normalcolor #5%
```

We finish off by preventing any protrusion if that is enabled. If protrusion happens the number may shift to the right and as a result you may end up with an additional dot in the toc line in some situations.

```
219 \kern-\p@\kern\p@}%
220 \par}%
221 \fi}
```

(End definition for \dottedtocline.)

- \noprotrusion This command, if placed directly to the right (or left) of a word, will prevent protrusion of that word into the margin. It is used in the toc entry lines as they shouldn't protrude. It is implemented as to kerns that cancel each other but being there hide the word so that protrusion is not added. Note that a zero kern or an empty box would not work as the protrusion mechanism will skip over those.

222 \DeclareRobustCommand\noprotrusion{\leavevmode\kern-\p@\kern\p@}

(End definition for \noprotrusion.)

```
223 </2ekernel | latexrelease>
224 <latexrelease>\EndIncludeInRelease
225 <latexrelease>\IncludeInRelease{0000/00/00}%
226 <latexrelease> {\@dottedtocline}{Prevent protrusion}%
227 <latexrelease>\def\@dottedtocline#1#2#3#4#5{%
228 <latexrelease> \ifnum #1>\c@tocdepth \else
229 <latexrelease> \vskip \z@ \oplus .2\p@
230 <latexrelease> {\leftskip #2\relax \rightskip \z@ \parfillskip -\rightskip
231 <latexrelease> \parindent #2\relax \afterindenttrue
232 <latexrelease> \interlinepenalty\OM
233 <latexrelease> \leavevmode
234 <latexrelease> \tempdima #3\relax
235 <latexrelease> \advance\leftskip \tempdima \null\nobreak\hskip -\leftskip
236 <latexrelease> {#4}\nobreak
237 <latexrelease> \leaders\hbox{$\m@th
238 <latexrelease> \mkern \z@ \dotsep \mu\hbox{.}\mkern \z@ \dotsep
239 <latexrelease> \mu\$}\hfill
240 <latexrelease> \nobreak
241 <latexrelease> \hb@xt@\pnumwidth{\hfil\normalfont \normalcolor #5}%
242 <latexrelease> \par}%
243 <latexrelease> \fi}
244 <latexrelease>
245 <latexrelease>\let\noprotrusion\undefined
246 <latexrelease>\EndIncludeInRelease
247 </2ekernel>
```

**Note:** \nobreak's added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use \leftskip instead of \hangindent so leaders of multiple-line contents entries would line up properly.

- \numberline \numberline{\langle number\rangle}: For use in a \contentsline command. It puts \langle number\rangle flush-left in a box of width \tempdima (Before 25 Jan 88 change, it also added \tempdima to the hanging indentation.)

248 \def\numberline#1{\hb@xt@\tempdima{\hfil}}
249 </2ekernel>

(End definition for \numberline.)

# File P

## ltfloat.dtx

### 1 Floats

The different types of floats are identified by a *<type>* name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each *<type>* has associated a positive *<type number>*, which is a power of two. E.g.,

figures might be have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a *<placement specifier>*, which is a list of the possible locations, each denoted by a letter as follows:

- h : here — at the current location in the text.
- t : top — at the top of a text page.
- b : bottom — at the bottom of a text page.
- p : page — on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

#### 1.1 Floating Environments

```
1 {*2ekernel}
2 \message{floats,}
```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

```
\c@topnumber : Number of floats allowed at the top of a column.
\topfraction : Fraction of column that can be devoted to floats.
\c@dbltopnumber, \dbltopfraction
 : Same as above, but for double-column floats.
\c@bottomnumber, \bottomfraction
 : Same as above for bottom of page.
\c@totalnumber : Number of floats allowed in a single column,
 including in-text floats.
{textfraction} : Minimum fraction of column that must contain text.
{floatpagefraction}: Minimum fraction of page that must be taken
 up by float page.
{dblfloatpagefraction}
 : Same as above, for double-column floats.
```

The document style must define the following.

```
\fps@TYPE : The default placement specifier for floats of type
 TYPE.

\ftype@TYPE : The type number for floats of type TYPE.

\ext@TYPE : The file extension indicating the file on which the
 contents list for float type TYPE is stored.
 For example, \ext@figure = 'lof'.

\fnum@TYPE : A macro to generate the figure number for a caption.
 For example, \fnum@TYPE == Figure \thefigure.

\@makecaption{NUM}{TEXT} :
 A macro to make a caption, with NUM the value
 produced by \fnum@... and TEXT the text of the caption.
 It can assume it's in a \parbox of the appropriate width.

\@float{TYPE}[PLACEMENT] : This macro begins a float environment for a
 single-column float of type TYPE with PLACEMENT as the placement
 specifier. The default value of PLACEMENT is defined by
 \fps@TYPE. The environment is ended by \end@float.
 E.g., \figure == \@float{figure}, \endfigure == \end@float.

\@float{TYPE}[PLACEMENT] ==
BEGIN
 if hmode then \@bsphack
 \@floatpenalty := -10002
 else \@floatpenalty := -10003
 fi
 \@capttype ==L TYPE
 \@dblflset
 \@fps ==L PLACEMENT
 \@onellevel@sanitize \@fps
 add default PLACEMENT if at most ! in PLACEMENT ==
\@fpsadddefault
 if inner
 then LaTeX Error: 'Not in outer paragraph mode.'
 \@floatpenalty := 0
 else if \@freelist nonempty
 then \@currbox :=L head of \@freelist
 \@freelist :=G tail of \@freelist
 \count@\currbox :=G 32*\ftype@TYPE +
 bits determined by PLACEMENT
 else \@floatpenalty := 0
 LaTeX Error: 'Too many unprocessed floats'
 fi
 fi
 \@currbox :=G \color@vbox
```

```

\normalcolor
\vbox{
%% 15 Dec 87 -

%% that made box 0 depth because it screwed
%% things up. Instead, added \vskip0pt at end
\hsize = \columnwidth
\@parboxrestore
\@floatboxreset
END

\caption ==
BEGIN
\refstepcounter{@capter}
\@dblarg{@caption{@capter}}
END

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\@caption{TYPE}[STEXT]{TEXT} ==
BEGIN
\par
\addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
\begingroup
\@parboxrestore
\@normalsize
\@makecaption{\fnum@TYPE}{TEXT}
\par
\endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'. The environment is ended by `\end@dblfloat`.  
E.g., `\figure*` == `\@dblfloat{figure}`,  
`\endfigure*` == `\end@dblfloat`.

```

\@dblfloat{TYPE}[PLACEMENT] ==
Identical to \@float{TYPE}[PLACEMENT] except \hsize and \linewidth
are set to \textwidth.
End of historical LATEX 2.09 comments.

```

`\@floatpenalty`  
<sup>3</sup> `\newcount\@floatpenalty`

(End definition for `\@floatpenalty`.)

`\caption` This is set to be an error message outside a float since no `capttype` is defined there; this may need to be changed by some classes.

```

4 \def\caption{%
5 \ifx\@capttype\undefined
6 \@latex@error{\noexpand\caption outside float}\@ehd
7 \expandafter\@gobble
8 \else
9 \refstepcounter\@capttype
10 \expandafter\@firstofone
11 \fi
12 { \@dblarg{\@caption\@capttype} }%
13 }

```

(End definition for `\caption`.)

`\@caption`

```

14 \long\def\@caption#1[#2]#3{%
15 \par
16 \addcontentsline{\csname ext@\#1\endcsname}{\#1}%
17 {\protect\numberline{\csname the#\#1\endcsname}{\ignorespaces #2}}%
18 \begingroup

```

The paragraph setting parameters are normalised at this point, however `\@parboxrestore` resets `\everypar` which is not correct in this context so `\@setminipage` is called if needed.

The float mechanism, like `minipage`, sets the flag `@minipage` true before executing the user-supplied text. Many L<sup>A</sup>T<sub>E</sub>X constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates T<sub>E</sub>X's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of `\everypar`, but the call to `\@parboxrestore` removes that redefinition, so it is re-inserted if needed. If the flag is already false then the `\caption` was not the first entry in the float, and so some other paragraph has already activated the special `\everypar`. In this case no further action is needed.

```

19 \@parboxrestore
20 \if@minipage
21 \@setminipage
22 \fi
23 \normalsize
24 \makecaption{\csname fnum@\#1\endcsname}{\ignorespaces #3}\par
25 \endgroup

```

(End definition for `\@caption`.)

`\@float`

```

\@dblfset 26 \def\@float#1{%
27 \@ifnextchar[%]
28 {\@xflocat{\#1}}%
29 {\edef\reserved@a{\noexpand\@xfloat{\#1}[\csname fps@\#1\endcsname]}%
30 \reserved@a}

```

(End definition for `\@float` and `\@dblfset`.)

`\@dblffloat`

```

31 \def\@dblffloat{%
32 \if@twocolumn\let\reserved@a\@dbflft\else\let\reserved@a\@float\fi
33 \reserved@a}

```

(End definition for \dblfloat.)

\fps@dbl Note that all double floats have default fps ‘tp’.

(End definition for \fps@dbl.)

\@setfps This sets the fps, dealing with error conditions by adding the default.

(End definition for \@setfps.)

\@xfloat The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters.

It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

\@floatboxreset The rational for allowing these normally global flags to be set locally here, via \parboxrestore, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in \setnobreak; otherwise this command will be redundant.

(End definition for \dblfloatplacement.)

Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the \output routine. Marginal notes are distinguished from floats by having a negative placement specification. The command \marginpar [LTEXT]{RTEXT} generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

```
\marginparwidth : Width of marginal notes.
\marginparsep : Distance between marginal note and text.
 the page layout to determine how to move the marginal
 note into the margin. E.g., \leftmarginskip ==
 \hskip -\marginparwidth \hskip -\marginparsep .
\marginparpush : Minimum vertical separation between \marginpar's
```

Marginal notes are normally put on the outside of the page if @mparswitch = true, and on the right if @mparswitch = false. The command \reversemarginpar reverses the side where they are put. \normalmarginpar undoes \reversemarginpar. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```
\marginpar [LTEXT]{RTEXT} ==

(End definition for `\@savemarbox`.)

`\marginparreset` The rational for allowing these normally global flags to be set locally here, via `\parboxrestore` was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

```

370 \def \marginparreset {%
371 \reset@font
372 \normalsize
373 \% \let\if@nobreak\iffalse
374 \% \let\if@noskipsec\iffalse

```

```

375 % \@setnobreak
376 \@setminipage
377 }

(End definition for \@marginparreset.)
```

### \@xympar

Setting the box here is done only because the code uses `\end@float`; it will be empty and gets discarded.

```

```

## 1.2 Footnotes

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

`\footnote{NOTE}` : User command to insert a footnote.

`\footnote[NUM]{NOTE}`: User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered \*, \*\*, etc. within pages, then `\footnote[2]{...}` produces footnote \*\*. This command does not step the footnote counter.

`\footnotemark[NUM]` : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

`\footnotetext[NUM]{TEXT}` : Command to produce the footnote but no mark. `\footnote` is equivalent to `\footnotemark \footnotetext`.

As in PLAIN, footnotes use `\insert\footins`, and the following parameters:

**\footnotesize** : Size-changing command for footnotes.

**\footnotesep** : The height of a strut placed at the beginning of every footnote.

**\skip\footins** : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height **\footnotesep** which is at the beginning of the first footnote.

**\footnoterule** : Macro to draw the rule separating footnotes from text. It is executed right after a **\vspace** of **\skip\footins**. It should take zero vertical space—i.e., it should skip to a negative value to compensate for any positive space it occupies. (See PLAIN.TEX.)

**\interfootnotelinepenalty** : Interline penalty for footnotes.

**\thefootnote** : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an **\@addtoreset** command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

**\@thefnmark** : Holds the current footnote's mark—e.g., **\dag** or '1' or 'a'.

**\@mpfnnumber** : A macro that generates the numbers for **\footnote** and **\footnotemark** commands. It == **\thefootnote** outside a **minipage** environment, but can be changed inside to generate numbers for **\footnote**'s.

**\@makefnmark** : A macro to generate the footnote marker from **\@thefnmark**. The default definition was **\hbox{\$^{\@thefnmark}\$}**.

This is now replaced by  
 $\text{\textsuperscript}{\@thefnmark}$

**\@makefntext{NOTE}** :

Must produce the actual footnote, using **\@thefnmark** as the mark of the footnote and NOTE as the text. It is called when effectively inside a **\parbox**, with **\hsize = \columnwidth**. For example, it might be as simple as  
 $\$^{\@thefnmark}\$ \text{ NOTE}$

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

- (a) they use the counter `mpfootnote`
  - (b) the footnotes they produce go at the bottom of the minipage.
- The switch is accomplished by letting `\@mpfn == footnote` or `mpfootnote` and `\@thempfn == \thefootnote` or `\thempfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the minipage.

```

## ltbibl.dtx

### 1 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The BIBTEX program will create a file containing such an environment, which will be read in by the `\bibliography` command. With BIBTEX, the following commands will be used.

`\bibliography{<file1,<file2, ...,<filen>}` : specifies the bibdata files. Writes a `\bibdata` entry on the `.aux` file and tries to read in `mainfile.bbl`.

`\bibliographystyle{<style>}` : Writes a `\bibstyle` entry on the `.aux` file.  
`thebibliography (env.)`

The `thebibliography` environment is a list environment. To save the use of an extra counter, it should use `enumiv` as the item counter. Instead of using `\item`, items in the bibliography are produced by the following commands:

`\bibitem{<name>}` : Produces a numbered entry cited as `<name>`.  
`\bibitem[<label>]{<name>}` : Produces an entry labeled by `<Label>` and cited by `<name>`.

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

`\cite` Entries are cited by the command `\cite{<name>}`.  
`\nocite` `\nocite{<citations>}` puts information on the `.aux` file that causes BIBTEX to include the `{<citations>}` list in the bibliography, but puts nothing in the text.  
`\nocite{*}` is special: it tells BIBTEX to put the whole of a collection of references into the bibliography.

1 `(*2ekernel)`  
2 `\message{bibliography,}`

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

PARAMETERS

`\@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}` command, where entry FOOi is defined by `\bibitem[LABELi]{FOOi}`.

The switch `@tempswa` is true if the optional NOTE argument is present.

The default definition is :

```
\@cite{LABELS}{NOTE} ==
BEGIN [LABELS
 IF @tempswa = T THEN , NOTE FI
]
END
```

`\@biblabel` : A macro to produce the label in the bibliography entry. For `\bibitem[LABEL]{NAME}`, the label is

generated by `\@biblabel{LABEL}`. It has the default definition `\@biblabel{LABEL} -> [LABEL]`.

## CONVENTION

`\b@FOO` : The name or number of the reference created by `\cite{FOO}`  
E.g., if `\cite{FOO} -> [17]`, then `\b@FOO -> 17`.

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

14 <latexrelease>\IncludeInRelease{2022/06/01}%
15 <latexrelease> {\cite}{check for blank}%
16 \DeclareRobustCommand\cite{%
17 \@ifnextchar [{\@tempswattrue\@citex@checkblank}{\@tempswafalse\@citex@checkblank[]}}}
```

Due to the way `\for` as used in `\@citex` behaves an empty argument to `\cite` did not produce any warning for a missing citation. So we now inject a command before calling `\@citex` that does the checking for us. It is not done in `\@citex` directly, because that command is altered by a number of packages/classes and this way it is more likely that the check survives.

```
18 \def\@citex@checkblank[#1]{%
19 \IfBlankTF {#2}{%
20 {\@citex[#1]{\space}}{%
21 {\@citex[#1]{#2}}{%
22 }%
23 }%
24 }
```

```

24 ⟨latexrelease⟩\EndIncludeInRelease
25 ⟨latexrelease⟩\IncludeInRelease{0000/00/00}%
26 ⟨latexrelease⟩ {\cite}{check for blank}%
27 ⟨latexrelease⟩
28 ⟨latexrelease⟩\DeclareRobustCommand\cite{%
29 ⟨latexrelease⟩ \@ifnextchar [{\@tempswatrue\@citex}{\@tempswafalse\@citex[]}}%
30 ⟨latexrelease⟩\let\@citex@checkblank\@undefined
31 ⟨latexrelease⟩
32 ⟨latexrelease⟩\EndIncludeInRelease
33 {*2ekernel}

```

(*End definition for \cite.*)

**\@citex** \penalty\@m added to definition of \@citex to allow a line break after the ‘,’ in citations like [Jones80,Smith77] (Added 23 Oct 86)  
space added after the ‘,’ (21 Nov 87)

```

34 \def\@citex[#1]{\leavevmode
35 \let\@citema\@empty
36 \@cite{\@for\@citemb:=#2\do
37 {\@citema\def\@citema{,\penalty\@m\ }%
38 \edef\@citemb{\expandafter\@firstofone\@citemb\@empty}%
39 \if@filesw\immediate\write\@auxout{\string\citation{\@citemb}}\fi

```

Using \hbox instead of \mbox is fine because of the \leavevmode above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arseneau. Note that this one is inside the first argument of the \@cite hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

40 \ifundefined{b@\@citemb}{\hbox{\reset@font\bfseries ?}}%
41 \G@refundefinedtrue
42 \@latex@warning
43 {Citation ‘\@citemb’ on page \thepage \space undefined}%
44 {\@cite@ofmt{\csname b@\@citemb\endcsname}}}\#1}}

```

(*End definition for \@citex.*)

```

\bibdata
\bibstyle 45 \let\bibdata=\@gobble
46 \let\bibstyle=\@gobble

```

(*End definition for \bibdata and \bibstyle.*)

```

\bibliography
47 \def\bibliography#1{%
48 \if@filesw
49 \immediate\write\@auxout{\string\bibdata{\zap@space#1 \@empty} }%
50 \fi
51 \@input{\jobname.bbl}}

```

(End definition for \bibliography.)

```
\bibliographystyle
52 \def\bibliographystyle#1{%
53 \ifx\@begindocumenthook\@undefined\else
54 \expandafter\AtBeginDocument
55 \fi
56 {\if@filesw
57 \immediate\write\auxout{\string\bibstyle{#1}}%
58 \fi}}
```

(End definition for \bibliographystyle.)

\nocite (Added 14 Jun 85)

This puts information on the .aux file that causes BIBTEX to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for \nocite like that for \@citet, to get rid of leading spaces.

```
59 </2ekernel>
60 <*2ekernel | latexrelease>
61 <| latexrelease>\IncludeInRelease{2021/06/01}%
62 <| latexrelease> {\nocite}{Allow nocite in preamble}%
63 \def\nocite#1{\@bsphack
```

With the implementation designed already in LATEX 2.09 the \nocite command will not work before \begin{document} since it tries to write to the .aux file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

[This would be easy to fix, but then a document using the fix will silently fail on an older release of LATEX, missing all citations done with \nocite. Thus we do only generate an error message and leave the fix for a LATEX 2 $\varepsilon$  successor.]

Given that we are now a quarter century into using LATEX 2 $\varepsilon$  there is no good reason any more do limit ourself to 2.09 considerations. So we now simply delay the \nocite if it is issued in the preamble.

```
64 \ifx\@onlypreamble\document
```

Since we are after \begin{document} we can do the citations:

```
65 \@for\@citeb:=#1\do{%
66 \edef\@citeb{\expandafter\@firstofone\@citeb}%
67 \if@filesw\immediate\write\auxout{\string\citation{\@citeb}}\fi
68 \@ifundefined{b@\@citeb}{\G@refundefinedtrue
69 \G@warning{Citation ‘\@citeb’ undefined}}{}%
70 }
```

But before \begin{document} we raised an error message in the past but as of 2021/05 not any longer.

```
71 \% \@latex@error{Cannot be used in preamble}\@eha
```

Instead we delay the declaration to the start of the document. We have to use a late hook for this, so that it comes after the .aux file is open for writing and after \@preamblecmds was executed to change the above test. Therefore \AtBeginDocument would still be too early.

```
72 \AddToHook{begindocument/end}[kernel]{\nocite{#1}}%
73 \fi
```

```

74 \@esphack}
75 {/2ekernel | latexrelease}
76 \latexrelease\EndIncludeInRelease
77 \latexrelease\IncludeInRelease{0000/00/00}%
78 \latexrelease{}{\nocite}{Allow nocite in preamble}%
79 \latexrelease
80 \latexrelease\def\nocite#1{\@bsphack
81 \latexrelease\ifx\onlypreamble\document
82 \latexrelease\@for\@citeb:=#1\do{%
83 \latexrelease\edef\@citeb{\expandafter\firstofone\@citeb}%
84 \latexrelease\if@filesw\immediate\write\auxout{\string\citation{\@citeb}}\fi
85 \latexrelease\@ifundefined{b@\@citeb}{\G@refundefinedtrue
86 \latexrelease\@latex@warning{Citation ‘\@citeb’ undefined}}{}%
87 \latexrelease\else
88 \latexrelease\@latex@error{Cannot be used in preamble}\@eha
89 \latexrelease\fi
90 \latexrelease\@esphack}
91 \latexrelease
92 \latexrelease\EndIncludeInRelease
93 {*2ekernel}

```

Since `\nocite{*}` should not produce a warning about undefined citation keys (see PR 557), we need to set the control sequence ‘`\b@*`’ to something other than `\relax`. As a result `\cite{*}` will not warn either (but that never worked with BibTeX in the first place).

```
94 \expandafter\let\csname b@\endcsname\empty
```

(*End definition for \nocite.*)

## 1.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

```
\@cite
95 \def\@cite#1#2{[#1\if@tempswa , #2\fi]}}

```

(*End definition for \@cite.*)

`\@cite@ofmt` This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of `b@\@citeb`; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

```
96 \let\@cite@ofmt\hbox
```

(*End definition for \@cite@ofmt.*)

```
\@biblabel
97 \def\@biblabel#1{[#1]}
98 {/2ekernel}
```

(*End definition for \@biblabel.*)

## lmarks.dtx

### Abstract

Marks are used to communicate information about the content of a page to the output routine. For example, in order to construct running headers, the output routine needs information about which section names are present on a page, and this information is passed to it through the mark system. However, marks may also be used for other purposes. This module provides a generalized mechanism for marks of independent classes.

## 1 Introduction

The *T<sub>E</sub>X* engines offer a low-level mark mechanism to communicate information about the content of the current page to the asynchronous operating output routine. It works by placing `\mark` commands into the source document. When the material for the current page is assembled in box 255, *T<sub>E</sub>X* scans for such marks and sets the commands `\topmark`, `\firstmark` and `\botmark`. The `\firstmark` receives the content of the first `\mark` seen in box 255 and `\botmark` the content of the last mark seen. The `\topmark` holds the content of the last mark seen on the previous page or more exactly the value of `\botmark` from the previous page. If there are no marks on the current page then all three are made equal to the `\botmark` from the previous page.

This mechanism works well for simple formats (such as plain *T<sub>E</sub>X*) whose output routines are only called to generate pages. It fails, however, in *L<sup>A</sup>T<sub>E</sub>X* (and other more complex formats), because here the output routine is sometimes called without producing a page, e.g., when encountering a float and placing it into one of the float regions. In that case the output routine is called, determines where to place the float, alters the goal for assembling text material (if the float was added to the top or bottom region) and then it resumes collecting textual material.

As a result the `\botmark` gets updated and so `\topmark` no longer reflects the situation at the top of the next page when that page is finally boxed.

Another problem for *L<sup>A</sup>T<sub>E</sub>X* was that it wanted to use several “independent” marks and in the early implementations of *T<sub>E</sub>X* there was only a single `\mark` command available. For that reason *L<sup>A</sup>T<sub>E</sub>X* implemented its own mark mechanism where the marks always contained two parts with their own interfaces: `\markboth` and `\markright` to set marks and `\leftmark` and `\rightmark` to retrieve them.

However, this extended mechanism (while supporting scenarios such as chapter/section marks) was far from general. The mark situation at the top of a page (i.e., `\topmark`) remained unusable and the two marks offered were not really independent of each other because `\markboth` (as the name indicates) was always setting both.

The new mechanism overcomes both issues:

- It provides arbitrarily many, fully independent named marks, that can be allocated and, from that point onwards, used.
- It offers access for each such marks to retrieve its top, first, and bottom values separately.
- Furthermore, the mechanism is augmented to give access to marks in different “regions” which may not be just full pages.

## 2 Design-level and code-level interfaces

The interfaces are mainly meant for package developers, but they are usable (with appropriate care) also in the document preamble, for example, when setting up special running headers with `fancyhdr`, etc. They are therefore available both as CamelCase commands as well as commands for use in the L3 programming layer. Both are described together below.

---

```
\NewMarkClass \NewMarkClass {<class>}
\mark_new_class:n \mark_new_class:n {<class>}
```

---

Declares a new `<class>` of marks to be tracked by L<sup>A</sup>T<sub>E</sub>X. Each `<class>` must be declared before it is used.

Mark classes can only be declared before `\begin{document}`.

---

```
\InsertMark \InsertMark {<class>} {<text>}
\mark_insert:nn \mark_insert:nn {<class>} {<text>}
```

---

Adds a mark to the current galley for the `<class>`, containing the `<text>`.

It has no effect in places in which you can't place floats, e.g., a mark inside a box or inside a footnote never shows up anywhere.

If used in vertical mode it obeys L<sup>A</sup>T<sub>E</sub>X's internal `\nobreak` switch, i.e., it does not introduce a breakpoint if used after a heading. If used in horizontal mode it doesn't handle spacing (like, for example, `\index` or `\label` does, so it should be attached to material that is typeset).

---

```
insertmark \AddToHook {insertmark} {<code>}
```

---

When marks are inserted, the mark content may need some special treatment, e.g., by default `\label`, `\index`, and `\glossary` do not expand at this time (but only later if and when the mark content is actually used). In order to allow packages to augment or alter this setup there is a public hook `insertmark` that is executed at this point. It runs in a group so local modification to commands are only applied to the `<text>` argument of `\InsertMark` or `\mark_insert:nn`.

---

```
\TopMark * \TopMark [{<region>}]{<class>}
\FirstMark * \FirstMark [{<region>}]{<class>}
\LastMark * \LastMark [{<region>}]{<class>}
\mark_use_top:nn * \mark_use_top:nn [{<region>}]{<class>}
\mark_use_first:nn * \mark_use_first:nn [{<region>}]{<class>}
\mark_use_last:nn * \mark_use_last:nn [{<region>}]{<class>}
```

---

These functions expand to the appropriate mark  $\langle text \rangle$  for the given  $\langle class \rangle$  in the specified  $\langle region \rangle$ . The default  $\langle region \rangle$  in the design-level commands is `page`. Note that with the L3 layer commands there are no optional arguments, i.e., both arguments have to be provided.

**TEXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the  $\langle text \rangle$  does not expand further when appearing in an `x`-type or `e`-type argument expansion.

The “first” and “last” marks are those seen first and last in the current region/page, respectively. The “top” mark is the last mark of the  $\langle class \rangle$  seen in an earlier region, i.e., the  $\langle text \rangle$  what would be “current” at the very top of the region.

### Important!

The commands are only meaningful inside the output routine, in other places their result is (while not random) unpredictable due to the way L<sup>A</sup>T<sub>E</sub>X cuts text material into pages.

Currently,  $\langle region \rangle$  is one of `page`, `previous-page`, `column`, and `previous-column`. If a page has just been finished then the region `page` refers to the current page and `previous-page`, as the name indicates, to the page that has been finished previously. This means you are able to access mark information for the current page as well as for the page before if you are inside the output routine, without the need to explicitly save that information beforehand.

In single column documents the `column` is the same as the `page` region, but in two-column documents, `column` refers to the current column that just got finished and `previous-column` to the one previously finished. Code for running headers are (in standard L<sup>A</sup>T<sub>E</sub>X) only evaluated when both columns are assembled, which is another way of saying that in that case `previous-column` refers to the left column and `column` to the right column. However, to make this a bit nicer to access, there are also alias regions named `first-column` and `last-column`<sup>32</sup> to access these regions.<sup>33</sup>

Note that you can only look backwards at already processed regions, e.g., in a `twoside` document finishing a recto (odd, right-hand) page you can access the data from the facing verso (left-hand) page, but if you are finishing a left-hand page you can't integrate data from the upcoming right-hand page. If such a scenario needs to be realized then it is necessary to save the left-hand page temporarily instead of finalizing it, process material for the right-hand page and once both are ready, attach running headers and footers and shipout out both in one go.<sup>34</sup>

<sup>32</sup>This is called “last” not “second” in anticipation of extending the mechanism to multiple columns, where first and last would still make sense.

<sup>33</sup>At the moment there aren't any `previous-...-column` regions to access the columns from the previous page. If necessary, the mechanism could be easily augmented to cover them too, though.

<sup>34</sup>As of now that scenario is not yet officially supported.

---

```
\IfMarksEqualTF * \IfMarksEqualTF [{<region>} {<class>} {<pos1>} {<pos2>} {<true>} {<false>}]
\mark_if_eq:nnnnTF * \mark_if_eq:nnnnTF [{<region>} {<class>} {<pos1>} {<pos2>} {<true>} {<false>}]
\mark_if_eq:nnnnnnTF * \mark_if_eq:nnnnnnTF [{<region1>} {<class1>} {<pos1>}
 {<region2>} {<class2>} {<pos2>} {<true>} {<false>}]
```

These conditionals allow you to compare the content of two marks and act based on the result. The commands work in an expansion context, if necessary.

It is quite common when programming with marks to need to interrogate conditions such as whether marks have appeared on a previous page, or if there are multiple marks present on the current page, and so on. The tests above allow for the construction of a variety of typical test scenarios, with three examples presented below.

The first two conditionals cover only the common scenarios. Both marks are picked up from the same *<region>* (by default *page*) and they have to be of the same *<class>*.<sup>35</sup> The *<pos>* argument can be either *top*, *first*, or *last*.

If you wish to compare marks across different regions or across different classes, you have to do it using the generic test only available in the L3 programming layer or do it manually, i.e., get the marks and then compare the values yourself.<sup>36</sup>

However, the basic version is enough for the following typical use cases:

**Test for at most one mark of class *myclass* on current page:** If the first and last mark in a region are the same then either there was no mark at all, or there was at most one. To test this on the current page:

```
\NewMarkClass{myclass}
\IfMarksEqualTF{myclass}{first}{last}
 { <zero or one mark> }{ <two or more marks> }
```

**Test for no mark of class *myclass* in the previous page:** If the top mark is the same as the first mark, there is no mark in the region at all. If we wanted to do this test for the previous page:

```
\IfMarksEqualTF[previous-page]{myclass}{top}{first}
 { <no marks> }{ <at least one mark> }
```

Comparing *top* and *last* would give you the same result.

**Test for zero, one, or more than one:** Combining the two tests from above you can test for zero, one or more than one mark.

```
\IfMarksEqualTF{myclass}{top}{first}
 { <no marks> }
 {\IfMarksEqualTF{myclass}{first}{last}
 { <exactly one mark> }{ <more than one mark> }}
```

If you need one of such tests more often (or if you want a separate command for it for readability), then consider defining:

```
\providetcommand\IfNoMarkTF[2][page]{\IfMarksEqualTF[#1]{#2}{first}{last}}
```

<sup>35</sup>If an undeclared mark class is used the tests return *true* (not an error).

<sup>36</sup>If two undeclared mark classes are compared the result is always *true*; if a declared and an undeclared mark class is used it is always *false*.

## 2.1 Debugging mark code

---

```
\DebugMarksOn \DebugMarksOn ... \DebugMarksOff
\DebugMarksOff
\mark_debug_on:
\mark_debug_off:
```

Commands to turn the debugging of mark code on or off. The debugging output is rather coarse and not really intended for normal use at this point in time.

## 3 Application examples

If you want to figure out if a break was taken at a specific point, e.g., whether a heading appears at the top of the page, you can do something like this:

```
\newcounter{breakcounter}
\NewMarkClass{break}
\newcommand\markedbreak[1]{\stepcounter{breakcounter}%
 \InsertMark{break}{\arabic{breakcounter}}%
 \penalty #1\relax
 \InsertMark{break}{-\arabic{breakcounter}}}
```

To test if the break was taken you can test if `\TopMark{break}` is positive (taken) or negative (not taken) or zero (there was never any marked break so far). The absolute value can be used to keep track of which break it was (with some further coding).

*to be extended with additional application examples*

## 4 Legacy L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> interface

Here we describe the interfaces that L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  offered since the early nineties and some minor extensions.

### 4.1 Legacy design-level and document-level interfaces

---

```
\markboth \markboth {<left>} {<right>}
\markright \markright {<right>}
```

L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  uses two marks which aren't fully independent. A "left" mark generated by the first argument of `\markboth` and a "right" mark generated by the second argument of `\markboth` or by the only argument of `\markright`. The command `\markboth` and `\markright` are in turn called from heading commands such as `\chaptermark` or `\sectionmark` and their behavior is controlled by the document class.

For example, in the `article` class with `twoside` in force the `\sectionmark` will issue `\markboth` with an empty second argument and `\subsectionmark` will issue `\markright`. As a result the left mark will contain chapter titles and the right mark subsection titles.

Note, however, that in one-sided documents the standard behavior is that only `\markright` is used, i.e., there will only be right-marks but no left marks!

---

```
\leftmark * \leftmark
\rightmark * \rightmark
```

---

These functions return the appropriate mark value from the current page and work as before, that is `\leftmark` will get the last (!) left mark from the page and `\rightmark` the first (!) right mark.

In other words they work reasonably well if you want to show the section title that is current when you are about to turn the page and also show the first subsection title on the current page (or the last from the previous page if there wasn't one). Other combinations can't be shown using this interface.

The commands are fully expandable, because this is how they have been always defined in L<sup>A</sup>T<sub>E</sub>X. However, this is of course only true if the content of the mark they return is itself expandable and does not contain any fragile material. Given that this can't be guaranteed for arbitrary content, a programmer using them in this way should use `\protected@edef` and *not* `\edef` to avoid bad surprises as far as this is possible, or use the new interfaces (`\TopMark`, `\FirstMark`, and `\LastMark`) which return the *(text)* in `\exp_not:n` to prevent uncontrolled expansion.

## 4.2 Legacy interface extensions

The new implementation adds three mark classes: `2e-left`, `2e-right` and `2e-right-nonempty` and patches `\markboth` and `\markright` slightly so that they also update these new mark classes, so that the new classes work with existing document classes.

As a result you can use `\LastMark{2e-left}` and `\FirstMark{2e-right}` instead of `\leftmark` and `\rightmark`. But more importantly, you can use any of the other retrieval commands to get a different status value from those marks, e.g., `\LastMark{2e-right}` would return the last subsection on the page (instead of the first as returned by `\rightmark`).

The difference between `2e-right` and `2e-right-nonempty` is that the latter will only be updated if the material for the mark is not empty. Thus `\markboth{title}{}{}` as issued by, say, `\sectionmark`, sets a `2e-left` mark with `title` and a `2e-right` mark with the empty string but does not add a `2e-right-nonempty` mark.

Thus, if you have a section at the start of a page and you would ask for `\FirstMark{2e-right}` you would get an empty string even if there are subsections on that page. But `2e-right-nonempty` would then give you the first or last subsection on that page. Of course, nothing is simple. If there are no subsections it would tell you the last subsection from an earlier page. We therefore need comparison tools, e.g., if top and first are identical you know that the value is bogus, i.e., a suitable implementation would be

```
\IfMarksEqualTF{2e-right-nonempty}{top}{first}
 { <appropriate action if there was no real mark> }
 {\FirstMark{2e-right-nonempty}}
```

## 5 Notes on the mechanism

In contrast to vanilla T<sub>E</sub>X,  $\varepsilon$ -T<sub>E</sub>X extends the mark system to allow multiple independent marks. However, it does not solve the `\topmark` problem which means that L<sup>A</sup>T<sub>E</sub>X still needs to manage marks almost independently of T<sub>E</sub>X. The reason for this is that the more complex output routine used by L<sup>A</sup>T<sub>E</sub>X to handle floats (and related structures)

means that `\topmark(s)` remain unreliable. Each time the output routine is fired up, `TEX` moves `\botmark` to `\topmark`, and while  $\varepsilon$ -`TEX` extends this to multiple registers the fundamental concept remains the same. That means that the state of marks needs to be tracked by `LATEX` itself. An early implementation of this package used `TEX`'s `\botmark` only to ensure the correct interaction with the output routine (this was before the  $\varepsilon$ -`TEX` mechanism was even available). However, other than in a prototype implementation for `LATEX3`, this package was never made public.

The new implementation now uses  $\varepsilon$ -`TEX`'s marks as they have some advantages, because with them we can leave the mark text within the galley and only extract the marks during the output routine when we are finally shipping out a page or storing away a column for use in the next page. That means we do not have to maintain a global data structure that we have to keep in sync with informational marks in the galley but can rely on everything being in one place and thus manipulations (e.g. reordering of material) will take the marks with them without a need for updating a fragile linkage.

To allow for completely independent marks we use the following procedure:

- For every type of marks we allocate a mark class so that in the output routine `TEX` can calculate for each class the current top, first, and bottom mark independently. For this we use `\newmarks`, i.e., one marks register per class.
- As already mentioned firing up an output routine without shipping out a page means that `TEX`'s top marks get wrong so it is impossible to rely on `TEX`'s approach directly. What we do instead is to keep track of the real marks (for the last page or more generally last region) in some global variables.
- These variables are updated in the output routine at defined places, i.e., when we do real output processing but not if we use special output routines to do internal housekeeping.
- The trick we use to get correctly updated variables is the following: the material that contains new marks (for example the page to be shipped out) is stored in a box. We then use `TEX` primitive box splitting functions by splitting off the largest amount possible (which should be the whole box if nothing goes really wrong). While that seems a rather pointless thing to do, it has one important side effect: `TEX` sets up first and bottom marks for each mark class from the material it has split off. This way we get the first and last marks (if there have been any) from the material in the box.
- The top marks are simply the last marks from the previous page or region. And if there hasn't been a first or bottom mark in the box then the new top mark also becomes new first and last mark for that class.
- That mark data is then stored in global token lists for use during the output routine and legacy commands such as `\leftmark` or new commands such as `\TopMark` simply access the data stored in these token lists.

That's about it in a nutshell. Of course, there are some details to be taken care of—those are discussed in the implementation sections.

## 6 Internal output routine functions

The functions in this section are tied to the output routine and used in the interface to L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> and perhaps at some later time within a new output routine for L<sup>A</sup>T<sub>E</sub>X. They are not meant for general use and are therefore made internal. Internal means that `@@` automatically gets replaced in the code (and in the documentation) so we have to give it a suitable value.

`1 <@&=mark>`

---

`\_mark_update_singlecol_structures: \_mark_update_singlecol_structures:`

L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> integration function in case we are doing single column layouts. It assumes that the page content is already stored in `\@outputbox` and processes the marks inside that box. It is called as part of `\@opcol`.

---

`\_mark_update_dblcol_structures: \_mark_update_singlecol_structures:`

L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> integration function mark used when we are doing double column documents. It assumes that the page content is already stored in `\@outputbox` and processes the marks inside that box. It then does different post-processing depending on the start of the switch `\if@firstcolumn`. If we are in the second column it also has to update page marks, otherwise it only updates column marks. It too is called as part of `\@opcol`.

---

`\_mark_update_structure:nn \_mark_update_structure:nn {\<region>} {\<material with marks>}`

Helper function that inspects the marks inside the second argument and assigns new mark values based on that to the `<region>` given in the first argument. For this it first copies the mark structure from `<region>` to `previous-<region>` and then takes all last mark values currently in the region and makes them the new top mark values. Finally it assigns new first and last values for all mark classes based on what was found in the second argument.

As a consequence, the allowed values for `<region>` are `page` and `column` because only they have `previous-...` counterparts.

Another important part to keep in mind is that marks are only recognized if they appear on top-level, e.g., if we want to process material stored in boxes we need to put it unboxed (using `\unvcopy` etc.) into the second argument.

---

`\_mark_update_structure_alias:nn \_mark_update_structure_alias:nn {\<alias>} {\<source>}`

Helper function that copies all mark values in the `<source>` region to `<alias>`, i.e., make the structures identical. Used to update the `previous-...` structures inside `\_mark_update_structure:nn` and `first-column` and `last-column` structures inside `\_mark_update_singlecol_structures:` or `\_mark_update_dblcol_structures:`.

---

`\_mark_update_structure_to_err:n \_mark_update_structure_to_err:n {\<region>}`

Helper function that sets all mark values in the `<region>` to an error message. This is currently used for `last-column` at times where using marks from it would be questionable/wrong, i.e., when we have just processed the first column in a two-column document.

## 7 The Implementation

```
2 {*2ekernel | latexrelease}
3 \ExplSyntaxOn
4 <texreleas>\NewModuleRelease{2022/06/01}{ltmarks}
5 <texreleas> {Marks~handling}
```

### 7.1 Allocating new mark classes

---

`\g_mark_classes_seq` A list holding all the mark classes that have been declared.

```
6 \seq_new:N \g_mark_classes_seq
```

`\mark_new_class:n` A mark class is created by initializing a number of data structures. First, we get a register number to refer to the mark class. The new mark class is then added to the `\g_mark_classes_seq` sequence to be able to easily loop over all classes. Finally a number of top-level global token lists are declared that hold various versions of the mark for access.

```
7 \cs_new_protected:Npn \mark_new_class:n #1
8 {
9 \seq_if_in:NnTF \g_mark_classes_seq {#1}
10 {
11 \msg_error:nnn { mark } { class-already-defined }
12 {#1}
13 }
14 { __mark_new_class:nn {#1} }
15 }
```

This is only available in the preamble.

```
16 \onlypreamble \mark_new_class:n
```

The internal command carries out the necessary allocations.

```
17 \cs_new_protected:Npn __mark_new_class:nn #1
18 {
19 (*trace)
20 __mark_debug:n { \iow_term:x { Marks:-new-mark:-#1-\msg_line_context: } }
21 (/trace)}
```

Use the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  interface for now as the L3 programming layer doesn't have one for marks yet.

```
22 \exp_args:Nc \newmarks {c_mark_class_ #1 _mark}
```

Remember the new class in the sequence.

```
23 \seq_gput_right:Nn \g_mark_classes_seq {#1}
```

We need three token lists for each region, one for top, first, and last.

```
24 \tl_new:c { g_mark_page_top_ #1 _tl }
25 \tl_new:c { g_mark_page_first_ #1 _tl }
26 \tl_new:c { g_mark_page_last_ #1 _tl }
```

For the page region we also keep track of the previous-page.

```
27 \tl_new:c { g_mark_previous-page_top_ #1 _tl }
28 \tl_new:c { g_mark_previous-page_first_ #1 _tl }
29 \tl_new:c { g_mark_previous-page_last_ #1 _tl }
```

Same game for `column` and `previous-column`

```
30 \tl_new:c { g__mark_column_top_ #1 _tl }
31 \tl_new:c { g__mark_column_first_ #1 _tl }
32 \tl_new:c { g__mark_column_last_ #1 _tl }
33 \tl_new:c { g__mark_previous-column_top_ #1 _tl }
34 \tl_new:c { g__mark_previous-column_first_ #1 _tl }
35 \tl_new:c { g__mark_previous-column_last_ #1 _tl }
```

But for columns we also allocate token lists for the alias regions `first-column` and `last-column`.

```
36 \tl_new:c { g__mark_first-column_top_ #1 _tl }
37 \tl_new:c { g__mark_first-column_first_ #1 _tl }
38 \tl_new:c { g__mark_first-column_last_ #1 _tl }
39 \tl_new:c { g__mark_last-column_top_ #1 _tl }
40 \tl_new:c { g__mark_last-column_first_ #1 _tl }
41 \tl_new:c { g__mark_last-column_last_ #1 _tl }
42 }
```

(End definition for `\mark_new_class:n` and `\_mark_new_class:nn`. This function is documented on page 793.)

## 7.2 Updating mark structures

For some operations we need a temporary private box and two private global token lists.

```
43 \box_new:N \l__mark_box
44 \tl_new:N \g__mark_tmp_tl
45 \tl_new:N \g__mark_new_top_tl
```

(End definition for `\l__mark_box`, `\g__mark_tmp_tl`, and `\g__mark_new_top_tl`.)

This function updates the mark structures. The first argument is the region to update and second argument receives the material that holds the marks. Out of this material we extract the first and last marks for all classes (if there are any) to do the assignments.

```
46 \cs_new_protected:Npn __mark_update_structure:nn #1#2
47 {
```

First thing we do is copying the current structure to `previous-...`; this leaves the current structure untouched so we can update it class by class (which is necessary).

```
48 __mark_update_structure_alias:nn { previous-#1 } {#1}
```

Getting the first and last marks out of the material in `#2` is done by putting the material in a box and then doing a split operation to the maximum size possible (which hopefully means all of the content).<sup>37</sup> Because this is an action only for the sake of getting at the mark values we don't want any underfull box warnings so we turn those (locally) off.

```
49 \group_begin:
50 \dim_set_eq:NN \tex_splitmaxdepth:D \c_max_dim
51 \int_set_eq:NN \tex_vbadness:D \c_max_int
52 \dim_set_eq:NN \tex_vfuzz:D \c_max_dim
```

---

<sup>37</sup>We could verify this, maybe we should.

There is a further complication: if the region contains infinite shrinking glue then a `\vsplit` operation will balk with a low-level error. Now pages or columns, which are our main concern here, can't have such infinite shrinkage if they are cut straight from the galley, however the use of `\enlargethispage` actually does add some at the very bottom (and also wraps the whole page into a box by itself, so if we leave it this way then a) we get this error and b) we don't see any marks because they are hidden one level down).

Another possible issue are packages or user code that place stray `\vboxes` directly into the main galley (an example is `marginnote` that attaches its marginals in this way). If such boxes end up as the last item on the page we should not unpack them.

We therefore do an `\unskip` to get rid of that glue if present and also check if we have then a `\vbox` as the last item and if so unpack that too, but only under certain conditions, see below. All this is temporary, just for getting the marks out, so it doesn't affect the final page production.

In fact, we go one step further and set the box to a large negative height possible and afterwards take a look at the reported badness: if it is zero we know that there has still been infinite shrinkage in the box so that we can't do a `\vsplit`. If that is the case we generate an error message and bypass extracting the marks. We use only half of `\c_max_dim` because otherwise TeX will report an overfull vbox despite our setting of `\tex_vfuzz:D`. This test will not find existing infinite shrinkage in all cases, e.g., if there are several glues that cancel each other, but it is the best we can do.

```

53 \vbox_set_to_ht:Nnn \l_mark_box { -.5\c_max_dim }
54 {
55 #2
56 \tex_unskip:D
57 \box_set_to_last:N \l_mark_box

```

After having removed the last box from the current list (if there was one) we check if the list is now empty. If not, the the last box is definitely not the one from `\enlargethispage` and so we can and should leave it alone. Otherwise we check if this last box is a `\vbox`.

```

58 \int_compare:nNnT \tex_lastnodetype:D < 0
59 {
60 \box_if_vertical:NT \l_mark_box
61 {

```

If it is we do a further test and reset the `\l_mark_box` to check if it contains infinitely shrinkable glue.

```

62 \vbox_set_to_ht:Nnn \l_mark_box { -.5\c_max_dim }
63 {
64 \vbox_unpack:N \l_mark_box
65 \tex_kern:D \c_zero_dim % ensure that box
66 % is not empty
67 }

```

If not, then we unpack it, if yes we still ignore it for the process of mark extraction. We do not generate an error though, because in all likelihood this is an ordinary box like a marginal that does contain something like `\vss`.

```

68 \int_compare:nNnT \tex_badness:D > 0
69 {
70 \vbox_unpack:N \l_mark_box
71 }

```

If it wasn't a vbox, it was either an hbox or there was no box. Given that we are only interested in the marks we don't need put it back in that case. However, we have to

make sure that the outer box under construction is not totally empty (which it might have been from the start, or now), because TeX does not report a badness for empty boxes and that means our test would incorrectly conclude that we have infinite shrinking glue. A simple `\kern` is enough to avoid this (the same was already done above).

```

72 \tex_kern:D \c_zero_dim
73 }
74 \int_compare:nNnTF \tex_badness:D > 0

```

If the box had no infinite shrinkage (or rather if our test didn't show any) we vsplit it. Note that it doesn't matter that we set it to this strange size first. If there was infinite shrinkage after all, we end up with a low-level TeX error, but if there is, it is a coding error and needs correcting.

```

75 {
76 \vbox_set_split_to_ht:Nn \l_mark_box \l_mark_box \c_max_dim

```

After this action we can get first and last marks of the various classes through `\tex_splitfirstmarks:D` and `\tex_splitbotmarks:D`. So now we loop over all classes stored in `\g_mark_classes_seq`.

```

77 \seq_map_inline:Nn \g_mark_classes_seq
78 {

```

First action: get the last mark from the previous region, i.e., `previous-#1`. But because it is also still inside `#1`, at the moment we use that to construct the name because this is a tiny bit faster. Given that we need this value in various assignments we store it away which avoids unnecessary further csname generations.

```
 79 \tl_gset_eq:Nc \g_mark_new_top_tl { g_mark_#1_last_##1_tl }
```

This will first of all become the new top mark for the current class.

```
 80 \tl_gset_eq:cN { g_mark_#1_top_##1_tl } \g_mark_new_top_tl
```

Next action is to get ourselves the new last mark from the material supplied.

```

81 \tl_gset:Nn \g_mark_tmp_tl
82 { \tex_splitbotmarks:D \use:c { c_mark_class_##1_mark } }

```

If this mark doesn't exist then obviously first mark does neither, so both become the last mark from the previous region. We have to be a little careful here: something like `\mark_insert:nn{foo}{}{}` adds an “empty” mark that should not be confused with no mark at all. But no mark in our material will result in `\g_mark_tmp_tl` being fully empty. This is why we have to make sure that “empty” from `\mark_insert:nn` only appears to be empty but fails the next test (see below how this is done).

```

83 \tl_if_empty:NTF \g_mark_tmp_tl
84 {
85 \tl_gset_eq:cN { g_mark_#1_last_ ##1_tl }
86 \g_mark_new_top_tl
87 \tl_gset_eq:cN { g_mark_#1_first_##1_tl }
88 \g_mark_new_top_tl
89 }

```

If it wasn't empty, i.e., if it had a real value then we use this value for our new last mark instead.

```

90 {
91 \tl_gset_eq:cN { g_mark_#1_last_##1_tl } \g_mark_tmp_tl

```

Because we had a last mark we also have a first mark (which might be the same, but might be not), so we pick that up and assign it to the appropriate token list. This explains why we first checked for the last mark because that makes the processing faster in case there is none.

```

92 \tl_gset:co { g__mark_##1_first_##1_tl }
93 {
94 \tex_splitfirstmarks:D
95 \use:c { c__mark_class_##1_mark }
96 }
97 }
98 }
99 }
```

If the badness was zero (we actually tested for  $> 0$  but it can't get negative) then we had infinite shrinkage, so we report that and set all marks to the value the last mark had before.

```

100 {
101 \msg_error:nnn { mark } { infinite-shrinkage } {#1}
102 \seq_map_inline:Nn \g__mark_classes_seq
103 {
104 \tl_gset_eq:cc { g__mark_##1_top_ ##1_tl }
105 { g__mark_##1_last_ ##1_tl }
106 \tl_gset_eq:cc { g__mark_##1_first_##1_tl }
107 { g__mark_##1_last_ ##1_tl }
108 }
109 }
```

Once all mark classes have been processed the data structures are updated and we can close the group which undoes our local changes and retains only the global ones.

```

110 \group_end:
111 }
```

*(End definition for \\_\_mark\_update\_structure:nn.)*

#### \\_\_mark\_update\_structure\_alias:nn

This function copies the structure for one region to another (name), e.g., from `page` to `previous-page` above, or later from `column` to `first-column`, etc.

```

112 \cs_new_protected:Npn __mark_update_structure_alias:nn #1#2 {
```

This requires a simple loop through all mark classes copying the token list from one name to the next.

```

113 \seq_map_inline:Nn \g__mark_classes_seq
114 {
115 \tl_gset_eq:cc { g__mark_ #1_top_ ##1_tl }
116 { g__mark_ #2_top_ ##1_tl }
117 \tl_gset_eq:cc { g__mark_ #1_first_ ##1_tl }
118 { g__mark_ #2_first_ ##1_tl }
119 \tl_gset_eq:cc { g__mark_ #1_last_ ##1_tl }
120 { g__mark_ #2_last_ ##1_tl }
121 }
122 }
```

*(End definition for \\_\_mark\_update\_structure\_alias:nn.)*

```

__mark_update_structure_to_err:n A slight variation is to install a fixed error message as the value.
__mark_error:n
123 \cs_new_protected:Npn __mark_update_structure_to_err:n #1 {
124 \seq_map_inline:Nn \g__mark_classes_seq
125 {
126 \tl_gset:cn { g__mark_ #1 _top_ ##1 _tl } { __mark_error:n {#1} }
127 \tl_gset:cn { g__mark_ #1 _first_ ##1 _tl } { __mark_error:n {#1} }
128 \tl_gset:cn { g__mark_ #1 _last_ ##1 _tl } { __mark_error:n {#1} }
129 }
130 }

```

Given that this is used in only one place, we could hardwire the argument which would be a bit more compact, but who knows, perhaps we end up with another reason to use this error command elsewhere, so for now we keep the argument.

```

131 \cs_new_protected:Npn __mark_error:n #1 {
132 \msg_error:nnn { mark } { invalid-use } {#1}
133 }

```

(End definition for `\__mark_update_structure_to_err:n` and `\__mark_error:n`.)

### 7.3 Placing and retrieving marks

`\mark_insert:nn` This function puts a mark for some  $\langle class \rangle$  at the current point.

```

134 \cs_new_protected:Npn \mark_insert:nn #1#2
135 {
136 \seq_if_in:NnTF \g__mark_classes_seq {#1}
137 {

```

We need to pass the evaluated argument into the mark but protected commands should not expand including those protected using the `\protect` approach of L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub>. We also disable `\label` and the like.<sup>38</sup>

At this point the code eventually should get a public (and a kernel) hook instead of a set of hardwired settings.

```
138 \group_begin:
```

Within the group we alter some comments, e.g., `\label` or `\index`, to do the right at this point. This is done in the kernel hook `\@kernel@before@insertmark` which is followed by the public hook `insertmark` that can be used by packages to augment or alter that setup as necessary.

```

139 \@kernel@before@insertmark
140 \hook_use:n { insertmark }
141 \unrestored@protected@xdef \g__mark_tmp_tl {#2}
142 (*trace)
143 __mark_debug:n{ \iow_term:x { Marks:~ set~#1~-<-
144 '\tl_to_str:V \g__mark_tmp_tl' ~ \msg_line_context: } }
145 (/trace)
146 \tex_marks:D \use:c { c__mark_class_ #1 _mark }
147 {

```

Here is the trick to avoid truly empty marks: if the result from the above processing is empty we add something which eventually becomes empty, but not immediately; otherwise we just put `\g__mark_tmp_tl` in.

```
148 \tl_if_empty:NTF \g__mark_tmp_tl
```

---

<sup>38</sup>Straight copy from `latex.ltx` but is this even correct? At least a label in a running header makes little sense if it gets set several times! Maybe that needs looking at in the 2e kernel.

```

149 { \exp_not:n { \prg_do_nothing: } }
150 { \exp_not:o { \g__mark_tmp_tl } }
151 }
152 \group_end:

```

A mark introduces a possible break point and in certain situations that should not happen in vertical mode in L<sup>A</sup>T<sub>E</sub>X. This needs some cleanup . . .

```

153 \if@nobreak\ifvmode\nobreak\fi\fi
154 }

```

If the mark class was not known, raise an error.

```

155 {
156 \msg_error:nnx { mark } { unknown-class }
157 { \tl_to_str:n {#1} }
158 }
159 }

```

(End definition for `\mark_insert:nn`. This function is documented on page 793.)

`\@kernel@before@insertmark` By default `\label`, `\index`, and `\glossary` do nothing when the mark is inserted.

```

insertmark
160 \cs_new:Npn \@kernel@before@insertmark {
161 \cs_set_eq:NN \label \scan_stop:
162 \cs_set_eq:NN \index \scan_stop:
163 \cs_set_eq:NN \glossary \scan_stop:
164 }

```

The public hook to augment the setup.

```
165 \hook_new:n {insertmark}
```

(End definition for `\@kernel@before@insertmark` and `insertmark`.)

`\mark_use_top:nn`  
`\mark_use_first:nn`  
`\mark_use_last:nn`

To retrieve the first, last or top region mark, we grab the appropriate value stored in the corresponding token list variable and pass its contents back. These functions should be used only in output routines after `\__mark_update_structure:nn` has acted, otherwise their value will be wrong.

If used with an unknown class or region they generate an error (fairly low-level because we are in an expandable context).

```

166 \cs_new:Npn \mark_use_first:nn #1#2 { \exp_not:v { \g__mark_#1_first_#2_tl } }
167 \cs_new:Npn \mark_use_last:nn #1#2 { \exp_not:v { \g__mark_#1_last_#2_tl } }
168 \cs_new:Npn \mark_use_top:nn #1#2 { \exp_not:v { \g__mark_#1_top_#2_tl } }

```

(End definition for `\mark_use_top:nn`, `\mark_use_first:nn`, and `\mark_use_last:nn`. These functions are documented on page 794.)

## 7.4 Comparing mark values

`\mark_if_eq:nnnnTF` Test if in a given region (#1) for a given class (#2) the marks in position #3 and #4 (top, first, or last) are identical  
`\mark_if_eq:nnnnnnTF`

```

169 \prg_new_conditional:Npnn \mark_if_eq:nnnn #1#2#3#4 { T , F , TF }
170 {
171 \tl_if_eq:ccTF { \g__mark_#1_#3_#2_tl }
172 { \g__mark_#1_#4_#2_tl }
173 \prg_return_true:
174 \prg_return_false:
175 }

```

The fully general test (with two triplets of the form  $\langle region \rangle$ ,  $\langle class \rangle$ , and  $\langle position \rangle$ ) is this:

```

176 \prg_new_conditional:Npnn \mark_if_eq:nnnnnn #1#2#3#4#5#6 { T , F , TF }
177 {
178 \tl_if_eq:ccTF { g__mark_ #1 _#3_ #2 _tl }
179 { g__mark_ #4 _#6_ #5 _tl }
180 \prg_return_true:
181 \prg_return_false:
182 }
```

(End definition for  $\text{\mark_if_eq:nnnnTF}$  and  $\text{\mark_if_eq:nnnnnnTF}$ . These functions are documented on page 795.)

## 7.5 Messages

Mark errors are LaTeX kernel errors:

```

183 \prop_gput:Nnn \g_msg_module_type_prop { mark } { LaTeX }
184 \msg_new:nnn { mark } { class-already-defined }
185 { Mark~class~'#1'~already~defined }
186 {

211 The~mark~region~'#1'~contains~some~infinite~negative~glue~
212 allowing~it~to~shrink~to~an~arbitrary~size.~
213 This~makes~it~impossible~to~split~the~region~apart~to~
214 get~at~its~marks.~They~are~lost.
215 }

216 }
```

## 7.6 Debugging the mark structures

Code and commands in this section are not final, it needs more experimentation to see what kind of tracing information is going to be useful in practice. For now the tracing is mainly meant to be used for code testing and not so much for application testing.

It is quite likely that the commands and the behavior of the tracing might change in the future once we gained some experience with it.

\g\_mark\_debug\_bool Holds the current debugging state.

```
217 \bool_new:N \g_mark_debug_bool
```

(End definition for \g\_mark\_debug\_bool.)

\mark\_debug\_on: Turns debugging on and off by redefining \\_\_mark\_debug:n.

\mark\_debug\_off:

\\_\_mark\_debug:n \cs\_new\_eq:NN \\_\_mark\_debug:n \use\_none:n

```
219 \cs_new_protected:Npn \mark_debug_on:
```

\\_\_mark\_debug\_gset:

```
220 {
```

```
221 \bool_gset_true:N \g_mark_debug_bool
```

```
222 __mark_debug_gset:
```

```
223 }
```

```
224 \cs_new_protected:Npn \mark_debug_off:
```

```
225 {
```

```
226 \bool_gset_false:N \g_mark_debug_bool
```

```
227 __mark_debug_gset:
```

```
228 }
```

```
229 \cs_new_protected:Npn __mark_debug_gset:
```

```
230 {
```

```
231 \cs_gset_protected:Npx __mark_debug:n ##1
```

```
232 { \bool_if:NT \g_mark_debug_bool {##1} }
```

```
233 }
```

(End definition for \mark\_debug\_on: and others. These functions are documented on page 796.)

\DebugMarksOn CamelCase commands for debugging.

\DebugMarksOff

\cs\_new\_eq:NN \DebugMarksOn \mark\_debug\_on:

\cs\_new\_eq:NN \DebugMarksOff \mark\_debug\_off:

(End definition for \DebugMarksOn and \DebugMarksOff. These functions are documented on page 796.)

\\_\_mark\_class\_status:nn Shows the mark values across all regions for one mark class (#2). The first argument gives some ⟨info⟩ to help identifying where the command was called.

```
236 <*trace>
```

```
237 \cs_new_protected:Npn __mark_class_status:nn #1#2
```

```
238 {
```

```
239 \typeout{\ Marks:#2~ #1:}
```

```
240 \typeout{@spaces page~ (current):
```

```
241 | \exp_not:v { g_mark_page_top_ #2 _tl }
```

```
242 | \exp_not:v { g_mark_page_first_ #2 _tl }
```

```
243 | \exp_not:v { g_mark_page_last_ #2 _tl } |}
```

```
244 \typeout{@spaces page~ (previous):
```

```
245 | \exp_not:v { g_mark_previous-page_top_ #2 _tl }
```

```
246 | \exp_not:v { g_mark_previous-page_first_ #2 _tl }
```

```
247 | \exp_not:v { g_mark_previous-page_last_ #2 _tl } |}
```

```
248 \typeout{@spaces column~ (previous):
```

```

249 | \exp_not:v { g__mark_previous-column_top_ #2 _tl } |
250 | \exp_not:v { g__mark_previous-column_first_ #2 _tl } |
251 | \exp_not:v { g__mark_previous-column_last_ #2 _tl } |}
252 \typeout{\@spaces column~ (current):
253 | \exp_not:v { g__mark_column_top_ #2 _tl } |
254 | \exp_not:v { g__mark_column_first_ #2 _tl } |
255 | \exp_not:v { g__mark_column_last_ #2 _tl } |}
256 \typeout{\@spaces column~ (first):
257 | \exp_not:v { g__mark_first-column_top_ #2 _tl } |
258 | \exp_not:v { g__mark_first-column_first_ #2 _tl } |
259 | \exp_not:v { g__mark_first-column_last_ #2 _tl } |}
260 \typeout{\@spaces column~ (second):
261 | \exp_not:v { g__mark_last-column_top_ #2 _tl } |
262 | \exp_not:v { g__mark_last-column_first_ #2 _tl } |
263 | \exp_not:v { g__mark_last-column_last_ #2 _tl } |}
264 }

```

(End definition for `\__mark_class_status:nn`.)

`\__mark_status:n` Show all mark class values across all regions.

```

265 \cs_new_protected:Npn __mark_status:n #1
266 {
267 \seq_map_inline:Nn \g__mark_classes_seq
268 { __mark_class_status:nn {#1} {##1} }
269 }
270
```

(End definition for `\__mark_status:n`.)

## 7.7 Designer-level interfaces

`\NewMarkClass` These two are identical to the L3 programming layer commands.

```

271 \cs_new_eq:NN \NewMarkClass \mark_new_class:n
272 \onlypreamble \NewMarkClass
273 \cs_new_eq:NN \InsertMark \mark_insert:nn

```

(End definition for `\NewMarkClass` and `\InsertMark`. These functions are documented on page 793.)

`\TopMark` The following commands take an optional argument that defaults to page. There is no checking that the region is actually valid. If not there is simply an empty return.

```

274 \NewExpandableDocumentCommand \FirstMark { O{page} m }
275 { \mark_use_first:nn {#1}{#2} }
276 \NewExpandableDocumentCommand \LastMark { O{page} m }
277 { \mark_use_last:nn {#1}{#2} }
278 \NewExpandableDocumentCommand \TopMark { O{page} m }
279 { \mark_use_top:nn {#1}{#2} }

```

(End definition for `\TopMark`, `\FirstMark`, and `\LastMark`. These functions are documented on page 794.)

\IfMarksEqualTF We only provide a CamelCase command for the case with one region (optional) and one class. One could think of also providing a version for the general case with several optional arguments, but use cases for this are most likely rare, so not done yet.

```
280 \NewExpandableDocumentCommand \IfMarksEqualTF {0{page}mmm} {
281 \mark_if_eq:nnnTF {#1}{#2}{#3}{#4}
282 }
```

(End definition for \IfMarksEqualTF. This function is documented on page 795.)

## 8 L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\epsilon$</sub> integration

### 8.1 Core L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\epsilon$</sub> integration

\\_mark\_update\_singlecol\_structures: This command updates the mark structures if we are producing a single column document.

```
283 \cs_new_protected:Npn _mark_update_singlecol_structures: {
```

First we update the page region (which also updates the previous-page).

The \outputbox is normally in \vbox in L<sup>A</sup>T<sub>E</sub>X but we can't take that for granted (an amsmath test document changed it to an \hbox just to trip me up) so we are a little careful with unpack now.

```
284 \box_if_vertical:NTF \outputbox
285 {
286 _mark_update_structure:nn {page}
287 { \vbox_unpack:N \outputbox }
288 }
289 {
290 _mark_update_structure:nn {page}
291 { \hbox_unpack:N \outputbox }
292 }
```

The we provide the necessary updates for the aliases.

```
293 _mark_update_structure_alias:nn {previous-column}{previous-page}
294 _mark_update_structure_alias:nn {column}{page}
295 _mark_update_structure_alias:nn {first-column}{page}
296 _mark_update_structure_alias:nn {last-column}{page}
297 (*trace)
298 % move this into status itself?
299 _mark_debug:n
300 {
301 _mark_status:n
302 { in~ OR~ (
303 \legacy_if:nTF {@twoside}
304 { twoside-
305 \int_if_odd:nTF \c@page
306 { odd }{ even }
307 }
308 { oneside }
309)
310 }
311 }
312 (*/trace)
313 }
```

(End definition for `\_mark_update_singlecol_structures`.)

`\_mark_update_dblcol_structures`: This command handles the updates if we are doing two-column pages.

314   `\cs_new_protected:Npn \_mark_update_dblcol_structures: {`

First we update the `column` and `previous-column` regions using the material assembled in `\@outputbox`.

```
315 \box_if_vertical:NTF \@outputbox
316 {
317 _mark_update_structure:nn {column}
318 { \vbox_unpack:N \@outputbox }
319 }
320 {
321 _mark_update_structure:nn {column}
322 { \hbox_unpack:N \@outputbox }
323 }
```

How we have to update the alias regions depends on whether or not `\copcol` was called to process the first column or to produce the completed page

```
324 \legacy_if:nTF {@firstcolumn}
325 {
```

If we are processing the first column then `column` is our `first-column` and there is no `last-column` yet, so we make those an error.

```
326 _mark_update_structure_alias:nn {first-column}{column}
327 _mark_update_structure_to_err:n {last-column}
328 }
329 {
```

If we produce the completed page then the `first-column` is the same as the new `previous-column`. However, the structure should already be correct if you think about it (because it was set to `column` last time which is now the `previous-column`), thus there is no need to make an update.

```
330 % _mark_update_structure_alias:nn {first-column}{previous-column}
```

However, we now have a proper `last-column` so we assign that.

```
331 _mark_update_structure_alias:nn {last-column}{column}
```

What now remains doing is to update the `page` and `previous-page` regions. For this we have to copy the settings in `page` into `previous-page` and then update `page` such that the top and first marks are taken from the `first-column` region and the last marks are taken from the `last-column` region. All this has to be done for all mark classes so we loop over our sequence.

Note that one loop is needed if we arrange the copy statements in a suitable way.

```
332 \seq_map_inline:Nn \g_mark_classes_seq
333 {
334 \tl_gset_eq:cc { g__mark_previous-page_top_ ##1 _tl }
335 { g__mark_page_top_ ##1 _tl }
336 \tl_gset_eq:cc { g__mark_previous-page_first_ ##1 _tl }
337 { g__mark_page_first_ ##1 _tl }
338 \tl_gset_eq:cc { g__mark_previous-page_last_ ##1 _tl }
339 { g__mark_page_last_ ##1 _tl }
```

The `page` updates need to come after the corresponding updates for `previous-page` otherwise we loose the necessary value.

```

340 \tl_gset_eq:cc { g__mark_page_top_ ##1 _tl }
341 { g__mark_first-column_top_ ##1 _tl }
342 \tl_gset_eq:cc { g__mark_page_first_ ##1 _tl }
343 { g__mark_first-column_first_ ##1 _tl }
344 \tl_gset_eq:cc { g__mark_page_last_ ##1 _tl }
345 { g__mark_last-column_last_ ##1 _tl }
346 }
347 }
348 {*trace}
349 __mark_debug:n
350 {
351 __mark_status:n
352 { in~ OR~ (
353 \legacy_if:nTF {@twoside}
354 { twoside-
355 \int_if_odd:nTF \c@page
356 { odd }{ even }
357 }
358 { oneside }
359 \space
360 \legacy_if:nTF {@firstcolumn}
361 { first~ }{ second~ }
362 column)
363 }
364 }
365 (/trace)
366 }
```

*(End definition for \\_\_mark\_update dblcol\_structures:.)*

## 8.2 Other L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\epsilon$</sub> output routines

This section will cover `multicol` and other packages altering or providing their own output routine. Not done yet.

```

372 \if@latexrelease \IncludeInRelease{0000/00/00}{ltmarks}%
373 \else
374 \fi
```

We keep the interface commands around even if we roll back in case they are used in packages that don't roll back. Not likely to do a lot of good, but then there is not much we can do, but this at least then doesn't give errors.

```
375 〈\latexrelease〉\DeclareRobustCommand \NewMarkClass[1]{}
376 〈\latexrelease〉\DeclareRobustCommand \InsertMark[2]{}
377 〈\latexrelease〉\RenewExpandableDocumentCommand \FirstMark { O{} m } { }
378 〈\latexrelease〉\RenewExpandableDocumentCommand \LastMark { O{} m } { }
379 〈\latexrelease〉\RenewExpandableDocumentCommand \TopMark { O{} m } { }
380 〈\latexrelease〉\RenewExpandableDocumentCommand \IfMarksEqualTF { O{} mmm }{ }
381 〈\latexrelease〉
```

Same here, this avoided extra roll back code in the OR.

```

## ltpage.dtx

### 1 Page styles and related commands

#### 1.1 Page Style Commands

\pagestyle{\{style\}} : sets the page style of the current and succeeding pages to *style*  
\thispagestyle{\{style\}} : sets the page style of the current page only to *style*.  
To define a page style *style*, you must define \ps@*style* to set the page style parameters.

#### 1.2 How a page style makes running heads and feet

The \ps@... command defines the macros \oddhead, \oddfoot, \evenhead, and \evenfoot to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, etc., where \chaptermark{\{text\}} is called by \chapter to set a mark. The \...mark commands and the \...head macros are defined with the help of the following macros.

(All the \...mark commands should be initialized to no-ops.)

#### 1.3 marking conventions

LATEX extends TEX's \mark facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

\markboth{\{left\}}{\{right\}} : Adds both marks.

\markright{\{right\}} : Adds a 'right' mark.

\leftmark : Used in the output routine, gets the current 'left' mark. Works like TEX's \botmark.

\rightmark : Used in the output routine, gets the current 'right' mark. Works like TEX's \firstmark. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a \chapter command and the right mark is changed by a \section command. However, it does produce somewhat anomalous results if 2 \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \cmkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \gobbletwo to do nothing.

1 <\*2ekernel>

\pagestyle User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3 \ifundefined{ps@#1}%
4 \undefinedpagestyle
5 {\@nameuse{ps@#1}}}
```

(End definition for \pagestyle.)

\thispagestyle User command to set the page style for this page only.

```
6 \def\thispagestyle#1{%
7 \ifundefined{ps@#1}%
8 \undefinedpagestyle
9 {\global\@specialpagetrue\gdef\@specialstyle{#1}}}
```

(End definition for \thispagestyle.)

\ps@empty The empty page style: No head or foot line.

```
10 \def\ps@empty{%
11 \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12 \let\@evenhead\@empty\let\@evenfoot\@empty}
```

(End definition for \ps@empty.)

\ps@plain The plain page style: No head, centred page number in foot.

```
13 \def\ps@plain{\let\@mkboth\@gobbletwo
14 \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15 \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
```

(End definition for \ps@plain.)

\@leftmark \rightmark We implement \@leftmark and \@rightmark in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.

```
16 \let\@leftmark\@firstoftwo
17 \let\@rightmark\@secondoftwo
```

(End definition for \@leftmark and \@rightmark.)

```
18 {/2ekernel}
19 {*2ekernel | latexrelease}
20 {latexrelease}\IncludeInRelease{2022/06/01}%
21 {latexrelease} {\markboth}{New mark support}%
```

\markboth User commands for setting L<sup>A</sup>T<sub>E</sub>X marks.

\markright Test for \nobreak added 15 Apr 86 in \markboth and \markright letting \label and \index to \relax added 22 Feb 86 so these commands can appear in sectioning command arguments RmS 91/06/21 Same for \glossary

```
22 \ExplSyntaxOn
23 \DeclareRobustCommand*\markboth[2]{%
24 \begingroup
25 \let\label\relax \let\index\relax \let\glossary\relax
26 \unrestored@protected\xdef\@themark {{\#1}{\#2}}%
27 \temptokena\expandafter{\@themark}}
```

In addition to generating the legacy mark we output the individual ones as well at the very same point. The legacy mark is kept unchanged in order to work with packages that expect that mark in exactly the way it is right now.

We might want to think about how to improve this in one-side documents, see comments below.

We have not changed all of the code to L3 prog layer convention, in case packages attempt to do some patching and expect the 2e names being around. Eventually this should and will change.

```
28 \mark_insert:nn{2e-left}{\#1}
29 \mark_insert:nn{2e-right}{\#2}
```

```

30 \tl_if_empty:nF{#2}{ \mark_insert:nn{2e-right-nonempty}{#2} }
31 \mark{\the\@temptokena}%
32 \endgroup
33 \if@nobreak\ifvmode\nobreak\fi\fi}

34 \DeclareRobustCommand*\markright[1]{%
35 \begingroup
36 \let\label\relax \let\index\relax \let\glossary\relax

```

Protection is handled inside \markright.

```

37 \expandafter\markright\@themark {#1}%
38 \@temptokena \expandafter{\@themark}%

```

Same game with \markright more or less ...

```

39 \mark_insert:nn{2e-right}{#1}
40 \tl_if_empty:nF{#1}{ \mark_insert:nn{2e-right-nonempty}{#1} }

```

The legacy L<sup>A</sup>T<sub>E</sub>X mechanism always sets left and right mark, i.e., if a sub-mark (i.e., right mark) is set the corresponding main mark also is getting a mark with the same value it had previously. However, for the individual mark classes this means we are losing information so for them that is not done.

```

41 % \mark_insert:nn{2e-left}{\exp_after:wN \use_i:nn \@themark }
42 \mark{\the\@temptokena}%
43 \endgroup
44 \if@nobreak\ifvmode\nobreak\fi\fi}
45 \ExplSyntaxOff

```

(End definition for \markboth and \markright. These functions are documented on page 796.)

```

# File U

## ltclass.dtx

### 1 Introduction

This file implements the following declarations, which replace `\documentstyle` in L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> and L<sup>A</sup>T<sub>E</sub>X 2.09 is that L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

### 2 User interface

`\documentclass[⟨main-option-list⟩]{⟨class⟩}[⟨version⟩]`

There must be exactly one such declaration, and it must come first. The *⟨main-option-list⟩* is a list of options which can modify the formatting of elements which are defined in the *⟨class⟩* file as well as in all following `\usepackage` declarations (see below). The *⟨version⟩* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

`\documentstyle[⟨main-option-list⟩]{⟨class⟩}[⟨version⟩]`

The `\documentstyle` declaration is kept in order to maintain upward compatibility with L<sup>A</sup>T<sub>E</sub>X 2.09 documents. It is similar to `\documentclass`, but it causes all options in *⟨main-option-list⟩* that the *⟨class⟩* does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in L<sup>A</sup>T<sub>E</sub>X 2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors L<sup>A</sup>T<sub>E</sub>X generates. This flag does affect the definition of font commands, and `\sloppy`.

`\usepackage[⟨package-option-list⟩]{⟨package-list⟩}[⟨version⟩]`

There can be any number of these declarations. All packages in *⟨package-list⟩* are called with the same options.

Each *⟨package⟩* file defines new elements (or modifies those defined in the *⟨class⟩*), and thus extends the range of documents which can be processed. The *⟨package-option-list⟩* is a list of options which can modify the formatting of elements defined in the *⟨package⟩* file. The *⟨version⟩* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the *⟨package-option-list⟩*, each package processes the *⟨main-option-list⟩*. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

`filecontents` (*env.*)

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of TeX. Finally, you can use `noheader` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

## 2.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

## 3 Class and Package interface

### 3.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{name}[version]` command. The *version* should begin with a date in the format YYYY/MM/DD.

### 3.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{name}[version]` command. The *version* should begin with a date in the format YYYY/MM/DD.

### 3.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[options]{name}[version].`

If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{options}{package}`.

`\PassOptionsToClass` This adds the *options* to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{name}[version]:`

This is similar to `\LoadClass`, but it always calls class *name* with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`. `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

`\IfPackageLoadedTF` To find out if a package has already been loaded, use  
`\IfClassLoadedTF` `\IfPackageLoadedTF{(package)}{<true>}{<false>}`  
`\@ifpackageloaded`  
`\@ifclassloaded`  
or the old name `\@ifpackageloaded`.  
`\IfPackageAtLeastTF` To find out if a package has already been loaded with a version equal to or more recent than `<date>`, use  
`\IfClassAtLeastTF` `\IfPackageAtLeastTF{(package)}{<date>}{{<true>}{<false>}}`  
`\@ifpackagelater`  
`\@ifclasslater`  
or the old name `\@ifpackagelater`.  
`\IfFormatAtLeastTF` To test the format date use  
`\IfFormatAtLeastTF{(date)}{<true>}{<false>}`  
`\IfPackageLoadedWithOptionsTF` To find out if a package has already been loaded with at least the options `<options>`,  
`\IfClassLoadedWithOptionsTF` use  
`\@ifpackagewith` `\IfPackageLoadedWithOptionsTF{(package)}{<options>}{{<true>}{<false>}}`  
`\@ifclasswith`  
or the old name `\@ifpackagewith`.  
There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

### 3.4 Declaring new options

Options for classes and packages are built using the same macros.

`\DeclareOption` To define a builtin option, use `\DeclareOption{<name>}{{<code>}}`.  
`\DeclareOption*` To define the default action to perform for local options which have not been declared, use `\DeclareOption*{{<code>}}`.  
*Note:* there should be no use of  
`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.  
Possible uses for `\DeclareOption*` include:  
`\DeclareOption*{}`  
Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)  
`\DeclareOption*{\@unkownoptionerror}`  
Complain about unknown local options. (The initial setting for package files.)  
`\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}`  
Handle the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building

‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```
\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%
{}%
{\OptionNotUsed}}
```

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

### 3.5 Safe Input Macros

|                                 |                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\InputIfFileExists</code> | <code>\InputIfFileExists{\langle file \rangle}{\langle then \rangle}{\langle else \rangle}</code>                                                                                                                                                                                                                                                             |
|                                 | Inputs <code>\langle file \rangle</code> if it exists. Immediately before the input, <code>\langle then \rangle</code> is executed. Otherwise <code>\langle else \rangle</code> is executed.                                                                                                                                                                  |
| <code>\IfExists</code>          | As above, but does not input the file.                                                                                                                                                                                                                                                                                                                        |
|                                 | One thing you might like to put in the <code>\langle else \rangle</code> clause is                                                                                                                                                                                                                                                                            |
| <code>\@missingfileerror</code> | This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering <code>x</code> quits the current run,                                                                                                                                                                  |
| <code>\input</code>             | This has been redefined from the L <sup>A</sup> T <sub>E</sub> X2.09 definition, in terms of the new commands <code>\InputIfFileExists</code> and <code>\@missingfileerror</code> .                                                                                                                                                                           |
| <code>\listfiles</code>         | Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to <code>\ProvidesPackage</code> are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument. |

## 4 Implementation

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

 30 \global\let\@currext=\@empty  
 (End definition for \@currext.)

\@clsextension The two possible values of \@currext.  
 \@pkgextension  
 31 \def\@clsextension{cls}  
 32 \def\@pkgextension{sty}

(End definition for \c@lsextension and \c@pkgeextension.)

```
\c@pushfilename Commands to push and pop the file name and extension.
\c@popfilename #1 current name.
\c@currnamestack #2 current extension.
#3 current catcode of @.
#4 Rest of the stack.
33 </2ekernel>
34 {*2ekernel | latexrelease}
35 {latexrelease}
36 {<tex>\IncludeInRelease{2020/10/01}{\c@pushfilename}}%
37 {<tex> {Add \c@expl@push@filename@@ and \c@expl@push@filename@aux@@}}%
38 {\def\c@pushfilename{%
```

The push and pop macros are injected in \c@pushfilename and \c@popfilename so that they correctly keep track of the hook labels.

This needs cleanup with the expl3 interfaces also playing here, e.g., \c@expl@push@filename@@ needs cleanup and (and should probably not have this name either).

```
39 \c@expl@push@filename@@
40 \xdef\c@currnamestack{
41 {\\@currname}}%
42 {\\@currext}}%
43 {\\the\\catcode`\\@}}%
44 \\@currnamestack}%
```

Temporarily add a stack for \c@currpath here. This should be integrated in the main file stack eventually, but other packages rely on \c@currnamestack having three elements per file, so that isn't a trivial change. The prefix \c@kernel@... hopefully discourages people from using it.

```
45 \\xdef\\@kernel@currpathstack{
46 {\\@currpath}}%
47 \\@kernel@currpathstack}}%
48 \\@expl@push@filename@aux@@}
49 {<tex>}\\EndIncludeInRelease
```

The following version of \c@pushfilename didn't formally exist in this file, but in the 2020/02/02 release, expl3 was preloaded and it patched \c@pushfilename (and \c@popfilename) by adding some hooks in there. But rolling back to 2020/02/02, expl3 doesn't patch these macros again, so rolling back has to take those hooks into account. Same goes for \c@popfilename.

```
50 {<tex>}
51 {<tex>}\\IncludeInRelease{2020/02/02}{\\c@pushfilename}}%
52 {<tex> {Add \\c@expl@push@filename@@}}%
53 {<tex> \\def\\c@pushfilename{
54 {<tex> \\c@expl@push@filename@@
55 {<tex> \\xdef\\c@currnamestack{
56 {<tex> {\\@currname}}%
57 {<tex> {\\@currext}}%
58 {<tex> {\\the\\catcode`\\@}}%
59 {<tex> \\@currnamestack}}%
60 {<tex> \\c@expl@push@filename@aux@@}
61 {<tex>}\\EndIncludeInRelease
62 {<tex>}
```

When we roll back from a release that has `\expl3` preloaded, the definitions of `\@pushfilename` and `\@popfilename` can't be completely rolled back otherwise `\ExplSyntaxOff`-based packages won't have the automatic `\ExplSyntaxOff` at the end. Here and below for `\@popfilename`, we don't roll back all the way through if coming from L<sup>A</sup>T<sub>E</sub>X > 2020 – 02 – 02.

```

106 ⟨latexrelease⟩\else
107 ⟨latexrelease⟩ \GenericInfo{}{Defining 2020-02-02\string\@popfilename.}

```

```

108 \def\@popfilename{\expandafter\@p@filename\@currnamestack\@nil
109 \def\@popfilename{\expandafter\@empty\@currnamestack\@nil}
110 \fi
111 \EndIncludeInRelease
112 \onlypreamble\@popfilename
113 {/2ekernel | latexrelease}
114 {*2ekernel}

115 \def\@p@filename#1#2#3#4\@nil{%
116 \gdef\@currname{#1}%
117 \gdef\@currext{#2}%
118 \catcode`\@#3\relax
119 \gdef\@currnamestack{#4}%
120 \onlypreamble\@p@filename
121 \gdef\@currnamestack{}%
122 \onlypreamble\@currnamestack

```

(End definition for `\@pushfilename`, `\@popfilename`, and `\@currnamestack`.)

`\@kernel@\currpathstack` Path to the current file if explicitly given. The auxiliary is needed here to insert a `\@empty` to prevent the loss of braces.

```

123 {/2ekernel}
124 {*2ekernel | latexrelease}
125 \def\@currpathstack{\@kernel@\currpathstack}%
126 \IncludeInRelease{2020/10/01}{\@kernel@\currpathstack}%
127 {\Add\@kernel@\currpathstack}%

```

If rolling backwards to this release, `\@kernel@\currpathstack` will be defined, so the `\gdef` line should not be executed, thus the `\@gobblethree` will take it out, so the stack isn't touched.

```

128 \IfUndefined{\@kernel@\currpathstack}{}{\@gobblethree}
129 \gdef\@kernel@\currpathstack{}%

```

If rolling forward to this release, then the `\gdef` line above will define the path stack to be empty (which it can't be, inside a file), so the code below will traverse the `\@currnamestack`, and add as many empty items to `\@kernel@\currpathstack` as there are items in `\@currnamestack`, so both are back in sync. Most of the time `latexrelease` is loaded on top-level, so only one item is needed, but `platexrelease` loads it internally, so the more complicated loop is needed.

```

130 \ifx\@kernel@\currpathstack\@empty
131 \def\reserved@a#1#2#3{%
132 \ifx\relax#3\else
133 \g@addto@macro\@kernel@\currpathstack{\{}%

`\default@ds` The default option code. Set by `\@onefilewithoptions` to either `\OptionNotUsed` for classes, or `\@unknownoptionerror` for packages. This may be reset in either case with `\DeclareOption*`.

```
471 % \let\default@ds\OptionNotUsed
```

(End definition for `\default@ds`.)

\ProcessOptions \ProcessOptions calls \ds@option for each known package option, then calls \default@ds for each option on the local options list. Finally resets all the declared options to \relax. The empty option does nothing, this has to be reset on the off chance it's set to \relax if an empty element gets into the \@declaredoptions list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of @.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```

We have to sanitise file names, so that something like

```

\usepackage{some/local/path/array}
\usepackage{array}

```

won't load `array.sty` twice. It is remotely possible that those are two different files, but as a matter of principles, we will consider that the base file name uniquely identifies a package, regardless of where it lives. This assumption already holds for file hooks, for example, which address the hook to a file by its base name only.

We'll use `\@expl@@@filehook@set@curr@file@nNN` to parse the file name and return the `<path>` and `<base+ext>` in separate token lists. Further ahead, most operations use `\@currname` which doesn't have a path attached to it; only few actions prepend `\@currpath` to `\@currname` (namely loading, as we have to respect the given path).

A file substitution isn't followed just yet because at this point we are parsing user input, so the file is still what the user asked for, and not the file actually loaded.

```

813 \@expl@@@filehook@set@curr@file@nNN{#1.#4}\reserved@a\reserved@b
814 \edef\reserved@c{\def\noexpand\reserved@c####1%
815 \detokenize\expandafter{\expanded{.##4}}%

818 \pushfilename
819 \xdef\@currname{\string@makeletter\reserved@a}%
820 \xdef\@currpath{\ifx\reserved@b\@empty\else\reserved@b/\fi}%
821 \global\let\@currext\@currpath

```

The command `\ver@⟨file⟩.⟨ext⟩` is used to signal that a package is already loaded, either because it is in fact loaded, or because its loading was suppressed. In minimal installations, said package may not exist but still have its loading suppressed with `\ver@⟨file⟩.⟨ext⟩`, so before checking if the file exists we have to check that we do need to load it with `\@ifl@aded`. If we don't, then there's no point in checking for a typo or load-disabling.

```
822 \@ifl@aded\@currname\@currname
```

In the current preferred approach, a key family name will exist for processing using `\ltkeys`. In that case, we replace the previous package options with the new ones, then call the key handler. Otherwise, we use the more classical clash handler.

```
823 {%
824 \@ifundefined{opt@fam@\@currname.\@currname}%
825 {\@onefilewithoptions@clashchk{\#2}}%
826 {%
827 \expandafter\edef\csname opt@\@currname.\@currname\endcsname
828 {\zap@space\#2 \@empty}%
829 \namedef{@raw@opt@\@currname.\@currname}{\#2}%
830 \expandafter\expandafter\expandafter\ProcessKeyOptions
831 \expandafter\expandafter\expandafter
832 [\csname opt@fam@\@currname.\@currname\endcsname]%
833 }%
834 }%
835 {\makeatletter
```

The next line seems to be necessary for 2.09 compatibility (the way the code is written there) This seems questionable and should be look at as in 2e it is definitely unnecessary at this point!

```
836 \@reset@ptions
```

First we take the `⟨name⟩` and `⟨ext⟩` given in the argument and check if the file exists, and issue an error otherwise asking for a correction with `\@missingfileerror`. For checking if the file exists we use `\@currpath` (usually empty) before `\@currname`.

```
837 \IfFileExists{\@currpath\@currname.\@currname}{}{%
838 {\@missing@onefilewithoptions{\#2}}%
```

If `\@currname` is empty (the user replied to the “Enter file name” prompt with `(RETURN)`), so stop here (do `\@popfilename` to pop the item just added above).

This `\@gobble` omits the date check at the end.

```
839 \ifx\@currname\@empty
840 \expandafter\@gobble
841 \else
```

If the file exists, check if it was load-prevented, and otherwise do the bookkeeping with `\@filehook@file@push` then call `\set@curr@file` to set `\@curr@file` (and do any required substitution), then actually load the class/package with `\load@onefile@withoptions`. `\set@curr@file` also needs the file path.

```
842 \@disable@packageload@do{\@currname.\@currname}%
843 {\@expl@@@filehook@file@push@@
844 \set@curr@file{\@currpath\@currname.\@currname}%
845 \@filehook@set@CurrentFile
```

The `\set@curr@file` line above might have replaced the file, so `\@currname` and `\@currext` may no longer hold the actual package being loaded, so in that case we need to update these two token lists (`\@curr@file` holds the file name after replacement, so we parse that).

The requested file is saved in `\@currpkg@reqd` to be used in `\InputIfFileExists` later: if the updated `\@currname` and `\@currext` are used we lose track of the substitution, so `\CurrentFile` and `\CurrentFileUsed` will be (incorrectly) the same.

```

846 \expandafter\@swaptwoargs\expandafter
847 {\expandafter{\@currpkg@reqd}}%
848 {%
849 \edef\@currpkg@reqd{\@currname.\@currext}%

877 {Option clash for \cls@pkg\space \@currname}%
878 {The package \@currname\space has already been loaded
879 with options:\MessageBreak
880 \space\space[\optionlist{\@currname.\@currext}]\MessageBreak
881 There has now been an attempt to load it}

```

```

882 with options\MessageBreak
883 \space\space[#1]\MessageBreak
884 Adding the global options:\MessageBreak
885 \space\space
886 \optionlist{\@currname.\@currext},#1\MessageBreak
887 to your \noexpand\documentclass declaration may fix this.%
888 \MessageBreak
889 Try typing \space <return> \space to proceed.}%
890 \@firstofone}

891 \let\@currpkg@reqd\empty
892 \@onlypreamble\@onefilewithoptions
 The kernel no longer uses \unprocessedoptions
893 \let\@unprocessedoptions\undefined

```

Now the action taken when a file is not found. Path must be included here as it eventually leads to a file lookup.

```

894 \def\@missing@onefilewithoptions#1{%
895 \@missingfileerror{\@currpath\@currname}\@currext
896 \global\let\@currpath\@missingfile@area
897 \global\let\@currname\@missingfile@base
898 \global\let\@currext\@missingfile@ext}

```

Now the code that actually does the file loading:

```

\load@onefile@withoptions
899 \def\load@onefile@withoptions#1{%
900 \let\CurrentOption\empty
901 \reset@options

```

Grab everything in a macro, so the parameter stack is popped before any processing begins.

```

902 \def\reserved@a{%
903 \pass@ptions\@currext{#1}{\@currname}%

904 \expandafter\let
905 \csname opt@\@currpkg@reqd\expandafter\endcsname
906 \csname opt@\@currname.\@currext\endcsname
907 \expandafter\let
908 \csname @raw@opt@\@currpkg@reqd\expandafter\endcsname
909 \csname @raw@opt@\@currname.\@currext\endcsname
910 \global\expandafter
911 \let\csname ver@\@currname.\@currext\endcsname\empty

```

We initialize \...-h@k here and only if we load the file so that it remains undefined otherwise.

```

912 \expandafter\let\csname\@currname.\@currext-h@k\endcsname\empty

```

When the current extension is \pkgextension we are loading a package otherwise, if it is \clsextension, a class, so depending on that we execute different hooks. If the extension is neither, then it is another type of file without special hooks.

```

913 %-----
914 \ifx\@currext\pkgextension
915 \UseHook{package/before}%
916 \UseOneTimeHook{package/\@currname/before}%
917 \else

```

```

918 \ifx\@currext\@clsextension
919 \UseHook{class/before}%
920 \UseOneTimeHook{class/\@currname/before}%
921 \fi
922 \fi

```

Now actually load the file (at this point we are certain it exists, but use `\InputIfFileExists` so that file hooks are executed). `\@currpath` is needed here too.

```

923 \InputIfFileExists{\@currpath\@currpkg@reqd}{}
924 {\@latex@error
925 {The \@cls@pkg\space\@currpkg@reqd\space failed to load}\@ehd}%
926 %-----

```

In older versions of the code `\@unprocessedoptions` would generate an error for each specified option in a package unless a `\ProcessOptions` has appeared in the package file.

This has changed in 2020. We now use a separate macro per package to avoid interference in case of nested packages. The whole code for handling this issue (GitHub 22) was provided by Hironobu Yamashita, thanks for that.

```

927 \expandafter\let\csname unprocessedoptions-\@currname.\@currext\endcsname
928 \@@unprocessedoptions
929 \csname\currname.\@currext-h@k\endcsname
930 \expandafter\let\csname\currname.\@currext-h@k\endcsname
931 \undefined

```

Catch the case where the packages has handled the options and redefined `\@unprocessedoptions` to `\relax` (old interface). In that case no error should be produced.

```

932 \ifx\@unprocessedoptions\relax
933 \let\@unprocessedoptions\undefined

```

Otherwise run the per package set of unused options.

```

934 \else
935 \csname unprocessedoptions-\@currname.\@currext\endcsname
936 \fi

```

In either case we drop the macro afterwards as it is no longer needed.

```

937 \expandafter\let
938 \csname unprocessedoptions-\@currname.\@currext\endcsname
939 \undefined

```

And same procedure, James, when we are finished loading, except that the hook order is now reversed.

```

940 %-----
941 \ifx\@currext\@pkgextension
942 \UseOneTimeHook{package/\@currname/after}%
943 \UseHook{package/after}%
944 \else
945 \ifx\@currext\@clsextension
946 \UseOneTimeHook{class/\@currname/after}%
947 \UseHook{class/after}%
948 \fi
949 \fi}%
950 %-----
951 \@ifl@aded\@currext\@currname{}{\reserved@a}

```

Now declare the non-generic package and class hooks used above:

```
952 \NewHook{package/before}
953 \NewHook{class/before}
954 \NewReversedHook{package/after}
955 \NewReversedHook{class/after}

956 </2ekernel | latexrelease>
957 <latexrelease>\EndIncludeInRelease
958 <latexrelease>\IncludeInRelease{0000/00/00}%
959 <latexrelease> {\@onefilewithoptions}{Hooks and unused options issue}%
960 <latexrelease>
```

Because of the way `\@onefilewithoptions` is changed for rollback handling below we have to define `\load@onefilewithoptions` when rolling back!

```
961 <latexrelease>\def\load@onefilewithoptions#1[#2] [#3] #4{%

## 5 Package/class rollback mechanism

```

1473 〈/2ekernel〉
1474 〈*2ekernel | \latexreleasefirst〉

\pkgcls@debug For testing we have a few extra lines of code that by default do nothing but one can
set \pkgcls@debug to \typeout to get extra info. Sometime in the future this will be
dropped.

1475 〈*tracerollback〉
1476 %\let\pkgcls@debug\typeout
1477 \let\pkgcls@debug@gobble
1478 〈/tracerollback〉

(End definition for \pkgcls@debug.)

\requestedLaTeXdate The macro (!) \requestedLaTeXdate holds the globally requested rollback date (via
\latexrelease) or zero if no such request was made.

1479 \def\requestedLaTeXdate{0}

```

(End definition for \requestedLaTeXdate.)

\pkgcls@targetdate If a rollback for a package or class is requested then \pkgcls@targetdate holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of \requestedLaTeXdate) and \pkgcls@targetlabel will be empty. If there was a request for a named version then \pkgcls@targetlabel holds the version name and \pkgcls@targetdate is set to 1.

\pkgcls@targetdate=0 is used to indicate that there was no rollback request. While loading an old release \pkgcls@targetdate is also reset to zero so that \DeclareRelease declarations are bypassed.

In contrast \pkgcls@innerdate will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain TeX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```
1480 \ifx\pkgcls@targetdate\@undefined
1481 \newcount\pkgcls@targetdate
1482 \fi
1483 \let\pkgcls@targetlabel\@empty
1484 \def\pkgcls@innerdate{\maxdimen}
```

(End definition for \pkgcls@targetdate, \pkgcls@targetlabel, and \pkgcls@innerdate.)

\pkgcls@candidate When looping through the \DeclareRelease declarations we record if the release is the best candidate we have seen so far. This is recorded in \pkgcls@candidate and we update it whenever we see a better one.

In \pkgcls@releasedate we keep track of the release date of that candidate.

```
1485 \let\pkgcls@candidate\@empty
1486 \let\pkgcls@releasedate\@empty
```

(End definition for \pkgcls@candidate and \pkgcls@releasedate.)

\load@onefilewithoptions the best place to add the rollback code is at the point where \load@onefilewithoptions is called to load a single class or package.

To make things easy we save the old definition as \load@onefilewithoptions and then provide a new interface.

Important: as this code is also unconditionally placed into latexrelease we can only do this name change once otherwise both macros will contain the same code.

```
1487 \ifx\load@onefilewithoptions\@undefined
1488 \let\load@onefilewithoptions\@onefilewithoptions
1489 \def\@onefilewithoptions#1[#2] [#3] #4{%
```

First a bit of tracing normally disabled.

```
1490 (*tracerollback)
1491 \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
1492 \pkgcls@debug{\@spaces 1: #1}%
1493 \pkgcls@debug{\@spaces 2: #2}%
1494 \pkgcls@debug{\@spaces 3: #3}%
1495 \pkgcls@debug{\@spaces 4: #4}%
1496 (/tracerollback)
```

Two of the arguments are needed later on in error/warning messages so we save them.

```
1497 \def\pkgcls@name{\#1}% % for info message
1498 \def\pkgcls@arg {\#3}% % for info message
```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```
1499 \pkgcls@parse@date@arg{#3}%
```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```
1500 \let\pkgcls@candidate\empty
```

If we had a rollback request then #3 may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`. We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```
1501 \begingroup
1502 \edef\reserved@a{%
1503 \endgroup
1504 \unexpanded{\load@onefilewithoptions#1[#2]}%
1505 [\pkgcls@mindate]%
1506 \unexpanded{#4}%
1507 \reserved@a
1508 }
1509 \fi
```

(End definition for `\load@onefilewithoptions` and `\onefilewithoptions`.)

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn't start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

| Input                  | <code>\pkgcls@targetdate</code>             | <code>\pkgcls@targetlabel</code> | <code>\pkgcls@mindate</code> |
|------------------------|---------------------------------------------|----------------------------------|------------------------------|
| <code>\empty</code>    | <code>\global rollbackdate-as-number</code> | <code>\empty</code>              | <code>\empty</code>          |
| <code>\date</code>     | <code>\global rollbackdate-as-number</code> | <code>\empty</code>              | <code>\date</code>           |
| <code>=\date</code>    | <code>\date-as-number</code>                | <code>\empty</code>              | <code>\empty</code>          |
| <code>=\version</code> | 1                                           | <code>\version</code>            | <code>\empty</code>          |
| <code>\other</code>    | <code>\global rollbackdate-as-number</code> | <code>\empty</code>              | <code>\other</code>          |

where `\global rollbackdate-as-number` is a date request given via `latexrelease` or if there wasn't one 0.

```
1510 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `\latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
1511 \ifx\@nil#1\@nil
1512 \pkgcls@targetdate\requestedLaTeXdate\relax
1513 \let\pkgcls@targetlabel\@empty
1514 \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
1515 \else
1516 \pkgcls@parse@date@arg@#1=\@nil\relax
1517 \fi
1518 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@:`

```
1519 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
1520 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
1521 \ifx\@nil#1\@nil
1522 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```
1523 \ifnum \pkgcls@targetdate=\z@
1524 \pkgcls@targetdate\@ne
1525 \def\pkgcls@innerdate{\maxdimen}%
1526 \pkgcls@parse@date@arg@version#2%
1527 \else
1528 \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
1529 \fi
1530 \let\pkgcls@mindate\@empty
1531 \else
```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of `\pkgcls@targetdate`):

```
1532 \requestedLaTeXdate\relax
1533 \let\pkgcls@targetlabel\@empty
1534 \def\pkgcls@innerdate{\maxdimen}%
1535 \def\pkgcls@mindate{\#1}%
```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```

1536 \ifnum \pkgcls@targetdate > \z@

1537 \ifnum \parse@version#1//00@nil > \pkgcls@targetdate

1538 @latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak

1539 A minimal date of #1 has been specified for

1540 \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak

1541 But this is in conflict

1542 with a rollback request to \requestedpatchdate}

1543 \fi

1544 \fi

1545 \fi

1546 }

Strip off the trailing = and assign the version name to \pkgcls@targetlabel.

1547 \def\pkgcls@parse@date@arg@version#1=%

1548 \def\pkgcls@targetlabel{-#1}

(End definition for \pkgcls@parse@date@arg.)
```

`\DeclareRelease` First argument is the “name” of the release and it can be left empty if one doesn’t like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be `<pkg/cls-name>-<date>.(<extension>)` but this is not enforced and through this argument one can overwrite it.

```

1549 \def\DeclareRelease#1#2#3%

1551 {*tracerollback}

1552 \pkgcls@debug{---\string\DeclareRelease:{}%

1553 \pkgcls@debug{\@spaces 1: #1}%

1554 \pkgcls@debug{\@spaces 2: #2}%

1555 \pkgcls@debug{\@spaces 3: #3}%

1556 */tracerollback}
```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

1557 \ifx\@nil#2\@nil

1558 \ifnum\pkgcls@targetdate=\@ne % named request

1559 \def\reserved@a{#1}%

1560 \ifx\pkgcls@targetlabel\reserved@a

1561 \pkgcls@use@this@release{#3}{ }%

1562 {*tracerollback}

1563 \else

1564 \pkgcls@debug{Label doesn't match} %

1565 */tracerollback

1566 \fi

1567 {*tracerollback}

1568 \else

1569 \pkgcls@debug{Date request: ignored} %

1570 */tracerollback

1571 \fi

1572 \else
```

If the value of `\pkgcls@targetdate` is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```
1573 \ifnum\pkgcls@targetdate>\@ne % a real request
```

So we parse the date of this release to check if it is before or after the request date.

```
1574 \ifnum\@parse@version#2//00\@nil
1575 >\pkgcls@targetdate
```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exist). So we make a complained to the user.

```
1576 \ifx\pkgcls@candidate\@empty
1577 \pkgcls@rollbackdate@error{#2}%
1578 \pkgcls@use@this@release{#3}{#2}%
1579 \else
1580 \pkgcls@use@this@release\pkgcls@candidate
1581 \pkgcls@releasedate
1582 \fi
1583 \else
```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```
1584 \def\pkgcls@candidate{#3}%
1585 \def\pkgcls@releasedate{#2}%
1586 (*tracer rollback)
1587 \pkgcls@debug{New candidate: #3}%
1588 (/tracer rollback)
1589 \fi
1590 \else
```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```
1591 \def\reserved@a{#1}%
1592 \ifx\pkgcls@targetlabel\reserved@a
1593 \pkgcls@use@this@release{#3}{#2}%
1594 (*tracer rollback)
1595 \else
1596 \pkgcls@debug{Label doesn't match}%
1597 (/tracer rollback)
1598 \fi
1599 \fi
1600 \fi
1601 \fi
1602 }
```

*(End definition for \DeclareRelease.)*

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```
1603 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```
1604 \pkgcls@show@selection{#1}{#2}%
```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed<sup>39</sup> and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `\@@input`!

```
1605 \pkgcls@targetdate\z@
1606 \@@input #1\relax
1607 \endinput
1608 }
```

*(End definition for `\pkgcls@use@this@release`.)*

#### `\pkgcls@show@selection`

This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```
1609 \def\pkgcls@show@selection#1#2{
1610 {*tracerollback}
1611 \pkgcls@debug{Result: use #1}%
1612 {*}tracerollback}
1613 \GenericInfo
1614 {\@spaces\@spaces\space}{Rollback for
1615 \@cls@pkg\space'@\currname' requested ->
1616 \ifnum\pkgcls@targetdate>\@ne
1617 date
1618 \ifnum\requestedLaTeXdate=\pkgcls@targetdate
1619 \requestedpatchdate
1620 \else
1621 \expandafter\gobble\pkgcls@arg
1622 \fi.\MessageBreak
```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```
1623 Best approximation is
1624 \else
1625 version '\pkgcls@targetlabel'.\MessageBreak
1626 This corresponds to
1627 \fi
1628 \ifx\@nil#2\@nil
1629 a special release%
1630 \else
1631 the release introduced on #2%
1632 \fi
1633 \gobble}%">
1634 }
```

---

<sup>39</sup>The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

*(End definition for \pkgcls@show@selection.)*

\pkgcls@rollbackdate@error This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```
1635 \def\pkgcls@rollbackdate@error#1{%
1636 \@latex@error{Suspicious rollback date given}%
1637 {The '\@cls@pkg\space'\@currname' has no rollback data
1638 before #1 which\MessageBreak
1639 is after your requested rollback date --- so
1640 something may be wrong here.\MessageBreak
1641 Continue and we use the earliest known release.}}}
```

*(End definition for \pkgcls@rollbackdate@error.)*

\DeclareCurrentRelease This declares the date (and possible name) of the current version of a package or class.

```
1642 \def\DeclareCurrentRelease#1#2{%
```

First we test if \pkgcls@targetdate is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```
1643 \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
1644 (*tracerollback)
1645 \pkgcls@debug{---DeclareCurrentRelease}%
1646 \pkgcls@debug{ 1: #1}%
1647 \pkgcls@debug{ 2: #2}%
1648 (/tracerollback)
```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```
1649 \ifnum\pkgcls@targetdate>\z@ % a date request
1650 \ifnum\@parse@version#2//00@nil
1651 >\pkgcls@targetdate
```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a \DeclareCurrentRelease but no declared older releases (so basically the use of the declaration is a bit dubious).

```
1652 \ifx\pkgcls@candidate@\empty
1653 \pkgcls@rollbackdate@error{#2}%
1654 \else
1655 \pkgcls@use@this@release\pkgcls@candidate
1656 \pkgcls@releasedate
1657 \fi
```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```
1658 \else
1659 \pkgcls@show@selection{current version}{#2}%
1660 \fi
1661 \else % a label request
```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1662 \def\reserved@a{#1}%
1663 \ifx\pkgcls@targetlabel\reserved@a
1664 \pkgcls@show@selection{current version}{#2}%
1665 \else
1666 \@latex@error{Requested version '\pkgcls@targetlabel' for
1667 '@cls@pkg`space' '@currname' is unknown}@\ehc
1668 \fi
1669 \fi
1670 \fi
1671 }
```

*(End definition for \DeclareCurrentRelease.)*

- \IfTargetDateBefore This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

1672 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1673 \ifnum\pkgcls@innerdate <%
1674 \expandafter\@parse@version\expandafter#1//00@nil
1675 \typeout{Exclude code introduced on #1}%
1676 \expandafter\@firstoftwo
1677 \else
1678 \typeout{Include code introduced on #1}%
1679 \expandafter\@secondoftwo
1680 \fi
1681 }
```

*(End definition for \IfTargetDateBefore.)*

```
1682 </2ekernel | latexreleasefirst>
```

## 6 After Preamble

Finally we declare a package that allows all the commands declared above to be \onlypreamble to be used after \begin{document}.

```

1683 <@afterpreamble>
1684 \NeedsTeXFormat{LaTeX2e}
1685 \ProvidesPackage{pkgindoc}
1686 [2020-08-08 v1.3m Package Interface in Document (DPC)]
1687 \def\reserved@a#1\do@classoptionslist#2\do\filec@ntents#3\relax{%
1688 \gdef\@preamblecmds{#1#3}}
1689 \expandafter\reserved@a\@preamblecmds\relax
1690 </@afterpreamble>
```

# File V

## ltkeys.dtx

### 1 Creating and using keyval options

As with any key–value input, using key–value pairs as package or class options has two parts: creating the key options and setting (using) them. Options created in this way *may* be used after package loading as general key–value settings: this will depend on the nature of the underlying code.

---

```
\DeclareKeys \DeclareKeys [⟨family⟩] {⟨declarations⟩}
```

Creates a series of options from a comma-separated ⟨declarations⟩ list. Each entry in this list is a key–value pair, with the ⟨key⟩ having one or more ⟨properties⟩. A small number of “basic” ⟨properties⟩ are described below. The full range of properties, provided by l3keys, can also be used for more powerful processing. See `interface3` for the full details.

The basic properties provided here are

- `.code` — execute arbitrary code
- `.if` — sets a TeX `\if...` switch
- `.store` — stores a value in a macro
- `.usage` — defines whether the option can be given only when loading (`load`), in the preamble (`preamble`) or has no limitation on scope (`general`)

The part of the ⟨key⟩ before the ⟨property⟩ is the ⟨name⟩, with the ⟨value⟩ working with the ⟨property⟩ to define the behaviour of the option.

For example, with

```
\DeclareKeys[mypkg]
{
 draft.if = @mypkg@draft ,
 draft.usage = preamble ,
 name.store = \@mypkg@name ,
 name.usage = load ,
 second-name.store = \@mypkg@other@name
}
```

three options would be created. The option `draft` can be given anywhere in the preamble, and will set a switch called `\if@mypkg@draft`. The option `name` can only be given during package loading, and will save whatever value it is given in `\@mypkg@name`. Finally, the option `second-name` can be given anywhere, and will save its value in `\@mypkg@other@name`.

Keys created *before* the use of `\ProcessKeyOptionsact` as package options.

---

```
\DeclareUnknownKeyHandler \DeclareUnknownKeyHandler [⟨family⟩] {⟨code⟩}
```

The function `\DeclareUnknownKeyHandler` may be used to define the behavior when an undefined key is encountered. The ⟨code⟩ will receive the unknown key name as #1 and the value as #2. These can then be processed as appropriate, e.g. by forwarding to another package.

---

```
\ProcessKeyOptions \ProcessKeyOptions [<family>]
```

---

The `\ProcessKeyOptions` function is used to check the current option list against the keys defined for `<family>`. Global (class) options and local (package) options are checked when this function is called in a package.

---

```
\SetKeys \SetKeys [<family>] {<keyvals>}
```

---

Sets (applies) the explicit list of `<keyvals>` for the `<family>`: if the latter is not given, the value of `\@currname` used. This command may be used within a package to set options before or after using `\ProcessKeyOptions`.

## 1.1 Implementation of `ltkeys`

```
1 <@=keys>
2 <2ekernel>
3 \ExplSyntaxOn
```

## 1.2 Key properties

```
.code
.if
4 \group_begin:
.store
5 \cs_set_protected:Npn __keys_tmp:nn #1#2
.usage
6 {
7 \quark_if_recursion_tail_stop:n {#1}
8 \cs_new_eq:cc
9 { \c_keys_props_root_str . #2 }
10 { \c_keys_props_root_str . #1 }
11 __keys_tmp:nn
12 }
13 __keys_tmp:nn
14 { code:n } { code }
15 { legacy_if_set:n } { if }
16 { tl_set:N } { store }
17 { usage:n } { usage }
18 { \q_recursion_tail } { }
19 \q_recursion_stop
20 \group_end:
```

(End definition for `.code` and others.)

## 1.3 Main mechanism

```
21 \cs_generate_variant:Nn \clist_put_right:Nn { Nv }
```

`\l__keys_options_clist` A single list is used for all options, into which they are collected before processing.

```
22 \clist_new:N \l__keys_options_clist
```

(End definition for `\l__keys_options_clist`.)

---

```
\l__keys_options_loading_bool
```

---

Used to indicate we are in the loading phase: controls the outcome of warnings.

```
23 \bool_new:N \l__keys_options_loading_bool
```

`\__keys_options:n` The main function calls functions to collect up the global and local options into `\l__keys_options_clist` before calling the underlying functions to actually do the processing. So that a suitable message is produced if the option is unknown, the special `unknown` key is set if it does not already exist for the current family, and is cleaned up afterwards if required. To allow the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  layer to know this mechanism is active, and to deal with the key family not matching the file name, we store the family in all cases.

```

24 \cs_new_protected:Npn __keys_options:n #1
25 { __keys_options_expand_module:Nn __keys_options_aux:n {#1} }
26 \cs_new_protected:Npn __keys_options_aux:n #1
27 {
28 \cs_gset_nopar:cpn { opt@fam@\currname.\currext } {#1}
29 \cs_set_protected:Npn __keys_option_end: { }
30 \clist_clear:N \l__keys_options_clist
31 __keys_options_global:n {#1}
32 __keys_options_local:
33 \keys_if_exist:nnF {#1} { unknown }
34 {
35 \keys_define:nn {#1}
36 {
37 unknown .code:n =
38 {
39 \msg_error:nnxx { keys } { option-unknown }
40 { \l_keys_key_str } { \currname }
41 }
42 }
43 \cs_set_protected:Npn __keys_option_end:
44 { \keys_define:nn {#1} { unknown .undefine: } }
45 }
46 \bool_set_true:N \l__keys_options_loading_bool
47 \clist_map_variable:NNn \l__keys_options_clist \CurrentOption
48 { \keys_set:nV {#1} \CurrentOption }
49 \bool_set_false:N \l__keys_options_loading_bool
50 \AtEndOfPackage { \cs_set_eq:NN \unprocessedoptions \scan_stop: }
51 __keys_option_end:
52 __keys_options_loaded:n {#1}
53 }
54 \msg_new:nnnn { keys } { option-unknown }
55 { Unknown~option~'#1'~for~package~#2. }
56 {
57 LaTeX-has-been-asked-to-set-an-option-called-'#1'-
58 but-the-#2-package-has-not-created-an-option-with-this-name.
59 }

```

(End definition for `\__keys_options:n`, `\__keys_options_aux:n`, and `\__keys_options_end:.`)

`\__keys_options_global:n` Global (class) options are handled differently for L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  packages and classes. Hence this function is essentially a check on the current file type. The initial test is needed as L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  allows variables to be equal to `\scan_stop:`, which is usually forbidden in `expl3` code.

```

60 \cs_new_protected:Npn __keys_options_global:n #1
61 {
62 \cs_if_eq:NNF \raw@classoptionslist \scan_stop:
63 {

```

```

64 \cs_if_eq:NNTF \currext \clsextension
65 { _keys_options_class:n {#1} }
66 { _keys_options_package:n {#1} }
67 }
68 }

```

(End definition for `\_keys_options_global:n`.)

`\_keys_options_class:n` For classes, each option (stripped of any content after =) is checked for existence as a key. If found, the option is added to the combined list for processing. On the other hand, unused options are stored up in `\@unusedoptionlist`. Before any of that, though, there is a simple check to see if there is an unknown key. If there is, then *everything* will match and the mapping can be skipped.

```

69 \cs_new_protected:Npn _keys_options_class:n #1
70 {
71 \cs_if_free:cF { @raw@opt@ \currname . \currext }
72 {
73 \keys_if_exist:nnTF {#1} { unknown }
74 {
75 \clist_put_right:Nv _keys_options_clist
76 { @raw@opt@ \currname . \currext }
77 }
78 {
79 \clist_map_inline:cn { @raw@opt@ \currname . \currext }
80 {
81 \exp_args:Ne _keys_options_class:nnn
82 { _keys_remove_equals:n {##1} }
83 {##1} {#1}
84 }
85 }
86 }
87 }
88 \cs_new_protected:Npn _keys_options_class:nnn #1#2#3
89 {
90 \keys_if_exist:nnTF {#3} {#1}
91 {
92 \clist_put_right:Nn _keys_options_clist {#2}
93 {
94 \str_if_eq:eeF
95 { \exp_not:v { @raw@opt@ \currname . \currext } }
96 { \exp_not:V \@raw@classoptionslist }
97 { \clist_put_right:Nn \@unusedoptionlist {#1} }
98 }
99 }
100 }

```

(End definition for `\_keys_options_class:n` and `\_keys_options_class:nnn`.)

`\_keys_options_package:n` For global options when processing a package, the tasks are slightly different from those for a class. The check is the same, but here there is nothing to do if the option is not applicable. Each valid option also needs to be removed from `\@unusedoptionlist`.

```

101 \cs_new_protected:Npn _keys_options_package:n #1
102 {
103 \clist_map_inline:Nn \@raw@classoptionslist
104 {
105 \exp_args:Ne _keys_options_package:nnn

```

```

104 { __keys_remove_equals:n {##1} }
105 {##1} {#1}
106 }
107 }
108 \cs_new_protected:Npn __keys_options_package:nnn #1#2#3
109 {
110 \keys_if_exist:nnT {#3} {#1}
111 {
112 \clist_put_right:Nn \l__keys_options_clist {#2}
113 \clist_remove_all:Nn \@unusedoptionlist {#1}
114 }
115 }

```

(End definition for `\__keys_options_package:n` and `\__keys_options_package:nnn`.)

`\__keys_options_local:` If local options are found, they are added to the processing list. L<sup>A</sup>T<sub>E</sub>X 2<sub><</sub> stores options for each file in a macro which may or may not exist, hence the need to use `\cs_if_exist:c`.

```

116 \cs_new_protected:Npn __keys_options_local:
117 {
118 \cs_if_eq:NNF \@currext \@clsextension
119 {
120 \cs_if_exist:cT { @raw@opt@ \@currname . \@currext }
121 {
122 \clist_put_right:Nv \l__keys_options_clist
123 { @raw@opt@ \@currname . \@currext }
124 }
125 }
126 }

```

(End definition for `\__keys_options_local`.)

`\__keys_remove_equals:n` As the name suggests, this is a simple function to remove an equals sign from the input.  
`\__keys_remove_equals:w` This is all wrapped up in an `n` function so that there will always be a sign available.

```

127 \cs_new:Npn __keys_remove_equals:n #1
128 { __keys_remove_equals:w #1 = \s__keys_stop }
129 \cs_new:Npn __keys_remove_equals:w #1 = #2 \s__keys_stop { \exp_not:n {#1} }

```

(End definition for `\__keys_remove_equals:n` and `\__keys_remove_equals:w`.)

## 1.4 The document interfaces

```
130 \cs_generate_variant:Nn \keys_define:nn { nx }
```

`\__keys_options_expand_module:Nn` `\__keys_options_expand_module:nN` To deal with active characters inside the module argument whilst also expanding that argument, we use a combination of c- and f-type expansion. This works as the definitions for active UTF-8 bytes contain an `\ifincharname` test.

```

131 \cs_new_protected:Npn __keys_options_expand_module:Nn #1#2
132 {
133 \cs:w __keys_options_expand_module:nN \use:e { \cs_end: {#2} } #1
134 }
135 \cs_new_protected:Npn __keys_options_expand_module:nN #1#2
136 { #2 {#1} }

```

(End definition for `\__keys_options_expand_module:Nn` and `\__keys_options_expand_module:nN`.)

**\DeclareKeys** Defining key options is quite straight-forward: we have an intermediate function to allow for potential set-up steps.

```
137 \NewDocumentCommand \DeclareKeys { 0 { \@currname } +m }
138 { __keys_options_expand_module:Nn \keys_define:nn {#1} {#2} }
```

(End definition for `\DeclareKeys`. This function is documented on page 869.)

**\DeclareUnknownKeyHandler**

```
139 \NewDocumentCommand \DeclareUnknownKeyHandler { 0 { \@currname } +m }
140 {
141 \cs_set_protected:cpn { __keys_unknown_handler_ #1 :nn } ##1##2 {#2}
142 __keys_options_expand_module:Nn \keys_define:nx {#1}
143 {
144 unknown .code:n =
145 \exp_not:N \exp_args:NV
146 \exp_not:c { __keys_unknown_handler_ #1 :nn }
147 \exp_not:N \l_keys_key_str {####1}
148 }
149 }
```

(End definition for `\DeclareUnknownKeyHandler`. This function is documented on page 869.)

**\ProcessKeyOptions**

We need to deal with the older interface from l3keys2e here: it had a mandatory argument. We can mop that up using a look-ahead, and then exploit that information to determine whether the package option handling is set up for the new approach for clash handling.

```
150 \NewDocumentCommand \ProcessKeyOptions { 0 { \@currname } }
151 { __keys_options:n {#1} }
152 \onlypreamble \ProcessKeyOptions
```

(End definition for `\ProcessKeyOptions`. This function is documented on page 870.)

## 1.5 Option usage scope

Indicates that the load-time options for a package have been processed: once this has happened, make them unavailable either with a warning or an error.

```
153 \cs_new_protected:Npn __keys_options_loaded:n #1
154 {
155 \prop_get:NnNT \l_keys_usage_load_prop {#1} \l__keys_tmpa_tl
156 {
157 \clist_map_inline:Nn \l__keys_tmpa_tl
158 {
159 \keys_define:nn {#1}
160 {
161 ##1 .code:n =

# File W

## ltfilehook.dtx

### 1 Introduction

#### 1.1 Provided hooks

The code offers a number of hooks into which packages (or the user) can add code to support different use cases. Many hooks are offered as pairs (i.e., the second hook is reversed). Also important to know is that these pairs are properly nested with respect to other pairs of hooks.

There are hooks that are executed for all files of a certain type (if they contain code), e.g., for all “include files” or all “packages”, and there are also hooks that are specific to a single file, e.g., do something after the package `foo.sty` has been loaded.

#### 1.2 General hooks for file reading

There are four hooks that are called for each file that is read using document-level commands such as `\input`, `\include`, `\usepackage`, etc. They are not called for files read using internal low-level methods, such as `\Cinput` or `\openin`.

---

`file/before`  
`file/.../before`  
`file/.../after`  
`file/after`

---

These are:

`file/before`, `file/<file-name>/before` These hooks are executed in that order just before the file is loaded for reading. The code of the first hook is used with every file, while the second is executed only for the file with matching `<file-name>` allowing you to specify code that only applies to one file.

`file/<file-name>/after`, `file/after` These hooks are after the file with name `<file-name>` has been fully consumed. The order is swapped (the specific one comes first) so that the `/before` and `/after` hooks nest properly, which is important if any of them involve grouping (e.g., contain environments, for example). Furthermore both hooks are reversed hooks to support correct nesting of different packages adding code to both `/before` and `/after` hooks.

So the overall sequence of hook processing for any file read through the user interface commands of L<sup>A</sup>T<sub>E</sub>X is:

```
\UseHook{<file/before>}\n\UseHook{<file/<file name>/before>}\n <file contents>\n\UseHook{<file/<file name>/after>}\n\UseHook{<file/after>}
```

The file hooks only refer to the file by its name and extension, so the `<file name>` should be the file name as it is on the filesystem with extension (if any) and without paths. Different from `\input` and similar commands, the `.tex` extension is not assumed in hook `<file name>`, so `.tex` files must be specified with their extension to be recognized. Files within subfolders should also be addressed by their name and extension only.

Extensionless files also work, and should then be given without extension. Note however that  $\text{\TeX}$  prioritizes `.tex` files, so if two files `foo` and `foo.tex` exist in the search path, only the latter will be seen.

When a file is input, the  $\langle\text{file name}\rangle$  is available in `\CurrentFile`, which is then used when accessing the `file/\langle\text{file name}\rangle/before` and `file/\langle\text{file name}\rangle/after`.

---

**`\CurrentFile`** The name of the file about to be read (or just finished) is available to the hooks through `\CurrentFile` (there is no `\expl3` name for it for now). The file is always provided with its extension, i.e., how it appears on your hard drive, but without any specified path to it. For example, `\input{sample}` and `\input{app/sample.tex}` would both have `\CurrentFile` being `sample.tex`.

---

**`\CurrentFilePath`** The path to the current file (complement to `\CurrentFile`) is available in `\CurrentFilePath` if needed. The paths returned in `\CurrentFilePath` are only user paths, given through `\input@path` (or `\expl3`'s equivalent `\l_file_search_path_seq`) or by directly typing in the path in the `\input` command or equivalent. Files located by `\kpsewhich` get the path added internally by the  $\text{\TeX}$  implementation, so at the macro level it looks as if the file were in the current folder, so the path in `\CurrentFilePath` is empty in these cases (package and class files, mostly).

---

**`\CurrentFileUsed`** **`\CurrentFilePathUsed`** In normal circumstances these are identical to `\CurrentFile` and `\CurrentFilePath`. They will differ when a file substitution has occurred for `\CurrentFile`. In that case, `\CurrentFileUsed` and `\CurrentFilePathUsed` will hold the actual file name and path loaded by  $\text{\TeX}$ , while `\CurrentFile` and `\CurrentFilePath` will hold the names that were *asked for*. Unless doing very specific work on the file being read, `\CurrentFile` and `\CurrentFilePath` should be enough.

### 1.3 Hooks for package and class files

Commands to load package and class files (e.g., `\usepackage`, `\RequirePackage`, `\LoadPackageWithOptions`, etc.) offer the hooks from section 1.2 when they are used to load a package or class file, e.g., `file/array.sty/after` would be called after the `array` package got loaded. But as packages and classes form as special group of files, there are some additional hooks available that only apply when a package or class is loaded.

---

**`package/before`** These are:

**`package/after`**

**`package/.../before`** **`package/before, package/after`** These hooks are called for each package being loaded.

**`package/.../after`**

**`class/before`** **`package/\langle name \rangle/before, package/\langle name \rangle/after`** These hooks are additionally called if the package name is  $\langle\text{name}\rangle$  (without extension).

**`class/after`**

**`class/.../before`** **`class/before, class/after`** These hooks are called for each class being loaded.

**`class/.../after`**

**`class/\langle name \rangle/before, class/\langle name \rangle/after`** These hooks are additionally called if the class name is  $\langle\text{name}\rangle$  (without extension).

All `/after` hooks are implemented as reversed hooks.  
The overall sequence of execution for `\usepackage` and friends is therefore:

```
\UseHook{\<package>/before}
\UseHook{\<package>/\<package name>/before}
 \UseHook{\<file>/before}
 \UseHook{\<file>/\<package name>.sty/before}
 <package contents>
 \UseHook{\<file>/\<package name>.sty/after}
 \UseHook{\<file>/after}

code from \AtEndOfPackage if used inside the package

\UseHook{\<package>/\<package name>/after}
\UseHook{\<package>/after}
```

and similar for class file loading, except that `package/` is replaced by `class/` and `\AtEndOfPackage` by `\AtEndOfClass`.

If a package or class is not loaded (or it was loaded before the hooks were set) none of the hooks are executed!

All class or package hooks involving the name of the class or package are implemented as one-time hooks, whereas all other such hooks are normal hooks. This allows for the following use case

```
\AddToHook{package/varioref/after}
 { ... apply my customizations if the package gets
 loaded (or was loaded already) ... }
```

without the need to first test if the package is already loaded.

## 1.4 Hooks for `\include` files

To manage `\include` files, L<sup>A</sup>T<sub>E</sub>X issues a `\clearpage` before and after loading such a file. Depending on the use case one may want to execute code before or after these `\clearpages` especially for the one that is issued at the end.

Executing code before the final `\clearpage`, means that the code is processed while the last page of the included material is still under construction. Executing code after it means that all floats from inside the include file are placed (which might have added further pages) and the final page has finished.

Because of these different scenarios we offer hooks in three places.<sup>40</sup> None of the hooks are executed when an `\include` file is bypassed because of an `\includeonly` declaration. They are, however, all executed if L<sup>A</sup>T<sub>E</sub>X makes an attempt to load the `\include` file (even if it doesn't exist and all that happens is "No file `\<filename>.tex`").

---

<sup>40</sup>If you want to execute code before the first `\clearpage` there is no need to use a hook—you can write it directly in front of the `\include`.

---

`include/before`  
`include/.../before`  
`include/end`  
`include/.../end`  
`include/after`  
`include/.../after`

These are:

`include/before, include/<name>/before` These hooks are executed (in that order) after the initial `\clearpage` and after `.aux` file is changed to use `<name>.aux`, but before the `<name>.tex` file is loaded. In other words they are executed at the very beginning of the first page of the `\include` file.

`include/<name>/end, include/end` These hooks are executed (in that order) after L<sup>A</sup>T<sub>E</sub>X has stopped reading from the `\include` file, but before it has issued a `\clearpage` to output any deferred floats.

`include/<name>/after, include/after` These hooks are executed (in that order) after L<sup>A</sup>T<sub>E</sub>X has issued the `\clearpage` but before it has switched back writing to the main `.aux` file. Thus technically we are still inside the `\include` and if the hooks generate any further typeset material including anything that writes to the `.aux` file, then it would be considered part of the included material and bypassed if it is not loaded because of some `\includeonly` statement.<sup>41</sup>

`include/excluded, include/<name>/excluded` The above hooks for `\include` files are only executed when the file is loaded (or more exactly the load is attempted). If, however, the `\include` file is explicitly excluded (through an `\includeonly` statement) the above hooks are bypassed and instead the `include/excluded` hook followed by the `include/<name>/excluded` hook are executed. This happens after L<sup>A</sup>T<sub>E</sub>X has loaded the `.aux` file for this include file, i.e., after L<sup>A</sup>T<sub>E</sub>X has updated its counters to pretend that the file was seen.

All `include` hooks involving the name of the included file are implemented as one-time hooks (whereas all other such hooks are normal hooks).

If you want to execute code that is run for every `\include` regardless of whether or not it is excluded, use the `cmd/include/before` or `cmd/include/after` hooks.

## 1.5 High-level interfaces for L<sup>A</sup>T<sub>E</sub>X

We do not provide any additional wrappers around the hooks (like `filehook` or `scrlfile`) because we believe that for package writers the high-level commands from the hook management, e.g., `\AddToHook`, etc. are sufficient and in fact easier to work with, given that the hooks have consistent naming conventions.

---

<sup>41</sup>For that reason another `\clearpage` is executed after these hooks which normally does nothing, but starts a new page if further material got added this way.

## 1.6 Internal interfaces for L<sup>A</sup>T<sub>E</sub>X

---

```
\declare@file@substitution \declare@file@substitution {{file}} {{replacement-file}}
\undeclare@file@substitution \undeclare@file@substitution {{file}}
```

---

If  $\langle file \rangle$  is requested for loading replace it with  $\langle replacement-file \rangle$ .  $\text{\CurrentFile}$  remains pointing to  $\langle file \rangle$  but  $\text{\CurrentFileUsed}$  will show the file actually loaded.

The main use case for this declaration is to provide a corrected version of a package that can't be changed (due to its license) but no longer functions because of L<sup>A</sup>T<sub>E</sub>X kernel changes, for example, or to provide a version that makes use of new kernel functionality while the original package remains available for use with older releases.

The  $\text{\undeclare@file@substitution}$  declaration undoes a substitution made earlier.

*Please do not misuse this functionality and replace a file with another unless if really needed and only if the new version is implementing the same functionality as the original one!*

---

```
\disable@package@load \disable@package@load {{package}} {{alternate-code}}
\reenable@package@load \reenable@package@load {{package}}
```

---

If  $\langle package \rangle$  is requested do not load it but instead run  $\langle alternate-code \rangle$  which could issue a warning, error or any other code.

The main use case is for classes that want to restrict the set of supported packages or contain code that make the use of some packages impossible. So rather than waiting until the document breaks they can set up informative messages why certain packages are not available.

The function is only implemented for packages not for arbitrary files.

## 1.7 A sample package for structuring the log output

As an application we provide the package `structuredlog` that adds lines to the `.log` when a file is opened and closed for reading keeping track of nesting level as well. For example, for the current document it adds the lines

```
= (LEVEL 1 START) t1lmr.fd
= (LEVEL 1 STOP) t1lmr.fd
= (LEVEL 1 START) supp-pdf.mkii
= (LEVEL 1 STOP) supp-pdf.mkii
= (LEVEL 1 START) nameref.sty
== (LEVEL 2 START) refcount.sty
== (LEVEL 2 STOP) refcount.sty
== (LEVEL 2 START) gettitlestring.sty
== (LEVEL 2 STOP) gettitlestring.sty
= (LEVEL 1 STOP) nameref.sty
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.out
= (LEVEL 1 STOP) ltfilehook-doc.out
= (LEVEL 1 START) ltfilehook-doc.hd
```

```

= (LEVEL 1 STOP) ltfilehook-doc.hd
= (LEVEL 1 START) ltfilehook.dtx
== (LEVEL 2 START) ot1lmr.fd
== (LEVEL 2 STOP) ot1lmr.fd
== (LEVEL 2 START) omllmm.fd
== (LEVEL 2 STOP) omllmm.fd
== (LEVEL 2 START) omslmsy.fd
== (LEVEL 2 STOP) omslmsy.fd
== (LEVEL 2 START) omxmlmex.fd
== (LEVEL 2 STOP) omxmlmex.fd
== (LEVEL 2 START) umsa.fd
== (LEVEL 2 STOP) umsa.fd
== (LEVEL 2 START) umsb.fd
== (LEVEL 2 STOP) umsb.fd
== (LEVEL 2 START) ts1lmr.fd
== (LEVEL 2 STOP) ts1lmr.fd
== (LEVEL 2 START) t1lmss.fd
== (LEVEL 2 STOP) t1lmss.fd
= (LEVEL 1 STOP) ltfilehook.dtx

```

Thus if you inspect an issue in the .log it is easy to figure out in which file it occurred, simply by searching back for LEVEL and if it is a STOP then remove 1 from the level value and search further for LEVEL with that value which should then be the START level of the file you are in.

## 2 The Implementation

```

1 {*2ekernel}
2 {@@=filehook}

```

### 2.1 Document and package-level commands

`\CurrentFile`  
`\CurrentFilePath`  
`\CurrentFileUsed`  
`\CurrentFilePathUsed`

User-level macros that hold the current file name and file path. These are used internally as well because the code takes care to protect against a possible redefinition of these macros in the loaded file (it's necessary anyway to make hooks work with nested `\input`). The versions `\...Used` hold the *actual* file name and path that is loaded by L<sup>A</sup>T<sub>E</sub>X, whereas the other two hold the name as requested. They will differ in case there's a file substitution.

```

3 {/2ekernel}
4 {*2ekernel | latexrelease}
5 {latexrelease}\IncludeInRelease{2020/10/01}%
6 {latexrelease} {\CurrentFile}{Hook management file}%
7 \ExplSyntaxOn
8 \tl_new:N \CurrentFile
9 \tl_new:N \CurrentFilePath
10 \tl_new:N \CurrentFileUsed
11 \tl_new:N \CurrentFilePathUsed
12 \ExplSyntaxOff
13 {/2ekernel | latexrelease}
14 {latexrelease}\EndIncludeInRelease

```

```

15 \langle latexrelease\rangle\IncludeInRelease{0000/00/00}%
16 \langle latexrelease\rangle {\CurrentFile}{Hook management file}%
17 \langle latexrelease\rangle
18 \langle latexrelease\rangle\let \CurrentFile \@undefined
19 \langle latexrelease\rangle\let \CurrentFilePath \@undefined
20 \langle latexrelease\rangle\let \CurrentFileUsed \@undefined
21 \langle latexrelease\rangle\let \CurrentFilePathUsed \@undefined
22 \langle latexrelease\rangle
23 \langle latexrelease\rangle\EndIncludeInRelease
24 {*2ekernel}

```

(End definition for `\CurrentFile` and others. These functions are documented on page 877.)

## 2.2 `expl3` helpers

```

25 {/2ekernel}
26 {*2ekernel | latexrelease}
27 \langle latexrelease\rangle\IncludeInRelease{2020/10/01}%
28 \langle latexrelease\rangle {__filehook_file_parse_full_name:nN}{File helpers}%
29 \ExplSyntaxOn

```

`\_filehook_file_parse_full_name:nN`  
`\_\_filehook_full_name:nn`

A utility macro to trigger `expl3`'s file-parsing and lookup, and return a normalized representation of the file name. If the queried file doesn't exist, no normalization takes place. The output of `\_\_filehook_file_parse_full_name:nN` is passed on to the #2—a 3-argument macro that takes the `\path`, `\base`, and `\ext` parts of the file name.

```

30 \cs_new:Npn __filehook_file_parse_full_name:nN #1
31 {
32 \exp_args:Nf \file_parse_full_name_apply:nn
33 {
34 \exp_args:Nf __filehook_full_name:nn
35 { \file_full_name:n {#1} } {#1}
36 }
37 }
38 \cs_new:Npn __filehook_full_name:nn #1 #2
39 {
40 \tl_if_empty:nTF {#1}
41 { \tl_trim_spaces:n {#2} }
42 { \tl_trim_spaces:n {#1} }
43 }

```

(End definition for `\_\_filehook_file_parse_full_name:nN` and `\_\_filehook_full_name:nn`.)

`\_\_filehook_if_no_extension:nTF`  
`\_\_filehook_drop_extension:N`

Some actions depend on whether the file extension was explicitly given, and sometimes the extension has to be removed. The macros below use `\_\_filehook_file_parse_full_name:nN` to split up the file name and either check if `\ext` (#3) is empty, or discard it.

```

44 \cs_new:Npn __filehook_if_no_extension:nTF #1
45 {
46 \exp_args:Ne \tl_if_empty:nTF
47 { \file_parse_full_name_apply:nN {#1} \use_iii:nnn }
48 }
49 \cs_new_protected:Npn __filehook_drop_extension:N #1
50 {
51 \tl_gset:Nx #1

```

```

52 {
53 \exp_args:NV __filehook_file_parse_full_name:nN #1
54 __filehook_drop_extension_aux:nnn
55 }
56 }
57 \cs_new:Npn __filehook_drop_extension_aux:nnn #1 #2 #3
58 { \tl_if_empty:nF {#1} { #1 / } #2 }

```

(End definition for `\__filehook_if_no_extension:nTF` and `\__filehook_drop_extension:N`.)

```

\g__filehook_input_file_seq
\l__filehook_internal_tl
__filehook_file_push:
__filehook_file_pop:
__filehook_file_pop_assign:nnnn

```

Yet another stack, to keep track of `\CurrentFile` and `\CurrentFilePath` with nested `\inputs`. At the beginning of `\InputIfFileExists`, the current value of `\CurrentFilePath` and `\CurrentFile` is pushed to `\g__filehook_input_file_seq`, and at the end, it is popped and the value reassigned. Some other places don't use `\InputIfFileExists` directly (`\include`) or need `\CurrentFile` earlier (`\@onefilewithoptions`), so these are manually used elsewhere as well.

```

59 \tl_new:N \l__filehook_internal_tl
60 \seq_if_exist:NF \g__filehook_input_file_seq
61 { \seq_new:N \g__filehook_input_file_seq }

## 2.3 Declaring the file-related hooks

These hooks have names with three-parts that start with `file/`, `include/`, `class/` or `package/` and end with `/before` or `/after` (or `/end` in the case of `include/`). They are all generic hooks so will be declared only if code is added to them; this declaration is done for you automatically and, indeed, they should not be declared explicitly.

Those named `.../after` and `include/.../end` are, when code is added, declared as reversed hooks.

## 2.4 Patching L<sup>A</sup>T<sub>E</sub>X's \InputIfFileExists command

Most of what we have to do is adding `\UseHook` into several L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  core commands, because of some circular dependencies in the kernel we do this only now and not in `ltfiles`.

```
\InputIfFileExists \InputIfFileExists loads any file if it is available so we have to add the hooks
@input@file@exists@with@hooks file/before and file/after in the right places. If the file doesn't exist no hooks
\unqu@tfilef@und should be executed.
```

```
143 </2ekernel>
144 <latexrelease>\IncludeInRelease{2020/10/01}%
145 <latexrelease> {\InputIfFileExists}{Hook management (files)}%
146 <*2ekernel | latexrelease>

147 \let\InputIfFileExists@\undefined
148 \DeclareRobustCommand \InputIfFileExists[2]{%
149 \IfFileExists{#1}%
150 {%
151 \@expl@@@filehook@file@push@@
152 \@filehook@set@CurrentFile
```

We pre-expand `\@filef@und` so that in case another file is loaded in the true branch of `\InputIfFileExists`, these don't change their value meanwhile. This isn't a worry with `\CurrentFile...` because they are kept in a stack.

```
153 \expandafter\@swaptwoargs\expandafter
154 {\expandafter\@input@file@exists@with@hooks
155 \expandafter{\@filef@und}}%
156 {#2}%
157 \@expl@@@filehook@file@pop@@
158 }%
159 }
160 \def\@input@file@exists@with@hooks#1{%
```

If the file exists then `\CurrentFile` holds its name. But we can't rely on that still being true after the file has been processed. Thus for using the name in the file hooks we need to preserve the name and then restore it for the `file/.../after` hook.

The hook always refers to the file requested by the user. The hook is *always* loaded for `\CurrentFile` which usually is the same as `\CurrentFileUsed`. In the case of a file replacement, the `\CurrentFileUsed` holds the actual file loaded. In any case the file names are normalized so that the hooks work on the real file name, rather than what the user typed in.

`\expl3`'s `\file_full_name:n` normalizes the file name (to factor out differences in the `.tex` extension), and then does a file lookup to take into account a possible path from `\l_file_search_path_seq` and `\input@path`. However only the file name and extension

are returned so that file hooks can refer to the file by their name only. The path to the file is returned in `\CurrentFilePath`.

```

161 \edef\reserved@a{%
162 \@expl@@@filehook@file@pop@assign@nnnn
163 {\CurrentFilePathUsed}%
164 {\CurrentFileUsed}%
165 {\CurrentFilePath}%
166 {\CurrentFile}}%
167 \expandafter\swaptwoargs\expandafter{\reserved@a}%

```

Before adding to the file list we need to make all (letter) characters catcode 11, because several packages use constructions like

```

\filename@parse{<filename>}
\ifx\filename@ext\clsextension
 ...
\fi

```

and that doesn't work if `\filename@ext` is `\detokenized`. Making `\clsextension` a string doesn't help much because some packages define their own `\<prefix>@someextension` with normal catcodes. This is not entirely correct because packages loaded (somehow) with catcode 12 alphabetic tokens (say, as the result of a `\string` or `\detokenize` command, or from a `\TeX` string like `\jobname`) will have these character tokens incorrectly turned into letter tokens. This however is rare, so we'll go for the all-letters approach (grepping the packages in `\TeX` Live didn't bring up any obvious candidate for breaking with this catcode change).

```

168 {\edef\reserved@a{\unqu@tefilef@und#1\@nil}%
169 \@addtofilelist{\string\makeletter\reserved@a}%
170 \UseHook{file/before}}%

```

The current file name is available in `\CurrentFile` so we use that in the specific hook.

```

171 \UseHook{file/\CurrentFile/before}%
172 \@@input #1% <- trailing space comes from \@filef@und
173 }%

```

And here, `\CurrentFile` is restored (by `\@expl@@@filehook@file@pop@assign@nnnn`) so we can use it once more.

```

174 \UseHook{file/\CurrentFile/after}%
175 \UseHook{file/after}%

## 2.6 Selecting a file (`\set@curr@file`)

```
\set@curr@file
\set@curr@file@nosearch
 @curr@file
 @curr@file@reqd
```

Now we hook into `\set@curr@file` to resolve a possible file substitution, and add `\Expl@@@filehook@set@curr@file@@nNN` at the end, after `\curr@file` is set.

A file name is built using `\expandafter\string\csname<filename>\endcsname` to avoid expanding utf8 active characters. The `\csname` expands the normalization machinery and the routine to resolve a file substitution, returning a control sequence with the same name as the file.

It happens that when `<filename>` is empty, the generated control sequence is `\csname\endcsname`, and doing `\string` on that results in the file `csnameendcsname.tex`. To guard against that we `\ifx`-compare the generated control sequence with the empty `csname`. To do so, `\csname\endcsname` has to be defined, otherwise it would be equal to `\relax` and we would have false positives. Here we define `\csname\endcsname` to expand to itself to avoid it matching the definition of some other control sequence.

```

284 \expandafter\def\csname\expandafter\endcsname
285 \expandafter{\csname\endcsname}}%
```

Two file names are set here: `@curr@file@reqd` which is the file requested by the user, and `@curr@file` which should be the same, except when we have a file substitution, in which case it holds the actual loaded file. `@curr@file` is resolved first, to check if a substitution happens. If it doesn't, `\Expl@@@filehook@if@file@replaced@@TF` short-cuts and just copies `@curr@file`, otherwise the full normalization procedure is executed.

At this stage the file name is parsed and normalized, but if the input doesn't have an extension, the default `.tex` is *not* added to `@curr@file` because for applications other than `\input` (graphics, for example) the default extension may not be `.tex`. First check if the input has an extension, then if the input had no extension, call `\Expl@@@filehook@drop@extension@@N`. In case of a file substitution, `@curr@file` will have an extension.

```

```
flag_U_filehook_file_replaced
 _filehook_if_file_replaced:TF
 _filehook_clear_replacement_flag:
```

Since the file replacement is done expandably in a `\csname`, use a flag to remember if a substitution happened. We use this in `\set@curr@file` to short-circuit some of it in case no substitution happened (by far the most common case, so it's worth optimizing). The flag raised during the file substitution algorithm must be explicitly cleared after the `\__filehook_if_file_replaced:TF` conditional is no longer needed, otherwise further uses of `\__filehook_if_file_replaced:TF` will wrongly return true.

```
418 \flag_new:n { __filehook_file_replaced }
419 \cs_new:Npn __filehook_if_file_replaced:TF #1 #2
420 { \flag_if_raised:nTF { __filehook_file_replaced } {#1} {#2} }

422 { \flag_clear:n { __filehook_file_replaced } }
```

\\_filehook\\_file\\_subst\\_begin:nnn

First off, start by checking if the current file (`(name) + (ext)`) has a declared substitution. If not, then just put that as the name (including a possible `(path)` in this case): this is the default case with no substitutions, so it's the first to be checked. The auxiliary `\_filehook\_file\_subst\_tortoise\_hare:nn` sees that there's no replacement for #2#3 and does nothing else.

```
423 \cs_new:Npn __filehook_file_subst_begin:nnn #1 #2 #3
424 {
425 __filehook_file_subst_tortoise_hare:nn { #2#3 } { #2#3 }
426 { __filehook_file_name_compose:nnn {#1} {#2} {#3} }
427 }
428 \ExplSyntaxOff
429 ⟨/2ekernel | latexrelease⟩
430 ⟨latexrelease⟩\EndIncludeInRelease
431 ⟨*2ekernel⟩
```

### 2.7.1 The Tortoise and Hare algorithm

If there is a substitution (`<true>` in the first `\cs_if_exist:cTF` below), then first check if there is no substitution down the line: this should be the second most common case, of one file replaced by another. In that case just leave the substitution there and the job is done. If any substitution happens, then the `\flag __filehook_file_replaced` is raised (conditionally, because checking if a flag is raised is much faster than raising it over and over again).

If, however there are more substitutions, then we need to check for a possible loop in the substitutions, which would otherwise put TeX in an infinite loop if just an exhaustive expansion was used.

To detect a loop, the *Tortoise and Hare* algorithm is used. The name of the algorithm is an analogy to Aesop's fable, in which the Hare outruns a Tortoise. The two pointers here are the csnames which contains each file replacement, both of which start at the position zero, which is the file requested. In the inner part of the macro below, `\_filehook_file_subst_loop:cc` is called with `\@file-subst@<file>` and `\@file-subst@\@file-subst@<file>`; that is, the substitution of `<file>` and the substitution of that substitution: the Tortoise walks one step while the Hare walks two.

Within `\__filehook_file_subst_loop:NN` the two substitutions are compared, and if they lead to the same file it means that there is a loop in the substitutions. If there's

no loop, `\__filehook_file_subst_tortoise_hare:nn` is called again with the Tortoise at position 1 and the hare at 2. Again, the substitutions are checked ahead of the Hare pointer to check that it won't run too far; in case there is no loop in the declarations, eventually one of the `\cs_if_exist:cTF` below will go `<false>` and the algorithm will end; otherwise it will run until the Hare reaches the same spot as the tortoise and a loop is detected.

```

432 </2ekernel>
433 <*2ekernel | latexrelease>
434 <latexrelease>\IncludeInRelease{2020/10/01}%
435 <latexrelease> {__filehook_file_subst_tortoise_hare:nn}{Tortoise and Hare}%
436 \ExplSyntaxOn
437 \cs_new:Npn __filehook_file_subst_tortoise_hare:nn #1 #2 #3
438 {
439 \cs_if_exist:cTF { @file-subst@ #2 }
440 {
441 \flag_if_raised:nF { __filehook_file_replaced }
442 { \flag_raise:n { __filehook_file_replaced } }
443 \cs_if_exist:cTF { @file-subst@ \use:c { @file-subst@ #2 } }
444 {
445 __filehook_file_subst_loop:cc
446 { @file-subst@ #1 }
447 { @file-subst@ \use:c { @file-subst@ #2 } }
448 }
449 { \use:c { @file-subst@ #2 } }
450 }
451 { #3 }
452 }

```

This is just an auxiliary to check if a loop was found, and continue the algorithm otherwise. If a loop is found, the .tex file is used as fallback and `\__filehook_file_subst_cycle_error:cN` is called to report the error.

```

453 \cs_new:Npn __filehook_file_subst_loop:NN #1 #2
454 {
455 \token_if_eq_meaning:NNTF #1 #2
456 {
457 .tex
458 __filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #1
459 }
460 { __filehook_file_subst_tortoise_hare:nn {#1} {#2} {#2} }
461 }
462 \cs_generate_variant:Nn __filehook_file_subst_loop:NN { cc }

```

Showing this type of error expandably is tricky, as we have a very limited amount of characters to show and a potentially large list. As a work around, several errors are printed, each showing one step of the loop, until all the error messages combined show the loop.

```

463 \cs_new:Npn __filehook_file_subst_cycle_error:NN #1 #2
464 {
465 \msg_expandable_error:nnff { latex2e } { file-cycle }
466 {#1} { \use:c { @file-subst@ #1 } }
467 \token_if_eq_meaning:NNF #1 #2
468 { __filehook_file_subst_cycle_error:cN { @file-subst@ #1 } #2 }
469 }

```

```
470 \cs_generate_variant:Nn __filehook_file_subst_cycle_error:NN { c }
 And the error message:
471 \msg_new:nnn { latex2e } { file-cycle }
472 { File~loop!~#1~replaced~by~#2... }
(End definition for __filehook_resolve_file_subst:w and others.)
473 \ExplSyntaxOff
474 </2ekernel | latexrelease>

499 〈*2ekernel〉

```

(End definition for \disable@package@load, \reenable@package@load, and  
\@disable@packageload@do. These functions are documented on page 880.)

## 2.9 High-level interfaces for L<sup>A</sup>T<sub>E</sub>X

None so far and the general feeling for now is that the hooks are enough. Packages like filehook, etc., may use them to set up their interfaces (samples are given below) but for the now the kernel will not provide any.

## 2.10 Internal commands needed elsewhere

Here we set up a few horrible (but consistent) L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  names to allow for internal commands to be used outside this module (and in parts that still use L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  syntax). We have to unset the @@ since we want double “at” sign in place of double underscores.

```

```

### 3 A sample package for structuring the log output

```
536 {*structuredlog}
537 <@=filehook>
538 \ProvidesExplPackage
539 {structuredlog}{\ltfilehookdate}{\ltfilehookversion}
540 {Structuring the TeX transcript file}

\g_filehook_nesting_level_int
Stores the current package nesting level.

541 \int_new:N \g_filehook_nesting_level_int
Initialise the counter with the number of files in the \currnamestack (the number of items divided by 3) minus one, because this package is skipped when printing to the log.

542 \int_gset:Nn \g_filehook_nesting_level_int
543 { (\tl_count:N \currnamestack) / 3 - 1 }

(End definition for \g_filehook_nesting_level_int.)
```

\\_filehook\_log\_file\_record:n This macro is responsible for increasing and decreasing the file nesting level, as well as printing to the log. The argument is either STOPTART or STOP and the action it takes on the nesting integer depends on that.

```
544 \cs_new_protected:Npn _filehook_log_file_record:n #1
545 {
546 \str_if_eq:nnT {#1} {START} { \int_gincr:N \g_filehook_nesting_level_int }
547 \iow_term:x
548 {
549 \prg_replicate:nn { \g_filehook_nesting_level_int } { = } ~
550 (LEVEL ~ \int_use:N \g_filehook_nesting_level_int \c_space_tl #1) ~
551 \CurrentFileUsed
```

If there was a file replacement, show that as well:

```
552 \str_if_eq:NNF \CurrentFileUsed \CurrentFile
553 { ~ (\CurrentFile \c_space_tl requested) }
554 \iow_newline:
555 }
556 \str_if_eq:nnT {#1} {STOP} { \int_gdecr:N \g_filehook_nesting_level_int }
557 }
```

Now just hook the macro above in the generic `file/before...`

```
558 \AddToHook{file/before}{ _filehook_log_file_record:n { START } }
```

...and `file/after` hooks. We don't want to install the `file/after` hook immediately, because that would mean it is the first time executed when the package finishes. We therefore put the declaration inside `\AddToHookNext` so that it gets only installed when we have left this package.

```
559 \AddToHookNext{file/after}
560 { \AddToHook{file/after}{ _filehook_log_file_record:n { STOP } } }
```

(End definition for \\_filehook\_log\_file\_record:n.)

```
561 <@=/
562
```

## 4 Package emulations

### 4.1 Package **atveryend** emulation

With the new hook management and the hooks in \enddocument all of atveryend is taken care of. We can make an emulation only here after the substitution functionality is available:

```
563 {*2ekernel}
564 \declare@file@substitution{atveryend.sty}{atveryend-ltx.sty}
565 /2ekernel}
```

Here is the package file we point to:

```
566 {*atveryend-ltx}
567 \ProvidesPackage{atveryend-ltx}
568 [2020/08/19 v1.0a
569 Emulation of the original atveryend package^^Jwith kernel methods]
```

Here are new definitions for its interfaces now pointing to the hooks in \enddocument

```
570 \newcommand\AfterLastShipout {\AddToHook{\enddocument/afterlastpage}}
571 \newcommand\AtVeryEndDocument {\AddToHook{\enddocument/afteraux}}
```

Next one is a bit of a fake, but the result should normally be as expected. If not, one needs to add a rule to sort the code chunks in enddocument/info.

```
572 \newcommand\AtEndAfterFileList{\AddToHook{\enddocument/info}}
573 \newcommand\AtVeryVeryEnd {\AddToHook{\enddocument/end}}
```

\BeforeClearDocument This one is the only one we don't implement or rather don't have a dedicated hook in the code.

```
574 \ExplSyntaxOn
575 \newcommand\BeforeClearDocument[1]
576 { \AtEndDocument{#1}
577 \atveryend@DEPRECATED{BeforeClearDocument \tl_to_str:n{#1}}
578 }
579 \cs_new:Npn\atveryend@DEPRECATED #1
580 { \iow_term:x{=====DEPRECATED~USAGE~#1=====}}
581 \ExplSyntaxOff
(End definition for \BeforeClearDocument.)
582 /atveryend-ltx
```

# File X

## ltshipout.dtx

### 1 Introduction

The code provides an interface to the `\shipout` primitive of T<sub>E</sub>X which is called when a finished pages is finally “shipped out” to the target output file, e.g., the `.dvi` or `.pdf` file. A good portion of the code is based on ideas by Heiko Oberdiek implemented in his packages `atbegshi` and `atenddvi` even though the interfaces are somewhat different.<sup>42</sup>

#### 1.1 Overloading the `\shipout` primitive

---

`\shipout` With this implementation T<sub>E</sub>X’s shipout primitive is no longer available for direct use. Instead `\shipout` is running some (complicated) code that picks up the box to be shipped out regardless of how that is done, i.e., as a constructed `\vbox` or `\hbox` or as a box register.

It then stores it in a named box register. This box can then be manipulated through a set of hooks after which it is shipped out for real.

Each shipout that actually happens (i.e., where the material is not discarded for one or the other reason) is recorded and the total number is available in a readonly variable and in a L<sup>A</sup>T<sub>E</sub>X counter.

---

`\RawShipout` This command implements a simplified shipout that bypasses the foreground and background hooks, e.g., only `shipout/firstpage` and `shipout/lastpage` are executed and the total shipout counters are incremented.

The command doesn’t use `\ShipoutBox` but its own private box register so that it can be used inside of shipout hooks to do some additional shipouts while already in the output routine with the current page being stored in `\ShipoutBox`. It does have access to `\ShipoutBox` if it is used in `shipout/before` (or `shipout/after`) and can use its content.

It is safe to use it in `shipout/before` or `shipout/after` but not necessarily in the other `shipout/...` hooks as they are intended for special processing.

---

<sup>42</sup>Heiko’s interfaces are emulated by the kernel code, if a document requests his packages, so older documents will continue to work.

---

`\ShipoutBox`  
`\l_shipout_box`

This box register is called `\ShipoutBox` (alternatively available via the L3 name `\l_`-`\shipout_box`).

This box is a “local” box and assignments to it should be done only locally. Global assignments (as done by some packages with older code where this is box is known as 255) may work but they are conceptually wrong and may result in errors under certain circumstances.

During the execution of `shipout/before` this box contains the accumulated material for the page, but not yet any material added by other shipout hooks. During execution of `shipout/after`, i.e., after the shipout has happened, the box also contains any background or foreground material.

Material from the hooks `shipout/firstpage` or `shipout/lastpage` is not included (but only used during the actual shipout) to facilitate reuse of the box data (e.g., `shipout/firstpage` material should never be added to a later page of the output).

---

`\l_shipout_box_ht_dim`  
`\l_shipout_box_dp_dim`  
`\l_shipout_box_wd_dim`  
`\l_shipout_box_ht_plus_dp_dim`

The shipout box dimensions are available in the L3 registers `\l_shipout_box_ht_dim`, etc. (there are no L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> names).<sup>43</sup> These variables can be used inside the hook code for `shipout/before`, `shipout/foreground` and `shipout/background` if needed.

## 1.2 Provided hooks

---

`shipout/before`  
`shipout/after`  
`shipout/foreground`  
`shipout/background`  
`shipout/firstpage`  
`shipout/lastpage`

The code for `\shipout` offers a number of hooks into which packages (or the user) can add code to support different use cases. These are:

`shipout/before` This hook is executed after the finished page has been stored in `\ShipoutBox` / `\l_shipout_box`). It can be used to alter that box content or to discard it completely (see `\DiscardShipoutBox` below).

You can use `\RawShipout` inside this hook for special use cases. It can make use of `\ShipoutBox` (which doesn’t yet include the background and foreground material).

**Note:** It is not possible (or say advisable) to try and use this hook to typeset material with the intention to return it to main vertical list, it will go wrong and give unexpected results in many cases—for starters it will appear after the current page not before or it will vanish or the vertical spacing will be wrong!

`shipout/background` This hook adds a picture environment into the background of the page with the (0,0) coordinate in the top-left corner using a `\unitlength` of 1pt.

It should therefore only receive `\put` commands or other commands suitable in a `picture` environment and the vertical coordinate values would normally be negative.

---

<sup>43</sup>Might need changing, but HO’s version as strings is not really helpful I think).

Technically this is implemented by adding a zero-sized `\hbox` as the very first item into the `\ShipoutBox` containing that `picture` environment. Thus the rest of the box content will overprint what ever is typeset by that hook.

**shipout/foreground** This hook adds a picture environment into the foreground of the page with the  $(0,0)$  coordinate in the top-left corner using a `\unitlength` of `1pt`.

Technically this is implemented by adding a zero-sized `\hbox` as the very last item into the `\ShipoutBox` and raising it up so that it still has its  $(0,0)$  point in the top-left corner. But being placed after the main box content it will be typeset later and thus overprints it (i.e., is in the foreground).

**shipout/firstpage** The material from this hook is executed only once at the very beginning of the first output page that is shipped out (i.e., not discarded at the last minute). It should only contain `\special` or similar commands needed to direct post processors handling the `.dvi` or `.pdf` output.<sup>44</sup>

This hook is added to the very first page regardless of how it is shipped out (i.e., with `\shipout` or `\RawShipout`).

**shipout/lastpage** The corresponding hook to add `\specials` at the very end of the output file. It is only executed on the very last page of the output file — or rather on the page that `LATEX` believes is the last one. Again it is executed regardless of the `shipout` method.

It may not be possible for `LATEX` to correctly determine which page is the last one without several reruns. If this happens and the hook is non-empty then `LATEX` will add an extra page to place the material and also request a rerun to get the correct placement sorted out.

**shipout/after** This hook is executed after a shipout has happened. If the shipout box is discarded this hook is not looked at.

You can use `\RawShipout` inside this hook for special use cases and the main `\ShipoutBox` is still available at this point (but in contrast to `shipout/before` it now includes the background and foreground material).

**Note:** Just like `shipout/before` this hook is not meant to be used for adding typeset material back to the main vertical list—it might vanish or the vertical spacing will be wrong!

As mentioned above the hook `shipout/before` is executed first and can manipulate the prepared shipout box stored in `\ShipoutBox` or set things up for use in `\write` during the actual shipout. It is even run if there was a `\DiscardShipoutBox` request in the document.

The other hooks (except `shipout/after`) are added inside `hboxes` to the box being shipped out in the following order:

|                                                   |                        |
|---------------------------------------------------|------------------------|
| <code>shipout/firstpage</code>                    | only on the first page |
| <code>shipout/background</code>                   |                        |
| <code>&lt;boxed content of \ShipoutBox&gt;</code> |                        |
| <code>shipout/foreground</code>                   |                        |
| <code>shipout/lastpage</code>                     | only on the last page  |

---

<sup>44</sup>In `LATEX 2ε` that was already existing, but implemented using a box register with the name `\@begindvbox`.

If any of the hooks has no code then that particular no box is added at that point.

Once the (page) box has been shipped out the `shipout/after` hook is called (while you are still inside the output routine). It is not called if the shipout box was discarded.

In a document that doesn't produce pages, e.g., only makes \typeouts, none of the hooks are ever executed (as there is no `\shipout`) not even the `shipout/lastpage` hook.

If `\RawShipout` is used instead of `\shipout` then only the hooks `shipout/firstpage` and `shipout/lastpage` are executed (on the first or last page), all others are bypassed.

### 1.3 Legacy L<sup>A</sup>T<sub>E</sub>X commands

---

```
\AtBeginDvi \AtBeginDvi {<code>}
\AtEndDvi
```

`\AtBeginDvi` is the existing L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> interface to fill the `shipout/firstpage` hook. This is not really a good name as it is not just supporting `.dvi` but also `.pdf` output or `.xdv`.

`\AtEndDvi` is the counterpart that was not available in the kernel but only through the package `atenddvi`. It fills the `shipout/lastpage` hook.

Neither interface can set a code label but uses the current default label.

As these two wrappers have been available for a long time we continue offering them (but not enhancing them, e.g., by providing support for code labels).

For new code we strongly suggest using the high-level hook management commands directly instead of "randomly-named" wrappers. This will lead to code that is easier to understand and to maintain and it also allows you to set code labels if needed.

For this reason we do not provide any other "new" wrapper commands for the above hooks in the kernel, but only keep the existing ones for backward compatibility.

### 1.4 Special commands for use inside the hooks

---

```
\DiscardShipoutBox \AddToHookNext {shipout/before} {...\DiscardShipoutBox...}
\shipout_discard:
```

The `\DiscardShipoutBox` declaration (L3 name `\shipout_discard:`) requests that on the next shipout the page box is thrown away instead of being shipped to the `.dvi` or `.pdf` file.

Typical applications wouldn't do this unconditionally, but have some processing logic that decides to use or not to use the page.

Note that if this declaration is used directly in the document it may depend on the placement to which page it applies, given that L<sup>A</sup>T<sub>E</sub>X output routine is called in an asynchronous manner! Thus normally one would use this only as part of the `shipout/before` code.

*Todo: Once we have a new mark mechanism available we can improve on that and make sure that the declaration applies to the page that contains it.*

In the `atbegshi` package there are a number of additional commands for use inside the `shipout/before` hook. They should normally not be needed any more as one can instead simply add code to the hooks `shipout/before`, `shipout/background` or `shipout/foreground`.<sup>45</sup> If `atbegshi` gets loaded then those commands become available as public functions with their original names as given below.

---

<sup>45</sup>If that assumption turns out to be wrong it would be trivial to change them to public functions (right now they are private).

## 1.5 Provided $\text{\LaTeX}$ callbacks

---

`pre_shipout_filter` Under  $\text{\LaTeX}$  the `pre_shipout_filter` Lua callback is provided which gets called immediately before the shipout primitive gets invoked. The signature is

```
function(<node> head)
 return true
end
```

The `head` is the list node corresponding to the box to be shipped out. The return value should always be `true`.

## 1.6 Information counters

---

`\ ReadonlyShipoutCounter` `\ifnum\ ReadonlyShipoutCounter=...`  
`\g_shipout_READONLY_int` `\int_use:N \g_shipout_READONLY_int % expl3 usage`

This integer holds the number of pages shipped out up to now (including the one to be shipped out when inside the output routine). More precisely, it is incremented only after it is clear that a page will be shipped out, i.e., after the `shipout/before` hook (because that might discard the page)! In contrast `shipout/after` sees the incremented value.

Just like with the `page` counter its value is only accurate within the output routine. In the body of the document it may be off by one as the output routine is called asynchronously!

Also important: it *must not* be set, only read. There are no provisions to prevent that restriction, but if you manipulate it, chaos will be the result. To emphasize this fact it is not provided as a  $\text{\LaTeX}$  counter but as a  $\text{\TeX}$  counter (i.e., a command), so `\Alpha{\ReadonlyShipoutCounter}` etc, would not work.

---

`totalpages` `\arabic{totalpages}`  
`\g_shipout_totalpages_int` `\int_use:N \g_shipout_totalpage_int % expl3 usage`

In contrast to `\ ReadonlyShipoutCounter`, the `totalpages` counter is a  $\text{\LaTeX}$  counter and incremented for each shipout attempt including those pages that are discarded for one or the other reason. Again `shipout/before` sees the counter before it is incremented. In contrast `shipout/after` sees the incremented value.

Furthermore, while it is incremented for each page, its value is never used by  $\text{\LaTeX}$ . It can therefore be freely reset or changed by user code, for example, to additionally count a number of pages that are not build by  $\text{\LaTeX}$  but are added in a later part of the process, e.g., cover pages or picture pages made externally.

Important: as this is a page-related counter its value is only reliable inside the output routine!

---

`\PreviousTotalPages` `\thetotalpages\PreviousTotalPages`

Command that expands to the number of total pages from the previous run. If there was no previous run or if used in the preamble it expands to 0. Note that this is a command and not a counter, so in order to display the number in, say, Roman numerals you have to assign its value to a counter and then use `\Roman` on that counter.

## 1.7 Debugging shipout code

---

```
\DebugShipoutsOn \DebugShipoutsOn
\DebugShipoutsOff \DebugShipoutsOff
\shipout_debug_on: \shipout_debug_on:
\shipout_debug_off: \shipout_debug_off:
```

Turn the debugging of shipout code on or off. This displays changes made to the shipout data structures.

*Todo: This needs some rationalizing and may not stay this way.*

## 2 Emulating commands from other packages

The packages in this section are no longer necessary, but as they are used by other packages, they are emulated when they are explicitly loaded with `\usepackage` or `\RequirePackage`.

Please note that the emulation only happens if the package is explicitly requested, i.e., the commands documented below are not automatically available in the L<sup>A</sup>T<sub>E</sub>X kernel! If you write a new package we suggest to use the appropriate kernel hooks directly instead of loading the emulation.

### 2.1 Emulating `atbegshi`

---

```
\AtBeginShipoutUpperLeft \AddToHook {shipout/before}
\AtBeginShipoutUpperLeftForeground {\dots\AtBeginShipoutUpperLeft{\langle code\rangle}\dots}
```

This adds a `picture` environment into the background of the shipout box expecting `\langle code\rangle` to contain `picture` commands. The same effect can be obtained by simply using kernel features as follows:

```
\AddToHook{shipout/background}{\langle code\rangle}
```

There is one technical difference: if `\AtBeginShipoutUpperLeft` is used several times each invocation is put into its own box inside the shipout box whereas all `\langle code\rangle` going into `shipout/background` ends up all in the same box in the order it is added or sorted based on the rules for the hook chunks.

`\AtBeginShipoutUpperLeftForeground` is similar with the difference that the `picture` environment is placed in the foreground. To model it with the kernel functions use the hook `shipout/foreground` instead.

---

```
\AtBeginShipoutAddToBox \AddToHook {shipout/before} {\dots\AtBeginShipoutAddToBox{\langle code\rangle}\dots}
\AtBeginShipoutAddToBoxForeground
```

These work like `\AtBeginShipoutUpperLeft` and `\AtBeginShipoutUpperLeftForeground` with the difference that `\langle code\rangle` is directly placed into an `\hbox` inside the shipout box and not surrounded by a `picture` environment.

To emulate them using `shipout/background` or `shipout/foreground` you may have to wrap `\langle code\rangle` into a `\put` statement but if the code is not doing any typesetting just adding it to the hook should be sufficient.

---

`\AtBeginShipoutBox` This is the name of the shipout box as `atbegshi` knows it.

---

**\AtBeginShipoutOriginalShipout**

This is the name of the `\shipout` primitive as `atbegshi` knows it. This bypasses all the mechanisms set up by the L<sup>A</sup>T<sub>E</sub>X kernel and there are various scenarios in which it can therefore fail. It should only be used to run existing legacy `atbegshi` code but not in newly developed applications.

The kernel alternative is `\RawShipout` which is integrated with the L<sup>A</sup>T<sub>E</sub>X mechanisms and updates, for example, the `\ ReadonlyShipoutCounter` counter. Please use `\RawShipout` for new code if you want to bypass the before, foreground and background hooks.

---

**\AtBeginShipoutInit** By default `atbegshi` delayed its action until `\begin{document}`. This command was forcing it in an earlier place. With the new concept it does nothing.

---

**\AtBeginShipout** `\AtBeginShipout{\<code>}`  $\equiv$  `\AddToHook{shipout/before}{\<code>}`  
**\AtBeginShipoutNext** `\AtBeginShipoutNext{\<code>}`  $\equiv$  `\AddToHookNext{shipout/before}{\<code>}`

This is equivalent to filling the `shipout/before` hook by either using `\AddToHook` or `\AddToHookNext`, respectively.

---

**\AtBeginShipoutFirst** The `atbegshi` names for `\AtBeginDvi` and `\DiscardShipoutBox`.  
**\AtBeginShipoutDiscard**

## 2.2 Emulating `everyshi`

The `everyshi` package is providing commands to run arbitrary code just before the shipout starts. One point of difference: in the new shipout hooks the page is available as `\ShipoutBox` for inspection of change, one should not manipulate box 255 directly inside `shipout/before`, so old code doing this would change to use `\ShipoutBox` instead of 255 or `\@cclv`.

---

**\EveryShipout** `\EveryShipout{\<code>}`  $\equiv$  `\AddToHook{shipout/before}{\<code>}`

---

**\AtNextShipout** `\AtNextShipout{\<code>}`  $\equiv$  `\AddToHookNext{shipout/before}{\<code>}`

However, most use cases for `everyshi` are attempts to put some picture or text into the background or foreground of the page and that can be done today simply by using the `shipout/background` and `shipout/foreground` hooks without any need to coding.

## 2.3 Emulating `atenddvi`

The `atenddvi` package implemented only a single command: `\AtEndDvi` and that is now available out of the box so the emulation makes the package a no-op.

(End definition for `\shipout_debug_on`: and others. These functions are documented on page 904.)

`\ShipoutBox` The box filled with the page to be shipped out (both L<sup>3</sup> and L<sup>A</sup>T<sub>E</sub>X 2<sub>&</sub> name).  
`\l_shipout_box`

23 `\box_new:N \l_shipout_box`

24 `\cs_set_eq:NN \ShipoutBox \l_shipout_box`

(End definition for `\ShipoutBox` and `\l_shipout_box`. These functions are documented on page 900.)

`\l__shipout_raw_box` The `\RawShipout` gets its own box but it is internal as there is no hook manipulation for it.

25 `\box_new:N \l__shipout_raw_box`

(End definition for `\l__shipout_raw_box`.)

`\__shipout_finalize_box:` For LuaT<sub>E</sub>X invoke the `pre_shipout_filter` callback.

26 `\sys_if_engine_luatex:TF`  
27 {  
28     `\newprotectedluacmd \__shipout_finalize_box:`  
29     `\exp_args:Nx \everyjob {`  
30         `\exp_not:V \everyjob`  
31         `\exp_not:N \lua_now:n {`  
32             `luatexbase.create_callback('pre_shipout_filter', 'list')`  
33             `local~call, getbox, setbox = luatexbase.call_callback, tex.getbox, tex.setbox~`  
34             `lua.get_functions_table()[\the \allocationnumber] = function()`  
35             `local~head = getbox(\the \l_shipout_box)`  
36             `local~result = call('pre_shipout_filter', head)`  
37             `if-not (result == head) then~`  
38                 `setbox(\the \l_shipout_box, result~or~nil)`  
39             `end~`  
40         `end`  
41     }  
42 }  
43 } {  
44     `\cs_set_eq:NN \__shipout_finalize_box: \scan_stop:`  
45 }

(End definition for `\__shipout_finalize_box`.)

`\__shipout_execute:` This is going to be the code run by `\shipout`. The code follows closely the ideas from atbegshi, so not documenting that here for now.

46 `\cs_set_protected:Npn \__shipout_execute: {`  
47     `\tl_set:Nx \l__shipout_group_level_tl`  
48         `{ \int_value:w \tex_currentgrouplevel:D }`  
49     `\tex_afterassignment:D \__shipout_execute_test_level:`  
50     `\tex_setbox:D \l_shipout_box`  
51 }

(End definition for `\__shipout_execute`.)

`\shipout` Overloading the `\shipout` primitive:

52 `\cs_gset_eq:NN \shipout \__shipout_execute:`

(End definition for `\shipout`. This function is documented on page 899.)

\l\_\_shipout\_group\_level\_t1 Helper token list to record the group level at which \\_\\_shipout\\_execute: is encountered.  
 53 \t1\_new:N \l\_\_shipout\_group\_level\_t1  
*(End definition for \l\_\_shipout\_group\_level\_t1.)*

\\_\\_shipout\_execute\\_test\\_level: If the group level has changed then we are still constructing \l\\_shipout\\_box and to continue we need to wait until the current group has finished, hence the \tex\\_aftergroup:D.

```
54 \cs_new:Npn __shipout_execute_test_level: {
 55 \int_compare:nNnT
 56 \l__shipout_group_level_t1 < \tex_currentgrouplevel:D
 57 \tex_aftergroup:D __shipout_execute_cont:
 58 }
```

*(End definition for \\_\\_shipout\_execute\_test\_level:.)*

\\_\\_shipout\_execute\\_cont: This does the actual shipout running several hooks as part of it. The code for them is passed as argument #2 to #4 to \\_\\_shipout\\_execute\_main\\_cont:Nnnn; the first argument is the box to be shipped out.

```
59 \cs_new:Npn __shipout_execute_cont: {
 60 __shipout_execute_main_cont:Nnnn
 \l__shipout_box
 62 { \hook_use:n {shipout/before} }
 63 { \hook_if_empty:nF {shipout/foreground}
 { __shipout_add_foreground_picture:
 { \hook_use:n {shipout/foreground} } } }
```

If the user hook for the background (shipout/background) has no code, there might still code in the kernel hook so we need to test for this too. We only test for the @kernel@before@shipout@background though. If the @kernel@after@shipout@background needs executing even if the user hook is empty then we can add another test (or the kernel could put something into the before hook).

```
66 \bool_lazy_and:nnF
 67 { \hook_if_empty_p:n {shipout/background} }
 68 { \t1_if_empty_p:N \@kernel@before@shipout@background }
 69 { __shipout_add_background_picture:
 { \@kernel@before@shipout@background
 \hook_use:n {shipout/background}
 \@kernel@after@shipout@background } }
 70 }
 71 }
 72 { \hook_use:n {shipout/foreground} }
 73 }
 74 }
 75 { \hook_use:n {shipout/after} }
 76 }
```

*(End definition for \\_\\_shipout\_execute\_cont:.)*

\\_\\_shipout\_execute\_main\\_cont:Nnnn When we have reached this point the shipout box has been processed and is available in \l\\_shipout\\_box and ready for real ship out (unless it gets discarded during the process).

The three arguments hold hook code that is executed just before the actual shipout (#1), within the shipout adding background and foreground material (#2) and after the shipout has happened (#3). These are passed as arguments because the same code without those hooks is also used when doing a “raw” shipout implemented by \RawShipout. The only hook that is always executed is that for the very last page, i.e., shipout/lastpage.

First we quickly check if it is void (can't happen in the standard L<sup>A</sup>T<sub>E</sub>X output routine but `\shipout` might be called from a package that has some special processing logic). If it is void we aren't shipping anything out and processing ends.<sup>46</sup>

```
77 \cs_new:Npn __shipout_execute_main_cont:Nnnn #1#2#3#4 {
78 \box_if_empty:NTF #1
79 { \@latex@warning@no@line{ Ignoring~ void~ shipout~ box } }
80 { }
```

Otherwise we assume that we will ship something and prepare for final adjustments (in particular setting the state of `\protect` while we are running the hook code). We also save the current `\protect` state to restore it later.

```
81 % \bool_gset_false:N \g__shipout_discard_bool % setting this would disable
82 % % \DiscardShipoutBox on doc-level
83 \cs_set_eq:NN __shipout_saved_protect: \protect
84 \set@typeset@protect
```

We also store the current shipout box dimension in registers, so that they can be used in the hook code.<sup>47</sup>

```
85 __shipout_get_box_size:N #1
```

Then we execute the `shipout/before` hook (or nothing in case of `\RawShipout`).

```
86 #2
```

In `\g_shipout_totalpages_int` we count all shipout attempts so we increment that counter already here (the other one is incremented later when we know for sure that we do a `\shipout`).

We increment it after running the above hook so that the values for `\g_shipout_totalpages_int` and `\g_shipout_READONLY_int` are in sync while the hook is executed (in the case that totalpages isn't manually altered or through discarding pages that is).

```
87 \int_gincr:N \g_shipout_totalpages_int
```

The above hook might contain code that requests the page to be discarded so we now test for it.

```
88 \bool_if:NTF \g__shipout_discard_bool
89 { \@latex@info@no@line{Completed~ page~ discarded}
90 \bool_gset_false:N \g__shipout_discard_bool }
```

As we are discarding the page box and not shipping anything out, we need to do some house cleaning and reset T<sub>E</sub>X's deadcycles so that it doesn't complain about too many calls to the OR without any shipout.

```
91 \tex_deadcycles:D \c_zero_int
```

*Todo: In atbegshi the box was dropped but is that actually needed? Or the resetting of `\protect` to its kernel value?*

```
92 % \group_begin:
93 % \box_set_eq_drop:NN #1 #1
94 % \group_end:
95 % \cs_set_eq:NN \protect \exp_not:N
96 }
```

---

<sup>46</sup>In that case we don't reset the deadcycles, that would be up to the OR processing logic to do.

<sup>47</sup>This is not really necessary as the code could access them via `\box_ht:N`, etc., but it is perhaps convenient.

Even if there was no explicit request to discard the box it is possible that the code for the hook `shipout/before` has voided the box (by mistake or deliberately). We therefore test once more but this time make it a warning, because the best practice way is to use the request mechanism.

```

97 { \box_if_empty:NTF #1
98 { \@latex@warning@no@line { Ignoring~ void~ shipout~ box.
99 \MessageBreak The~ shipout~ box~ was~ voided~ by~ hook~ code }
100 }

```

Finally, if the box is still non-empty we are nearly ready to ship it out. First we increment the total page counter so that we can later test if we have reached the final page according to our available information.<sup>48</sup>

```

101 {
102 \int_gincr:N \g_shipout_READONLY_int
103 __shipout_debug:n
104 \typeout{Absolute~ page~ == \int_use:N \g_shipout_READONLY_int
105 \space (target:~ \@abspospage@last)}
106 }

```

Then we store the box sizes again (as they may have changed) and then look at the hooks `shipout/foreground` and `shipout/background`. If either or both are non-empty we add a `picture` environment to the box (in the foreground and/or in the background) and execute the hook code inside that environment.

```
107 __shipout_get_box_size:N #1
```

The first hook we run is the `shipout/firstpage` hook. This is only done once, then the `\__shipout_run_firstpage_hook:` command redefines itself to do nothing. If the hook contains `\specials` for integration at the top of the page they will be temporarily stored in a safe place and added later with `\__shipout_add_firstpage_specials:`.

```
108 __shipout_run_firstpage_hook:
```

Run the hooks for background and foreground or, if this is called by `\RawShipout`, copy the box `\l__shipout_raw_box` to `\l__shipout_box` so that `firstpage` and `lastpage` material gets added if necessary (that is always done to `\l__shipout_box`).

```
109 #3
```

We then run `\__shipout_add_firstpage_specials:` that adds the content of the hook `shipout/firstpage` to the start of the first page (if non-empty). It is then redefined to do nothing on later pages.

```
110 __shipout_add_firstpage_specials:
```

Then we check if we have to add the `shipout/lastpage` hook or the corresponding kernel hook because we have reached the last page. This test will be false for all but one (and hopefully the correct) page.

```

111 \int_compare:nNnT \@abspospage@last = \g_shipout_READONLY_int
112 { \bool_lazy_and:nnF
113 { \hook_if_empty_p:n {shipout/lastpage} }
114 { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
115 { __shipout_debug:n { \typeout{Executing~ lastpage~ hook~
116 on~ page~ \int_use:N \g_shipout_READONLY_int } }
117 __shipout_add_foreground_box:n
118 { \UseHook{shipout/lastpage}

```

---

<sup>48</sup>Doing that earlier would be wrong because we might end up with the last page counted but discarded and then we have no place to add the final objects into the output file.

```

119 \@kernel@after@shipout@lastpage }
120 \bool_gset_true:N \g__shipout_lastpage_handled_bool

```

We record that we have handled the `shipout/lastpage` hook but only if we really did.

```

121 }
122 }
123 __shipout_finalize_box:

```

Finally we run the actual TeX primitive for shipout. As that will expand delayed `\write` statements inside the page in which protected commands should not expand we first change `\protect` to the appropriate definition for that case.

```

124 \cs_set_eq:NN \protect \exp_not:N
125 \tex_shipout:D \box_use:N \l_shipout_box

```

The `\l_shipout_box` may contain the firstpage material if this was the very first shipout. That makes it unsuitable for reuse in another shipout, so as a safety measure the next command resets `\l_shipout_box` to its earlier state if that is necessary. On later pages this is then a no-op.

```

126 __shipout_drop_firstpage_specials:

```

The `shipout/after` hook (if in #4) needs to run with `\protected` commands again being executed, because that hook will “typeset” material added at the top of the next page.

```

127 \set@typeset@protect
128 #4
129 }
130 }

```

Restore the value of `\protect` in case `\shipout` is called outside of the output routine (where it is automatically restored because of the implicit group).

```

131 \cs_set_eq:NN \protect __shipout_saved_protect:
132 }
133 }

```

*(End definition for `\__shipout_execute_main_cont:Nnnn`.)*

`\__shipout_execute_raw:` This implements the “raw” shipout which bypasses the before, foreground, background and after hooks. It follows the same pattern than `\__shipout_execute_raw:` except that it finally calls `\__shipout_execute_main_cont:Nnnn` with three empty arguments, instead of the hook code.

```

134 \cs_set_protected:Npn __shipout_execute_raw: {
135 \tl_set:Nx \l__shipout_group_level_tl
136 { \int_value:w \tex_currentgrouplevel:D }
137 \tex_afterassignment:D __shipout_execute_test_level_raw:
138 \tex_setbox:D \l__shipout_raw_box
139 }
140 \cs_new:Npn __shipout_execute_test_level_raw: {
141 \int_compare:nNnT
142 \l__shipout_group_level_tl < \tex_currentgrouplevel:D
143 \tex_aftergroup:D __shipout_nohooks_cont:
144 }

```

Well, not totally empty arguments, we add some debugging if we are actually doing a shipout.

```

145 \cs_new:Npn __shipout_execute_nohooks_cont: {
146 __shipout_execute_main_cont:Nnnn \l__shipout_raw_box

```

```

147 {} { __shipout_debug:n{ \typeout{Doing~ raw~ shipout~ ...} }
148 \box_set_eq:NN \l_shipout_box \l__shipout_raw_box } {}
149

```

(End definition for `\__shipout_execute_raw:` and `\__shipout_execute_test_level_raw::`)

**\RawShipout** The interface name for raw shipout.

```
150 \cs_gset_eq:NN \RawShipout __shipout_execute_raw:
```

(End definition for `\RawShipout`. This function is documented on page 899.)

`\__shipout_saved_protect:` Remember the current `\protect` state.

```
151 \cs_new_eq:NN __shipout_saved_protect: \protect
```

(End definition for `\__shipout_saved_protect::`)

**shipout/before** Declaring all hooks for the shipout code.

**shipout/after**

**shipout/foreground**

**shipout/background**

**shipout/firstpage**

**shipout/lastpage**

```
152 \hook_new:n{shipout/before}
```

```
153 \hook_new:n{shipout/after}
```

```
154 \hook_new:n{shipout/foreground}
```

```
155 \hook_new:n{shipout/background}
```

```
156 \hook_new:n{shipout/firstpage}
```

```
157 \hook_new:n{shipout/lastpage}
```

(End definition for `shipout/before` and others. These functions are documented on page 900.)

And here are the internal kernel hooks going before or after the public ones where needed.

```

158 \let\@kernel@after@shipout@lastpage\@empty
159 \let\@kernel@before@shipout@background\@empty
160 \let\@kernel@after@shipout@background\@empty

```

(End definition for `\@kernel@after@shipout@lastpage`, `\@kernel@before@shipout@background`, and `\@kernel@after@shipout@background`.)

`\__shipout_run_firstpage_hook:`

There are three commands to handle the `shipout/firstpage` hook: `\__shipout_run_firstpage_hook:`, `\__shipout_add_firstpage_specials:` and `\__shipout_drop_firstpage_specials:`.

That hook is supposed to contain `\specials` and similar material to be placed at the very beginning of the output page and so it needs careful placing to avoid that anything else gets in front of it. And this means we have to wait with this until other hooks such as `shipout/background` have added their bits. It is also important that such `\specials` show up only on the very first page, so if this page gets saved before `\shipout` for later reuse, we have to make sure that they aren't in the saved version.

In addition the hook may also contain code to be executed "first", e.g., visible from code in `shipout/background` and this conflicts with adding the `\specials` late.

Therefore the processing is split into different parts: `\__shipout_run_firstpage_hook:` is done early and checks if there is any material in the hook.

```
161 \cs_new:Npn __shipout_run_firstpage_hook: {
```

```
162 \hook_if_empty:nTF {shipout/firstpage}
```

If not then we define the other two commands to do nothing.

```

163 {
164 \cs_gset_eq:NN __shipout_add_firstpage_specials: \prg_do_nothing:
165 \cs_gset_eq:NN __shipout_drop_firstpage_specials: \prg_do_nothing:
166 }

```

If there is material we execute inside a box, which means any `\special` will end up in that box and any other code is executed and can have side effects (as long as they are global).

```

167 {
168 \hbox_set:Nn \l__shipout_firstpage_box { \UseHook{shipout/firstpage} }
169 }

```

Once we are here we change the definition to do nothing next time and we also change the command used to implement `\AtBeginDvi` to become a warning and not add further material to a hook that is never used again.

```

170 \cs_gset_eq:NN __shipout_run_firstpage_hook: \prg_do_nothing:
171 \cs_gset:Npn __shipout_add_firstpage_material:Nn ##1 ##2 {
172 \@latex@warning{ First~ page~ is~ already~ shipped~ out,~ ignoring
173 \MessageBreak \string##1 }
174 }
175 }

```

*(End definition for `\__shipout_run_firstpage_hook`.)*

`\_shipout add firstpage specials:` The `\__shipout_add_firstpage_specials:` then adds the `\specials` stored in `\l__shipout_firstpage_box` to the page to be shipped out when the time is ready. Note that if there was no material in the `shipout/firstpage` hook then this command gets redefined to do nothing. But for most documents there is something, e.g., some PostScript header, or some meta data declaration, etc. so by default we assume there is something to do.

```
176 \cs_new:Npn __shipout_add_firstpage_specials: {
```

First we make a copy of the `\l_shipout_box` that we can restore it later on.

```
177 \box_set_eq:NN \l__shipout_raw_box \l_shipout_box
```

Adding something to the beginning means adding it to the background as that layer is done first in the output.

```
178 __shipout_add_background_box:n { \hbox_unpack_drop:N \l__shipout_firstpage_box }
```

After the actual shipout `\__shipout_drop_firstpage_specials:` is run to restore the earlier content of `\l_shipout_box` and then redefines itself again to do nothing.

As a final act we change the definition to do nothing next time.

```
179 \cs_gset_eq:NN __shipout_add_firstpage_specials: \prg_do_nothing:
180 }
```

The `\__shipout_drop_firstpage_specials:` is run after the shipout has occurred but before the `shipout/afterpage` hook is executed. That is the point where we have to restore the `\ShipoutBox` to its state without the `shipout/firstpage` material.

```
181 \cs_new:Npn __shipout_drop_firstpage_specials: {
182 \box_set_eq:NN \l_shipout_box \l__shipout_raw_box
```

If there was no such material then `\__shipout_run_firstpage_hook:` will have changed the definition to a no-op already. Otherwise this is what we do here.

```
183 \cs_gset_eq:NN __shipout_drop_firstpage_specials: \prg_do_nothing:
184 }
```

(End definition for `\_shipout_add_firstpage_specials`: and  
`\_shipout_drop_firstpage_specials`..)

`\l\_shipout_firstpage_box` The box to hold any firstpage \specials.

185 `\box_new:N \l\_shipout_firstpage_box`

(End definition for `\l\_shipout_firstpage_box`.)

`\g\_shipout_lastpage_handled_bool` A boolean to signal if we have already handled the `shipout/lastpage` hook.

186 `\bool_new:N \g\_shipout_lastpage_handled_bool`

(End definition for `\g\_shipout_lastpage_handled_bool`.)

`\_shipout_add_firstpage_material:Nn` This command adds material to the `shipout/firstpage` hook. It is used in `\AtBeginDvi`, etc. The first argument is the command through which it is called. Initially this is ignored but once we are passed the first page it can be used to generate a warning message mentioning the right user command.

187 `\cs_new:Npn \_shipout_add_firstpage_material:Nn #1#2 {`  
188     `\AddToHook{shipout/firstpage}{#2}`  
189     `}`

(End definition for `\_shipout_add_firstpage_material:Nn`.)

`\_shipout_get_box_size:N` Store the box dimensions in dimen registers.

*Todo: This could/should perhaps be generalized to set height depth and width given an arbitrary box.*

190 `\cs_new:Npn \_shipout_get_box_size:N #1 {`  
191     `\dim_set:Nn \l_shipout_box_ht_dim { \box_ht:N #1 }`  
192     `\dim_set:Nn \l_shipout_box_dp_dim { \box_dp:N #1 }`  
193     `\dim_set:Nn \l_shipout_box_wd_dim { \box_wd:N #1 }`  
194     `\dim_set:Nn \l_shipout_box_ht_plus_dp_dim`  
195         `{ \l_shipout_box_ht_dim + \l_shipout_box_dp_dim }`  
196     `}`

(End definition for `\_shipout_get_box_size:N`.)

`\l_shipout_box_ht_dim` And here are the variables set by `\_shipout_get_box_size:N`.

`\l_shipout_box_dp_dim`  
`\l_shipout_box_wd_dim`  
`\l_shipout_box_ht_plus_dp_dim`

(End definition for `\l_shipout_box_ht_dim` and others. These functions are documented on page 900.)

`\g\_shipout_discard_bool` Indicate whether or not the current page box should be discarded

201 `\bool_new:N \g\_shipout_discard_bool`

(End definition for `\g\_shipout_discard_bool`.)

`\l\_shipout_tmp_box` We need a box for the background and foreground material and a token register to remember badness settings as we disable them during the buildup below.

202 `\box_new:N \l\_shipout_tmp_box`  
203 `\tl_new:N \l\_shipout_saved_badness_tl`

(End definition for `\l__shipout_tmp_box` and `\l__shipout_saved_badness_t1`.)

`\l__shipout_add_background_box:n`: In standard L<sup>A</sup>T<sub>E</sub>X the shipout box is always a `\vbox` but here we are allow for other usage as well, in case some package has its own output routine.

```
204 \cs_new:Npn __shipout_add_background_box:n #1
205 { __shipout_get_box_size:N \l_shipout_box
```

But we start testing for a vertical box as that should be the normal case.

```
206 \box_if_vertical:NTF \l_shipout_box
207 {
```

Save current values of `\vfuzz` and `\vbadness` then change them to allow box manipulations without warnings.

```
208 \tl_set:Nx \l__shipout_saved_badness_t1
209 { \vfuzz=\the\vfuzz\relax
210 \vbadness=\the\vbadness\relax }
211 \vfuzz=\c_max_dim
212 \vbadness=\c_max_int
```

Then we reconstruct `\l_shipout_box` ...

```
213 \vbox_set_to_ht:Nnn \l_shipout_box \l_shipout_box_ht_plus_dp_dim
214 {
```

... the material in #1 is placed into a horizontal box with zero dimensions.

```
215 \hbox_set:Nn \l__shipout_tmp_box
216 { \l__shipout_saved_badness_t1 #1 }
217 \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
218 \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
219 \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
```

The we typeset that box followed by whatever was in `\l_shipout_box` before (unpacked).

```
220 \skip_zero:N \baselineskip
221 \skip_zero:N \lineskip
222 \skip_zero:N \lineskiplimit
223 \box_use:N \l__shipout_tmp_box
224 \vbox_unpack:N \l_shipout_box
```

The `\kern` ensures that the box has no depth which is afterwards explicitly corrected.

```
225 \kern \c_zero_dim
226 }
227 \box_set_ht:Nn \l_shipout_box \l_shipout_box_ht_dim
228 \box_set_dp:Nn \l_shipout_box \l_shipout_box_dp_dim
```

*Todo:* The whole boxing maneuver looks a bit like overkill to me, but for the moment I leave.

```
229 \l__shipout_saved_badness_t1
230 }
231 {
```

A horizontal box is handled in a similar way. The last case would be a void box in which case we do nothing hence the missing F branch.

```
232 \box_if_horizontal:NT \l_shipout_box
233 {
234 \tl_set:Nx \l__shipout_saved_badness_t1
235 { \hfuzz=\the\hfuzz\relax
```

```

236 \hbadness=\the\hbadness\relax }
237 \hfuzz=\c_max_dim
238 \hbadness=\c_max_int
239 \hbox_set_to_wd:Nnn \l_shipout_box \l_shipout_box_wd_dim
240 {
241 \hbox_set:Nn \l_shipout_tmp_box
242 { \l_shipout_saved_badness_tl #1 }
243 \box_set_wd:Nn \l_shipout_tmp_box \c_zero_dim
244 \box_set_ht:Nn \l_shipout_tmp_box \c_zero_dim
245 \box_set_dp:Nn \l_shipout_tmp_box \c_zero_dim
246 \box_move_up:nn
247 \l_shipout_box_ht_dim
248 { \box_use:N \l_shipout_tmp_box }
249 \hbox_unpack:N \l_shipout_box
250 }
251 \l_shipout_saved_badness_tl
252 }
253 }
254 }

(End definition for __shipout_add_background_box:n)

```

### \\_\_shipout\_add\_foreground\_box:n

Foreground boxes are done in the same way, only the order and placement of boxes has to be done differently.

```

255 \cs_new:Npn __shipout_add_foreground_box:n #1
256 {
257 \box_if_vertical:NTF \l_shipout_box
258 {
259 \tl_set:Nx \l_shipout_saved_badness_tl
260 { \vfuzz=\the\vfuzz\relax

296 { \l__shipout_saved_badness_tl #1 }
297 \box_set_wd:Nn \l__shipout_tmp_box \c_zero_dim
298 \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
299 \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
300 \box_move_up:nn { \box_ht:N \l_shipout_box }
301 { \box_use:N \l__shipout_tmp_box }
302 \kern \box_wd:N \l_shipout_box
303 }%
304 \l__shipout_saved_badness_tl
305 }
306 }
307 }

(End definition for __shipout_add_foreground_box:n)

```

`\__shipout_init_page_origins:` Two constants holding the offset of the top-left with respect to the media box.

Setting the constants this way is courtesy of Bruno.

We delay setting the constants to the last possible place as there might be updates in the preamble or even in the `\begindocument` hook that affects their setup.

```

308 \cs_new:Npn __shipout_init_page_origins: {
309 \tl_const:Nx \c__shipout_horigin_tl
310 {
311 \cs_if_exist_use:NTF \pdfvariable { horigin }
312 { \cs_if_exist_use:NF \pdfhorigin { 1in } }
313 }
314 \tl_const:Nx \c__shipout_vorigin_tl
315 {
316 \cs_if_exist_use:NTF \pdfvariable { vorigin }
317 { \cs_if_exist_use:NF \pdfvorigin { 1in } }
318 }

```

After the constants have been set there is no need to execute this command again, in fact it would raise an error, so we redefine it to do nothing.

```

319 \cs_gset_eq:NN __shipout_init_page_origins: \prg_do_nothing:
320 }

(End definition for __shipout_init_page_origins:, \c__shipout_horigin_tl, and
\c__shipout_vorigin_tl.)

```

`\__shipout_picture_overlay:n` Put the argument into a `picture` environment that doesn't take up any size and uses `1pt` for `\unitlength`.

*Todo: Could perhaps be generalized as it might be useful elsewhere. For now it is not.*

```
321 \cs_new:Npn __shipout_picture_overlay:n #1 {
```

The very first time this is executed we have to initialize (and freeze) the origins.

```
322 __shipout_init_page_origins:
323 \kern -\c__shipout_horigin_tl \scan_stop:
324 \vbox_to_zero:n {
325 \kern -\c__shipout_vorigin_tl \scan_stop:
326 \unitlength 1pt \scan_stop:
```

This mimics a simple zero-sized picture environment. The `\hss` is need in case there is horizontal material (without using `\put` with a positive width).

```
327 \hbox_set_to_wd:Nnn \l__shipout_tmp_box \c_zero_dim
328 { \ignorespaces #1 \hss }
329 \box_set_ht:Nn \l__shipout_tmp_box \c_zero_dim
330 \box_set_dp:Nn \l__shipout_tmp_box \c_zero_dim
331 \box_use:N \l__shipout_tmp_box
332 \tex_vss:D
333 }
334 }
```

(End definition for `\__shipout_picture_overlay:n`.)

`\__shipout_add_background_picture:n` Put a `picture` env in the background of the shipout box with its reference point in the top-left corner.

```
335 \cs_new:Npn __shipout_add_background_picture:n #1 {
336 __shipout_add_background_box:n { __shipout_picture_overlay:n {#1} }
337 }
```

(End definition for `\__shipout_add_background_picture:n`.)

`\__shipout_add_foreground_picture:n` Put a `picture` env in the foreground of the shipout box with its reference point in the top-left corner.

```
338 \cs_new:Npn __shipout_add_foreground_picture:n #1 {
339 __shipout_add_foreground_box:n { __shipout_picture_overlay:n {#1} }
340 }
```

(End definition for `\__shipout_add_foreground_picture:n`.)

**\shipout\_discard:** Request that the next shipout box should be discarded. At the moment this is just setting a boolean, but we may want to augment this behavior that the position of the call is taken into account (in case L<sup>A</sup>T<sub>E</sub>X looks ahead and is not using the position for on the next page).

```
341 \cs_new_protected:Npn \shipout_discard: {
342 \bool_gset_true:N \g__shipout_discard_bool
343 }
```

(End definition for `\shipout_discard`:. This function is documented on page 902.)

### 3.2 Handling the end of job hook

At the moment this is partly solved by using the existing hooks. But rather than putting the code into these hooks it should be moved to the right place directly as we shouldn't prefill hooks with material unless it needs to interact with other code.

`\g_shipout_READONLY_int  
\ ReadonlyShipoutCounter`

We count every shipout activity that makes a page (but not those that are discarded) in order to know how many pages got produced.

344 `\int_new:N \g_shipout_READONLY_int`

For  $\text{\LaTeX} 2\epsilon$  it is available as a command (i.e., a  $\text{\TeX}$  counter only).

345 `\cs_new_eq:NN \ ReadonlyShipoutCounter \g_shipout_READONLY_int`

(*End definition for `\g_shipout_READONLY_int` and `\ ReadonlyShipoutCounter`. These functions are documented on page 903.*)

`\g_shipout_totalpages_int  
\c@totalpages`

We count every shipout attempt (even those that are discarded) in this counter. It is not used in the code but may get used in user code.

346 `\int_new:N \g_shipout_totalpages_int`

For  $\text{\LaTeX} 2\epsilon$  this is offered as a  $\text{\LaTeX}$  counter so can be easily typeset inside the output routine to display things like “`\thepage/\thetotalpages`”, etc.

347 `\cs_new_eq:NN \c@totalpages \g_shipout_totalpages_int`

348 `\cs_new:Npn \thetotalpages { \arabic{totalpages} }`

(*End definition for `\g_shipout_totalpages_int` and `\c@totalpages`. These functions are documented on page 903.*)

`\@abspage@last`

In `\@abspage@last` record the number of pages from the last run. This is written to the `.aux` and this way made available to the next run. In case there is no `.aux` file or the statement is missing from it we initialize it with the largest possible number in  $\text{\TeX}$ . We use this as the default because then we are inserting the `shipout/lastpage` on the last page (or after the last page) but not on page 1 for a multipage document.

349 `\xdef\@abspage@last{\number\maxdimen}`

(*End definition for `\@abspage@last`.*)

`\enddocument`

Instead of using the hooks `enddocument` and `enddocument/afterlastpage` we add this code to private kernel hooks to be 100% sure when it is executed and to avoid cluttering the hooks with data that is always there.

Inside `\enddocument` there is a `\clearpage`. Just before that we execute this code here. There is a good chance that we are on the last page. Therefore, if we don't know the value from the last run, we assume that the current page is the right one. So we set `\@abspage@last` and as a result the next shipout will run the `shipout/lastpage` code. Of course, if there are floats that still need a placement this guess will be wrong but then rerunning the document will give us the correct value next time around.

`\@kernel@after@enddocument`

350 `\g@addto@macro \@kernel@after@enddocument {`  
351    `\int_compare:nNnT \@abspage@last = \maxdimen`  
352    `{`

We use  $\text{\LaTeX} 2\epsilon$  coding as `\@abspage@last` is not an L3 name.

353       `\xdef\@abspage@last{ \int_eval:n { \g_shipout_READONLY_int + 1 } }`  
354       `}`  
355       `}`

Once the `\clearpage` has done its work inside `\enddocument` we know for sure how many pages this document has, so we record that in the `.aux` file for the next run.

```
356 \g@addto@macro \@kernel@after@enddocument@afterlastpage {
```

There is one special case: If no output is produced then there is no point in a) recording the number as 0 will never match the page number of a real page and b) adding an extra page to ran the `shipout/lastpage` is pointless as well (as it would remain forever). So we test for this and run the code only if there have been pages.

```
357 \int_compare:nNnF \g_shipout_READONLY_int = 0
358 {
```

This ends up in the `.aux` so we use L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  names here.

*Todo: This needs an interface for `\nofiles` in expl3, doesn't at the moment!*

```
359 \if@filesw
360 \iow_now:Nx \@auxout {
361 \gdef\string\@abspage@last {\int_use:N \g_shipout_READONLY_int}
362 \fi
```

But we may have guessed wrongly earlier and have run it too early or we still have to run the `shipout/lastpage` even though there is no page to place it into. If that is the case we make a trivial extra page and put it there. This temporary page will then vanish again on the next run but helps to keep pdf viewers happy. In either case we should put out an appropriate “rerun” warning.

```
363 \bool_if:NTF \g__shipout_lastpage_handled_bool
364 {
```

If the hook was already executed, we have to test if that total shipouts match the shipouts from last run (because that corresponds to the page it was executed). If not we output a warning.

```
365 \int_compare:nNnF \@abspage@last = \g_shipout_READONLY_int
366 {
367 \clatex@warning@no@line{Hook~'shipout/lastpage'~executed~
368 on~wrong~page~(\@abspage@last\space not~
369 \int_use:N\g_shipout_READONLY_int).MessageBreak
370 Rerun~to~correct~this}%
371 }
372 }
373 {
```

If the hook was not run, we need to add an extra page and place it there. However, making this extra page in case the hook is actually empty would be forcing a rerun without any reason, so we check that condition and also check if `\@kernel@after@shipout@lastpage` contains any code. If both are empty we omit the page generation.

```
374 \bool_lazy_and:nnF
375 { \hook_if_empty_p:n {shipout/lastpage} }
376 { \tl_if_empty_p:N \@kernel@after@shipout@lastpage }
377 {
378 \tex_shipout:D\vbox to\textheight
379 {
380 \hbox:n { \UseHook{shipout/lastpage}
381 \@kernel@after@shipout@lastpage }
```

This extra page could be totally empty except for the hook content, but to help the user understanding why it is there we put some text into it.

```
382 __shipout_excuse_extra_page:
383 \null
384 }
```

At this point we also signal to L<sup>A</sup>T<sub>E</sub>X's endgame that a rerun is necessary so that an appropriate message can be shown on the terminal. We do this by simply defining a command used as a flag and tested in `\enddocument`.

```
385 \cs_gset_eq:NN \@extra@page@added \relax
386 }
387 }
388 }
389 }
```

*(End definition for `\enddocument`, `\@kernel@after@enddocument`, and `\@kernel@after@enddocument@afterlastpage`.)*

`\_\_shipout\_excuse\_extra\_page:` Say mea culpa ...

```
390 \cs_new:Npn __shipout_excuse_extra_page: {
391 \vfil
392 \begin{center}
393 \bfseries Temporary~ page!
394 \end{center}
395 \LaTeX{} was~ unable~ to~ guess~ the~ total~ number~ of~ pages~
396 correctly.~ ~ As~ there~ was~ some~ unprocessed~ data~ that~
397 should~ have~ been~ added~ to~ the~ final~ page~ this~ extra~
398 page~ has~ been~ added~ to~ receive~ it.
399 \par
400 If~ you~ rerun~ the~ document~ (without~ altering~ it)~ this~
401 surplus~ page~ will~ go~ away,~ because~ \LaTeX{} now~ knows~
402 how~ many~ pages~ to~ expect~ for~ this~ document.
403 \vfil
404 }
```

*(End definition for `\_\_shipout\_excuse\_extra\_page`.)*

`\PreviousTotalPages`  
`\@kernel@before@begindocument` In the preamble before the aux file was read `\PreviousTotalPages` is always zero.

```
405 \def\PreviousTotalPages{0}
```

In the aux file there should be an update for `\@abspage@last` recording the number of pages from the previous run. If not that macro holds the value of `\maxdimen`. So we test for it and update `\PreviousTotalPages` if there was a real value. This should happen just before the `begindocument` hook is executed so that the value can be used inside that hook.

```
406 \g@addto@macro\@kernel@before@begindocument
407 {\ifnum\@abspage@last<\maxdimen
408 \xdef\PreviousTotalPages{\@abspage@last}\fi}
```

*(End definition for `\PreviousTotalPages` and `\@kernel@before@begindocument`. These functions are documented on page 903.)*

## 4 Legacy L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\epsilon$</sub> interfaces

`\DiscardShipoutBox` Request that the next shipout box is to be discarded.  
409 `\cs_new_eq:NN \DiscardShipoutBox \shipout_discard:`  
*(End definition for `\DiscardShipoutBox`. This function is documented on page 902.)*

`\AtBeginDvi` If we roll forward from an earlier kernel `\AtBeginDvi` is defined so we better not use `\cs_new_protected:Npn` here.  
410 `\cs_set_protected:Npn \AtBeginDvi`  
411 `{\_\_shipout_add_firstpage_material:Nn \AtBeginDvi}`  
*(End definition for `\AtBeginDvi`. This function is documented on page 902.)*

`\DebugShipoutsOn`  
`\DebugShipoutsOff` 412 `\cs_new_eq:NN \DebugShipoutsOn \shipout_debug_on:`  
413 `\cs_new_eq:NN \DebugShipoutsOff \shipout_debug_off:`  
*(End definition for `\DebugShipoutsOn` and `\DebugShipoutsOff`. These functions are documented on page 904.)*

## 5 Internal commands needed elsewhere

These internal commands use double and triple @ signs so we need to stop getting them translated to the module name.

414 `\ExplSyntaxOn`  
Some internals needed elsewhere.

422 `\_\_shipout_add_background_picture:n`  
423 `\cs_set_eq:NN \ExplSyntaxOn \shipout@add@foreground@picture@@n`  
424 `\_\_shipout_add_foreground_picture:n`  
*(End definition for `\ExplSyntaxOn` and others.)*

425 `\ExplSyntaxOff`

426 `\end{document} | latexrelease`

427 `\begin{document} \ExplSyntaxOn`

Rolling back here doesn't undefine the interface commands as they may be used in packages without rollback functionality. So we just make them do nothing which may or may not work depending on the code usage.

428 `\begin{document} \ExplSyntaxOn`  
429 `\end{document} \begin{document} \ExplSyntaxOn`  
430 `\end{document} \begin{document} \ExplSyntaxOn`

`\shipout}{Hook management (shipout)}`

If we roll forward then `\tex_shipout:D` may not be defined in which case `\shipout` does have its original definition and so we must not `\let` it to something else which is `\relax!`

```

431 <|latexrelease>\ifcsname tex_shipout:D\endcsname
432 <|latexrelease>\expandafter\let\expandafter\shipout
433 <|latexrelease> \csname tex_shipout:D\endcsname
434 <|latexrelease>\fi
435 <|latexrelease>
436 <|latexrelease>\let \RawShipout\@undefined
437 <|latexrelease>\let \ShipoutBox\@undefined
438 <|latexrelease>\let \ ReadonlyShipoutCounter \@undefined
439 <|latexrelease>\let \c@totalpages \@undefined
440 <|latexrelease>\let \thetotalpages \@undefined
441 <|latexrelease>
442 <|latexrelease>\let \DiscardShipoutBox \@undefined
443 <|latexrelease>\let \DebugShipoutsOn \@undefined
444 <|latexrelease>\let \DebugShipoutsOff \@undefined
445 <|latexrelease>
446 <|latexrelease>\DeclareRobustCommand \AtBeginDvi [1]{%
447 <|latexrelease> \global \setbox \@begindvibox
448 <|latexrelease> \vbox{\unvbox \@begindvibox #1}%
449 <|latexrelease>}
450 <|latexrelease>
451 <|latexrelease>\let \AtBeginShipout \@undefined
452 <|latexrelease>\let \AtBeginShipoutNext \@undefined
453 <|latexrelease>
454 <|latexrelease>\let \AtBeginShipoutFirst \@undefined
455 <|latexrelease>
456 <|latexrelease>\let \ShipoutBoxHeight \@undefined
457 <|latexrelease>\let \ShipoutBoxDepth \@undefined
458 <|latexrelease>\let \ShipoutBoxWidth \@undefined
459 <|latexrelease>
```

We do not undo a substitution when rolling back. As the file support gets undone the underlying data is no longer used (and sufficiently obscure that it should not interfere with existing commands) and properly removing it would mean we need to make the `\undeclare@...` and its support macros available in all earlier kernel releases which is pointless (and actually worse).

```

460 <|latexrelease>
461 <|latexrelease>\let \AtEndDvi \@undefined
```

We do not reenable a disabled package load when rolling back. As the file support gets undone the underlying data is no longer checked (and sufficiently obscure that it should not interfere with existing commands) and properly removing it would mean we need to make the `\reenable@package@load` command available in all earlier kernel releases which is pointless (and actually worse).

```

462 %\reenable@package@load{atenddvi}
463 <|latexrelease>
464 <|latexrelease>\EndIncludeInRelease
465 {*2ekernel}
```

## 6 Package emulation for compatibility

### 6.1 Package `atenddvi` emulation

`\AtEndDvi` This package has only one public command, so simulating it is easy and actually sensible to provide as part of the kernel.

```
466 </2ekernel>
467 <*2ekernel | latexrelease>
468 <latexrelease>\IncludeInRelease{2020/10/01}%
469 <latexrelease> {\AtEndDvi}{atenddvi emulation}%
470 \ExplSyntaxOn
471 \cs_new_protected:Npn \AtEndDvi #1 {\AddToHook{shipout/lastpage}{#1}}
472 \ExplSyntaxOff
```

As the package is integrate we prevent loading (no need to roll that back):

```
473 \disable@package@load{atenddvi}
474 {\PackageWarning{atenddvi}
475 {Functionality of this package is already\MessageBreak
476 provided by LaTeX.\MessageBreak\MessageBreak
477 It is there no longer necessary to load it.\MessageBreak
478 and you can safely remove it.\MessageBreak
479 Found on}}
480 </2ekernel | latexrelease>
481 <latexrelease>\EndIncludeInRelease
482 <latexrelease>\IncludeInRelease{0000/00/00}%
483 <latexrelease> {\AtEndDvi}{atenddvi emulation}%
484 <latexrelease>\let \AtEndDvi \undefined
485 <latexrelease>\EndIncludeInRelease
486 <*2ekernel>

(End definition for \AtEndDvi. This function is documented on page 902.)
```

```
487 </2ekernel>
```

### 6.2 Package `atbegshi` emulation

```
488 <*atbegshi-ltx>
489 \ProvidesPackage{atbegshi-ltx}
490 [2021/01/10 v1.0c
491 Emulation of the original atbegshi^^Jpackage with kernel methods]
```

`\AtBeginShipoutBox`

```
492 \let \AtBeginShipoutBox \ShipoutBox
```

(End definition for `\AtBeginShipoutBox`. This function is documented on page 904.)

`\AtBeginShipoutInit`

Compatibility only, we aren't delaying ...

```
493 \let \AtBeginShipoutInit \empty
```

(End definition for `\AtBeginShipoutInit`. This function is documented on page 905.)

`\AtBeginShipout`

Filling hooks

`\AtBeginShipoutNext`

```
494 \protected\long\def\AtBeginShipout #1{\AddToHook{shipout/before}{#1}}
495 \protected\long\def\AtBeginShipoutNext #1{\AddToHookNext{shipout/before}{#1}}
```

(End definition for \AtBeginShipout and \AtBeginShipoutNext. These functions are documented on page 905.)

\AtBeginShipoutFirst Slightly more complex as we need to know the name of the command under which the shipout/firstpage hook is filled.

```
496 \protected \def \AtBeginShipoutFirst
497 {\Expl@@@shipout@add@firstpage@material@Nn \AtBeginShipoutFirst}
```

(End definition for \AtBeginShipoutFirst. This function is documented on page 905.)

\AtBeginShipoutDiscard Just a different name.

```
498 \let \AtBeginShipoutDiscard \DiscardShipoutBox
```

(End definition for \AtBeginShipoutDiscard. This function is documented on page 905.)

\AtBeginShipoutAddToBox We don't expose them.

```
499 \let \AtBeginShipoutAddToBox
500 {\Expl@@@shipout@add@background@box@On}
501 \let \AtBeginShipoutAddToBoxForeground
502 {\Expl@@@shipout@add@foreground@box@On}
503 \let \AtBeginShipoutUpperLeft
504 {\Expl@@@shipout@add@background@picture@On}
505 \let \AtBeginShipoutUpperLeftForeground
506 {\Expl@@@shipout@add@foreground@picture@On}
```

(End definition for \AtBeginShipoutAddToBox and others. These functions are documented on page 904.)

\AtBeginShipoutOriginalShipout This offers the raw \shipout primitive of the engine. A page shipped out with this is not counted by \ReadonlyShipoutCounter counter and thus the mechanism to place \specials at the very end of the output might fail, etc. It should therefore not be used in new applications but is only provided to allow running legacy code. For new code use the commands provided by the kernel instead.

```
507 \ExplSyntaxOn
508 \cs_new_eq:NN \AtBeginShipoutOriginalShipout \tex_shipout:D
```

(End definition for \AtBeginShipoutOriginalShipout. This function is documented on page 905.)

\ShipoutBoxHeight This is somewhat different from the original in atbegshi where \ShipoutBoxHeight etc. only holds the \the\ht<box> value. This may has some implications in some use cases and if that is a problem then it might need changing.

```
509 \cs_new:Npn \ShipoutBoxHeight { \dim_use:N \l_shipout_box_ht_dim }
510 \cs_new:Npn \ShipoutBoxDepth { \dim_use:N \l_shipout_box_dp_dim }
511 \cs_new:Npn \ShipoutBoxWidth { \dim_use:N \l_shipout_box_wd_dim }
512 \ExplSyntaxOff
```

(End definition for \ShipoutBoxHeight, \ShipoutBoxWidth, and \ShipoutBoxDepth.)

```
513
```

If the package is requested we substitute the one above:

```
514 {*2ekernel}
515 \declare@file@substitution{atbegshi.sty}{atbegshi-ltx.sty}
516
```

### 6.3 Package **everyshi** emulation

This is now directly handled in that package so emulation is not necessary any more.

Rather important :-)

517 ⟨@@=⟩

# File Y

## ltoutput.dtx

### 1 Output Routine

#### 1.1 Floats

The ‘2ekernel’ code ensures that a `\usepackage{autoout1}` is essentially ignored if a ‘full’ format is being used that has the autoload file mode already in the format.

```
1 <defx>\begingroup
2 <defx>\makeatletter
3 <defx>\nfss@catcodes
4 <2ekernel>\expandafter\let\csname ver@autoout1.sty\endcsname\fmtversion
```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

```
5 <*2ekernel>
6 \message{output,}

* OUTPUT

```

#### PAGE LAYOUT PARAMETERS

```
\topmargin : Extra space added to top of page.
@twoside : boolean. T if two-sided printing
\oddsidemargin : IF @twoside = T
 THEN extra space added to left of odd-numbered
 pages.
 ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
 THEN extra space added to left of even-numbered
 pages.
\headheight : height of head
\headsep : separation between head and text
\footskip : distance separation between baseline of last
 line of text and baseline of foot.
 Note difference between \footSKIP and \headSEP.
\textheight : height of text on page, excluding head and foot
\textwidth : width of printing on page
\columnsep : IF @twocolumn = T
 THEN width of space between columns
\columnseprule : IF @twocolumn = T
 THEN width of rule between columns (0 if none).
\columnwidth : IF @twocolumn = T
 THEN ($\textwidth - \columnsep$)/2
 ELSE \textwidth
 It is set by the \twocolumn and
 \onecolumn commands.
```

- \@textbottom : Command executed at bottom of vbox holding text of page (including figures). The \raggedbottom command almost \let's this to \vfil (actually sets it to \vskip \z@ plus.0001fil). Should have depth 0pt.
- \@texttop : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to \relax by \raggedbottom and \flushbottom.

Page layout must initialize \@colht and \@colroom to \textheight.

#### PAGE STYLE PARAMETERS:

- \floatsep : Space left between floats.  
 \textfloatsep : Space between last top float or first bottom float and the text.  
 \topfigrule : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the \textfloatsep skip separating the floats from the text. Must occupy zero vertical space. (See \footnoterule.)  
 \botfigrule : Same as \topfigrule, but put after the \textfloatsep skip separating text from the floats at bottom of page.  
 \intextsep : Space left on top and bottom of an in-text float.  
 \dblfloatsep : Space between double-column floats.  
 \dbltextfloatsep : Space between top double-column floats and text.  
 \dblfigrule : Similar to \topfigrule, but for double-column floats.  
 \@fptop : Glue to go at top of float column – must be 0pt + stretch  
 \@fpsep : Glue to go between floats in a float column.  
 \@fpbot : Glue to go at bottom of float column – must be 0pt + stretch  
 \@dblfpsep, \@dblfpbot : Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use \insert\footins.

#### PAGE LAYOUT SWITCHES AND MACROS

- @twocolumn : Boolean. T if two columns per page globally.

#### PAGE STYLE MACROS AND SWITCHES

```

\@oddhead : IF @twoside = T
 THEN macro to generate head of odd-numbered
 pages.
 ELSE macro to generate head of all pages.
\@evenhead : IF @twoside = T
 THEN macro to generate head of even-numbered
 pages.
\@oddfoot : IF @twoside = T
 THEN macro to generate foot of odd-numbered
 pages.
 ELSE macro to generate foot of all pages.
\@evenfoot : IF @twoside = T
 THEN macro to generate foot of even-numbered
 pages.
@specialpage : boolean. T if current page is to have a special
 format.
\@specialstyle : If its value is foo then
 IF @specialpage = T
 THEN the command \ps@foo is executed to
 temporarily reset the page style parameters
 before composing the current page.
 This command should execute only \def's and
 \edef's, making only local definitions.

```

## FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.

When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

- \* For single-column page it equals `\textheight`.
- \* For double-column page it equals `\textheight - height` of double-column floats on page.

Note that some are set globally and some locally:

```

\@topnum :=G Maximum number of floats allowed on the top of a
 column.
\@toproom :=G Maximum amount of top of column devoted to floats-
 excluding \textfloatsep separation below the floats
 and \floatsep separation between them. For
 two-column output, should be computed as a function
 of \@colht.
\@botnum, \@botroom
 : Analogous to above.
\@colnum :=G Maximum number of floats allowed in a column,
 including in-text floats.
\@textmin :=L Minimum amount of text (excluding footnotes) that
 must appear on a text page.
 %% 27 Sep 85 : made local to
 %% \@addtocurcol and \@addtonextcol
 It is now also used locally in processing double
 floats.

```

`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\dblfloatplacement` sets the following parameters.

`\@dbltopnum` :=G Maximum number of double-column floats allowed at the top of a two-column page.

`\@dbltoproom` :=G Maximum height of double-column floats allowed at top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

`\@fptop` :=L `\@dblftop`

`\@fpsep` :=L `\@dblfpsep`

`\@fpbot` :=L `\@dblfpbot`

## OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

## CALLING THE OUTPUT ROUTINE

---

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty < or = -10000 in the output list. In the latter case, the penalty indicates why the output routine was called, using the following code.

| penalty | reason                                                                                          |
|---------|-------------------------------------------------------------------------------------------------|
| -10000  | <code>\pagebreak</code><br><code>\newpage</code>                                                |
| -10001  | <code>\clearpage</code> ( <code>\penalty -10000 \vbox{}</code> ) <code>\penalty -10001</code> ) |
| -10002  | float insertion, called from horizontal mode                                                    |
| -10003  | float insertion, called from vertical mode.                                                     |
| -10004  | float insertion.                                                                                |

Note: A float or marginpar puts the following sequence in the output list:

- (i) a penalty of -10004,
- (ii) a null \vbox
- (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a \newpage or \clearpage, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

## THE OUTPUT ROUTINE

---

### FUNCTIONS USED IN THE OUTPUT ROUTINE:

\@outputpage : Produces an output page with the contents of box \@outputbox as the text part.

Also sets \@colht :=G \textheight.

The page style is determined as follows.

```
IF @thispagestyle = true
 THEN use \thispagestyle style
 ELSE use ordinary page style.
```

\@tryfcolumn\FLIST : Tries to form a float column composed of floats from \FLIST (if nonempty) with the following parameters:

```
\@colht : height of box
\@fpmmin : minimum height of floats in the box
\@fpsep : interfloat space
\@ftpsep : glue at top of box
\@fpbot : glue at bottom of box.
```

If it succeeds, then it does the following:

```
* \@outputbox :=L the composed float box.
* @fcollmade :=G true
* \FLIST :=G \FLIST - floats put in box
* \@freelist :=G \@freelist + floats put in box
```

If it fails, then:

```
* @fcollmade :=G false
```

NOTE: BIT MUST BE A SINGLE TOKEN!

\@makefcolumn \FLIST : Same as \@tryfcolumn except that it fails to make a float column only if \FLIST is empty. Otherwise, it makes a float column containing at least the first box in \FLIST, disregarding \@fpmmin.

\@startcolumn :

Calls \@tryfcolumn@\deferlist. If \@tryfcolumn returns with (globally set) @fcollmade = false, then:

```
* Globally sets \@toplist and \@botlist to floats
```

from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.

- \* Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

#### `\@startdblcolumn` :

Calls `\@tryfcolumn\@dbldeferlist{8}`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

- \* Globally sets `\@dbltopl` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
- \* Globally sets `\@colht` to `\textheight` minus the height of the added floats.

#### `\@combinefloats` : Combines the text from box

`\@outputbox` with the floats from `\@topl` and `\@botl`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\TOPLIST` and `\BOTLIST` onto `\@freelist`, and makes those lists null.

#### `\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@topl` and `\@botl`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\maxdepth`.

#### `\@opcol` : Outputs a column whose text is in box `\@outputbox`

If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht :=G \textheight`, and calls `\@floatplacement`.

If `@twocolumn = true`, then:

If `@firstcolumn = true`, then it puts box `\@outputbox` into `\@leftcolumn` and sets `@firstcolumn :=G false`.

If `@firstcolumn = false`, then it puts out the current two-column page, any possible two-column float pages, and determines `\@dbltopl` for the next page.

## USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

---

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
 \write -1{} % Part of hack to make sure no
 \vbox{} % \write's get lost.
 \penalty -10001
END

\cleardoublepage == BEGIN \clearpage
 if @twoside = true and c@page is even
 then \hbox{} \newpage fi
 END

```

\twocolumn[BOX] : starts a new page, changing to twocolumn setting and puts BOX in a parbox of width \textwidth across the top. Useful for full-width titles for double-column pages.  
SURPRISE: The stretch from \dbltextfloatsep will be inserted between the BOX and the top of the two columns.

## FLOAT-HANDLING MECHANISMS

---

The float environment obtains an insertion number B from the \freelist (see below for a description of list manipulation), puts the float into box B and sets \count B to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: \vadjust{\penalty -10002}
- In vmode : \penalty -10003.

For a double-column float, it puts B onto the \dbldeferlist.

The float specifier has two components:

- \* A PLACEMENT SPECIFICATION, describing where the float may be placed.
- \* A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc.

The float specifier is encoded as follows, where bit 0 is the least significant bit.

| Bit | Meaning                                              |
|-----|------------------------------------------------------|
| 0   | 1 iff the float may go where it appears in the text. |
| 1   | 1 iff the float may go on the top of a page.         |
| 2   | 1 iff the float may go on the bottom of a page.      |
| 3   | 1 iff the float may go on a float page.              |
| 4   | 1 unless the PLACEMENT includes a !                  |
| 5   | 1 iff a type 1 float                                 |

6        1 iff a type 2 float  
etc.

A negative float specifier is used to indicate a marginal note.

## MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

---

A FLOAT LIST consisting of the floats in boxes `\boxa` ... `\boxN` has the form:

`\@elt \boxa ... \@elt \boxN`

where `\boxI` is defined by

`\newinsert\boxI`

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {\NONEMPTY}{\EMPTY} == %% NOTE: ASSUME \@elt
= \relax
 BEGIN assume that \LIST == \@elt \B1 ... \@elt \Bn
 if n = 0
 then EMPTY
 else \CS :=L \B1
 \LIST :=G \@elt \B2 ... \@elt \Bn
 NONEMPTY
 fi
 END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all I of bit  $\log_2 \NUM$  of the float specifiers of all the floats in `\LIST`.  
I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit  $\log_2 \NUM$  of its float specifier equal to 1.

Note:  $\log_2 [(\count I)/32]$  is the bit number corresponding to the type of float I. To see if there is any float in `\LIST` having the same type as float I, you run `\@bitor` with

`\NUM = [(\count I)/32] * 32.`

```
\@bitor\NUM\LIST ==
BEGIN
 @test :=G false
 { \@elt \CTR == if \NUM <> 0 then
 if \count\CTR / \NUM is odd
 then @test := true fi fi
```

```

 \LIST
}
END
```

\@cons\LIST\NUM : Globally sets \LIST := \LIST \* \@elt \NUM

```

\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
 \LIST :=G \LIST \@elt \NUM
}
```

## BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

|                |                                                            |
|----------------|------------------------------------------------------------|
| \@freelist     | : List of empty boxes for placing new floats.              |
| \@toplist      | : List of floats to go at top of current column.           |
| \@midlist      | : List of floats in middle of current column.              |
| \@botlist      | : List of floats to go at bottom of current column.        |
| \@deferlist    | : List of floats to go after current column.               |
| \@dbltoplist   | : List of double-col. floats to go at top of current page. |
| \@dbldeferlist | : List of double-column floats to go on subsequent pages.  |

## FLOAT-PLACEMENT ALGORITHMS

\@addtobot : Tries to put insert \@currbox on \@botlist.

Called only when:

- \* \ht BOX < \@colroom
- \* type of \@currbox not on \@deferlist
- \* \@colnum > 0
- \* @insert = false

If it succeeds, then:

- \* sets @insert true
- \* decrements \@botroom by \ht BOX
- \* decrements \@botnum and \@colnum by 1
- \* decrements \@colroom by \ht BOX + either \floatsep or \textfloatsep, as appropriate.
- \* sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or \@botlist.

Called only under same conditions as \@addtobot.

If it succeeds, then:

- \* sets @insert true
- \* decrements \@toproom or \@botroom by \ht BOX
- \* decrements \@colnum and either \@topnum or \@botnum by 1
- \* decrements \@colroom by \ht BOX + \floatsep

or `\textfloatsep`, as appropriate.

`\@addtocurcol` : Tries to add `\@currbox` to current column, setting  
  `@insert` true if it succeeds, false otherwise.  
  It will add `\@currbox` to top only if bit 0 of  
  `\count\@currbox` is 0, and to the bottom only if  
  bit 0 = 0 or an earlier float of the same type is  
  put on the bottom.  
  If the float is put in the text, then  
  `\penalty\interlinepenalty` is put  
  right after the float, before the following `\vskip`,  
  and `\outputpenalty :=L 0`.

`\@addtonextcol` : Tries to add `\@currbox` to the next column, setting  
  `@insert` true if it succeeds, false otherwise.

`\@addtobdblcol` : Tries to add `\@currbox` to the next double-column page,  
  adding it to `\@dbltoplist` if it succeeds and  
  `\@dbldefeolist` if it fails.

```

85 \newdimen\marginparpush

```

**\AtBeginDvi** We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

This interface is no longer used. Instead a new one is inside `ltshipout.dtx`. We only keep the box in case some old code refers to it directly (or we do some rollback).

```

86 \newbox\@begindvibox
87 %\DeclareRobustCommand \AtBeginDvi [1]{%
88 % \global \setbox \@begindvibox
89 % \vbox{\unvbox \@begindvibox #1}%
90 %}

```

(End definition for `\AtBeginDvi` and `\@begindvibox`. These functions are documented on page 902.)

**\@maxdepth** This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```

91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth

```

(End definition for `\@maxdepth`.)

**\paperheight** New `\paper...` registers.

```

93 \newdimen\paperheight
94 \newdimen\paperwidth

```

(End definition for `\paperheight` and `\paperwidth`.)

**\if@insert** Local switches first:

```

95 \newif \if@insert

```

**\if@fcolmade** These should definitely be global:

```

96 \newif \if@fcolmade
97 \newif \if@specialpage \@specialpagefalse

```

**\if@reversemarginpar** These should be global but are not always set globally in other files.

```

98 \newif \if@firstcolumn \@firstcolumntrue
99 \newif \if@twocolumn \@twocolumnfalse

```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```

100 \newif \if@twoside \@twosidefalse
101 \newif \if@reversemargin \@reversemarginfalse
102 \newif \if@mparswitch \@mparswitchfalse

```

This counter has been imported from ‘multicol’.

```
103 \newcount \col@number
104 \col@number \cne
```

(End definition for `\if@insert` and others.)

```

(End definition for `\cleardoublepage`.)

```

\onecolumn
141 <*2ekernel | fltrace>
142 \def\onecolumn{%
143 \clearpage
144 \global\columnwidth\textwidth
145 \global\hsize\columnwidth
146 \global\linewidth\columnwidth
147 \global\@twocolumnfalse
148 \col@number \@ne
149 \@floatplacement}

```

(End definition for `\onecolumn`.)

`\newpage` The two checks at the beginning ensure that an item label or run-in section title immediately before a `\newpage` get printed on the correct page, the one before the page break.

All three tests are largely to make error processing more robust; that is why they all reset the flags explicitly, even when it would appear that this would be done by a `\leavevmode`.

```

150 </2ekernel | fltrace>
151 <latexrelease>\IncludeInRelease{2017/04/15}%
152 <latexrelease> {\newpage}{Check depth of page}%
153 <*2ekernel | latexrelease | fltrace>
154 \def \newpage {%
155 \if@noskipsec
156 \ifx \@nodocument\relax
157 \leavevmode
158 \global \@noskipsecfalse
159 \fi
160 \fi
161 \if@inlabel
162 \leavevmode
163 \global \@inlabelfalse
164 \fi
165 \if@nobreak \nobreakfalse \everypar{} \fi
166 \par

```

The `\vfil` at the end of the macro before the break penalty will normally result in the page being run short, even with `\flushbottom` in effect (in contrast to the behavior of `\pagebreak`). However, if there is some explicit stretch on the page, say, a `\vfill`, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of `\prevdepth` is no longer taken into account by TeX. So we back up by that amount (or by `\maxdepth` if it is really huge), to mimic the normal behavior without the `\newpage`.

```

167 \ifdim\prevdepth>\z@
168 \vskip -%
169 \ifdim\prevdepth>\maxdepth

```

```

170 \maxdepth
171 \else

(*End definition for \newpage.*)

\@emptycol It may be better to use an invisible rule rather than an empty box here.

```
198 \def \@emptycol {\vbox{} \penalty -\@M}
```

(*End definition for \@emptycol.*)

\twocolumn There are several bug fixes to the two-column stuff here.

```

199 \def \twocolumn {%
200 \clearpage
201 \global \columnwidth \textwidth
202 \global \advance \columnwidth -\columnsep
203 \global \divide \columnwidth \tw@
204 \global \hsize \columnwidth
205 \global \linewidth \columnwidth
206 \global \twocolumntrue
207 \global \firstcolumntrue
208 \col@number \tw@

```

There is no reason to put a \@dblfloatplacement here since \@topnewpage ignores these settings. The \@floatplacement is needed in case this comes after some changes.

```

209 \@ifnextchar [\@topnewpage \@floatplacement
210 }
```

Note that here, getting a box from the freelist can assume success since this comes just after a `\clearpage`.

```

211 \long\def \@topnewpage [#1]{%
212 \@nodocument
213 \@next\@currbox\@freelist{}{}%
214 \global \setbox\@currbox
215 \color@vbox
216 \normalcolor
217 \vbox {%
218 \hsize\textwidth
219 \parboxrestore
220 \col@number \@ne
221 #1%
222 \vskip -\dbltextfloatsep
223 }%
224 \color@endbox

```

Added size test and warning message; perhaps we should use an error message.

```

225 \ifdim \ht\@currbox>\textheight
226 \ht\@currbox \textheight
227 \fi

```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from `\@addtobblcol`, plus some extra checks for error trapping.

```

228 \global \count\@currbox \tw@
229 \tempdima -\ht\@currbox
230 \advance \tempdima -\dbltextfloatsep
231 \global \advance \colht \tempdima
232 \ifx \dbltoplist \empty
233 \else
234 \@latex@error{Float(s) lost}\ehb
235 \let \dbltoplist \empty
236 \fi
237 \cons \dbltoplist \@currbox

```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```

238 \global \@dbltopnum \m@ne
239 <*trace>
240 \f@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
241 />trace

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be  $3\baselineskip$ , but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

242 \ifdim \@colht<2.5\baselineskip
243 \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
244 too tall on page \thepage}%
245 \emptycol
246 \if@firstcolumn
247 \else
248 \emptycol
249 \fi
250 \else
251 \global \vsize \@colht
252 \global \@colroom \@colht
253 \@floatplacement
254 \fi
255 }
```

(End definition for `\twocolumn` and `\@topnewpage`.)

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

256 \output {%
257 \let \par \@@par
258 \ifnum \outputpenalty<-\@M
259 \specialoutput
260 \else
261 \makecol
262 \opcol
```

Moved to `\opcol`: `\@floatplacement`.

```
263 \startcolumn
```

This loop could be replaced by an `\expandafter` tail recursion in `\startcolumn`.

```

264 \whilesw \if@fcolmade \fi
265 {%
266 (*trace)
267 \f@trace{PAGE: float \if@twocolumn column \else page \fi
268 completed}%
269 (/trace)
270 \opcol\startcolumn}%
271 \fi
272 \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\@colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\@emptycol` will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.

```

273 \ifdim \@colroom<1.5\baselineskip
274 \ifdim \@colroom<\textheight
275 \@latex@warning@no@line {Text page \thepage\space

293 }
```

*Historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments (not necessarily accurate any more):*

CHANGES TO `\@specialoutput`:

\* `\penalty\z@` changed to `\penalty\interlinepenalty` so `\samepage` works properly with figure and table environments.

(Changed 23 Oct 86)

\* Definition of `\@specialoutput` changed 26 Feb 88 so `\@pageht` and `\@pagedp` aren't changed for a marginal note.

(Change suggested by Chris Rowley.)

*End of historical L<sup>A</sup>T<sub>E</sub>X 2.09 comments.*

```

294 \gdef\@specialoutput{%
295 \ifnum \outputpenalty>-\@Mii
296 \@doclearpage
```

```

297 \else
298 \ifnum \outputpenalty<-\@Mii
299 \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
300 \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
301 \else

```

Note that `\boxmaxdepth` should not be set here since we wish to record the natural depth of the `holdpg` box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \@cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```

302 \global \setbox\@holdpg \vbox{%
303 \unvbox\@holdpg
304 \unvbox\@cclv

```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by TeX.

```

305 \setbox\@tempboxa \lastbox
306 \unskip
307 }%

```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```

308 \@pagedp \dp\@holdpg
309 \@pageht \ht\@holdpg
310 \unvbox \@holdpg

333 }\@latexbug

```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a `\nobreak` must be correct.

```

334 \ifnum \outputpenalty<\z@
335 \if@nobreak
336 \nobreak
337 \else
338 \addpenalty \interlinepenalty
339 \fi
340 \fi
341 \fi
342 \fi
343 }
344 </2ekernel | fltrace>

```

(End definition for `\output` and `\@specialoutput`.)

`\@testwrongwidth` Test if the float box has the wrong width when trying to place it into some area. (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

```

(End definition for `\@testwrongwidth` and `\f@depth`.)

### \@doclearpage

This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test `\@testwrongwidth{\box}` at suitable places. That is at places where a box is taken off the deferlist.

```

\@opcol Several changes in detail here.

```

465 〈*2ekernel | fltrace〉
466 \def \@opcol {%
467 \if@twocolumn

```

The funny-looking internal commands are interfacing with the new marks mechanism. We make sure (elsewhere) that those are always defined, even when we roll back, so here we add them unconditionally. This still need turning into a hook or config point eventually:

```

468 \@expl@@@mark@update@dblcol@structures@@
469 \@outputdblcol
470 \else
471 \@expl@@@mark@update@singlcol@structures@@
472 \@outputpage
473 〈*trace〉
474 \fl@trace{PAGE: one column (float? see above) page completed}%
475 〈/trace〉

```

Not needed since it comes after \@outputpage:

```

476 % \global\@colht\textheight
477 \fi

```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

478 \global \z@ \global \textfloatsheight \z@
479 \@floatplacement
480 }
481 〈/2ekernel | fltrace〉

```

(End definition for \@opcol.)

\@makecol We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```
482 {*2ekernel}
483 \gdef \@makecol {%
484 \ifvoid\footins
485 \setbox\@outputbox \box\@cclv
486 \else
487 \setbox\@outputbox \vbox {%
```

This \boxmaxdepth setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use \maxdepth otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```
488 \boxmaxdepth \@maxdepth
489 %
490 \unvbox \@cclv
491 %
492 \vskip-\@tempdima
493 \vskip \skip\footins
494 \color@begingroup
495 \normalcolor
496 \footnoterule
497 \unvbox \footins
498 \color@endgroup
499 }%
500 \fi
```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```
500 \let\@elt\relax
501 \xdef\@freelist{\@freelist\@midlist}%
502 \global \let \@midlist \empty
503 \combinefloats
```

The variations start here in case \enlargethispage has been used.

```
504 \ifvbox\@kludgeins
505 \makespecialcolbox
506 \else
```

This extra reboxing is only needed to add the \texttop and \textbottom but this could be done earlier, when the floats are added.

The \boxmaxdepth resetting here will have no effect unless \textbottom ends with a box or rule. So is this (or possibly \maxdepth) the correct value?

The \vskip -\dimen@ ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If \textbottom ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens within `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen0`.

```
507 \setbox\@outputbox \vbox to\@colht {%
508 % \boxmaxdepth \maxdepth %??
509 \@texttop
510 \dimen0 \dp\@outputbox
511 \unvbox\@outputbox
512 \vskip -\dimen0
513 \@textbottom
514 }%
515 \fi
516 \global \maxdepth \@maxdepth
517 }
```

(End definition for `\@makecol`.)

`\@reinserts` This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```
518 \gdef \@reinserts{%
519 \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
520 \ifvbox\@kludgeins\insert\@kludgeins
521 {\unvbox\@kludgeins}\fi
522 }
523
```

(End definition for `\@reinserts`.)

`\@makespecialcolbox` This implements certain variations in page-makeup.

```
524 (*2ekernel | fltrace)
525 \gdef \@makespecialcolbox {%
526 <*trace>
527 \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
528 dp \the\dp\@kludgeins\space
529 wd \the\wd\@kludgeins}%
530 }
```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```
531 \setbox\@outputbox \vbox {%
532 \@texttop
533 \dimen0 \dp\@outputbox
534 \unvbox\@outputbox
535 \vskip-\dimen0
536 }%
537 \@tempdima \@colht
538 \ifdim \wd\@kludgeins>\z@
```

Note that in this case (the \*-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the TeX level!).

This needs TeX3 otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

There should perhaps be an upper limit, of `0pt?`, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

539 \advance \@tempdima -\ht\@outputbox
540 \advance \@tempdima \pageshrink
541 {*trace}
542 \f@trace {Natural ht of col: \the \ht\@outputbox}%
543 \f@trace {\string \@colht: \the \@colht}%
544 \f@trace {Pageshrink added: \the \pageshrink}%
545 \f@trace {Hence, space added: \the \@tempdima}%
546 {/trace}
547 \setbox\@outputbox \vbox to \@colht {%
548 %
549 \boxmaxdepth \maxdepth
550 \unvbox\@outputbox
551 \vskip \@tempdima
552 \textbottom
553 }%

```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

553 \else
554 \advance \@tempdima -\ht\@kludgeins
555 {*trace}
556 \f@trace {Natural ht of col: \the \ht\@outputbox}%
557 \f@trace {\string \@colht: \the \@colht}%
558 \f@trace {Extra size added: -\the \ht \@kludgeins}%
559 \f@trace {Hence, height of inner box: \the \@tempdima}%
560 \f@trace {Max? pageshrink available: \the \pageshrink}%
561 {/trace}

```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

562 \setbox \@outputbox \vbox to \@colht {%
563 \vbox to \@tempdima {%

```

```

564 \unvbox\@outputbox
565 \@textbottom}%
566 \vss}%
567 \fi

```

Finally we need to explicitly make the insert box void.

```

568 {\setbox \@tempboxa \box \@kludgeins}%
569 (*trace)
570 \f10trace {kludgeins box made void}%
571 (/trace)
572 }
573 </2ekernel | ftrace>

```

(*End definition for \makespecialcolbox.*)

\@texttop These do nothing as a default.  
\@textbottom  
574 <2ekernel>  
575 \let \@texttop \relax  
576 \let \@textbottom \relax

589 \def {\@activechar@info{space}\space}%
590 \let'\active@math@prime}%
591 \endgroup

```

(*End definition for \@resetactivechars and \@activechar@info.*)

\@outputpage \@shipoutsetup \@writesetup The \color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \aftergroup. This

is because it must have the value `\relax` before macros coming from other uses of `\aftergroup` within this box are expanded.

Putting this into the `\aftergroup` token list does not affect the definition used in expanding the `\writes` because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an `\aftergroup` within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
592 {/2ekernel}
593 {latexrelease}\IncludeInRelease{2017/04/15}%
594 {latexrelease} {\@outputpage}{Reset language for hyphenation}%
595 {*2ekernel | latexrelease}
596 \def\@outputpage{%
```

The `\endgroup` is put in by `\aftergroup`.

```
597 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command `\@writesetup`.

```
598 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a pagebreak in `verbatim` does not prevent hyphenation in the page head.

```
599 \language\document@default@language
```

The `\catcode`\\ = 10` was removed as it was considered useless (presumably because nothing gets tokenized during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
600 \@resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
601 \global\let\@if@newlist\if@newlist
602 \global@\newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischyp
\let'\@acci\let`\@acci\let\=\@accii
\let\\@\normalcr
\let\par\@@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```

\parindent\z@

\parskip\z@skip

\everypar{}%

\leftskip\z@skip

\rightskip\z@skip

\parfillskip\@flushglue

\lineskip\normalineskip

\baselineskip\normalbaselineskip

\sloppy

```

603 \parboxrestore

... to here was in the command \writeshipout.

```

604 \shipout \vbox{%
605 \set@typeset@protect
606 \aftergroup \endgroup

```

Correct? or just restore by ending the group?

607 \aftergroup \set@typeset@protect

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \shipoutsetup.

```

608 \if@specialpage
609 \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%

711 <{*2ekernel}>

```

(End definition for `\@outputpage`, `\@shipoutsetup`, and `\@writesetup`.)

`\@begindvi` This unboxes stuff that must appear before anything else in the .dvi file, then returns that box register to the free list and cancels itself.

The stuff in the box should not add any typeset material to the page.

```

712 \def \begindvi{%
713 \unvbox \begindvibox
714 \global\let \begindvi \empty
715 }

```

(End definition for `\@begindvi`.)

\@combinefloats The \boxmaxdepth setting here was not made local to a box so was dangerous. It is needed only within the box made by \@cflt (and not normally even there), so it has been moved there; this also agrees with the original pseudocode.

```

716 \def \@combinefloats {%
717 % \boxmaxdepth \maxdepth

```

The setting of `\boxmaxdepth` here has no effect since the `\@outputbox` should already have depth zero. Even so, it would have no effect on the layout of the page.

```

766 {%\boxmaxdepth\maxdepth %% probably not needed, CAR
767 \unvbox\@tempboxa\vskip-\dblfloatsep

```

Here we need different typesetting if the top float comes from `\@topnewpage`.

```

768 \ifnum \@dbltopnum>\m@ne
769 \dblfigrule
770 \fi
771 \vskip \dbltextfloatsep

```

If pdf links are present in the galley and those links get broken across pages they have to end up being on the same level of boxing (even if not actually in the same structure) due to some engine restrictions in pdfTeX and LuaTeX. We therefore unbox `\@outputbox` here (which only contains a single `\hbox`) so that this case has the same boxing level as a normal twocolumn page without top floats.

```

772 \unvbox\@outputbox
773 }%
774 \fi
775 }
776 </2ekernel>

```

(End definition for `\@comflelt`, `\@comdblfllelt`, and `\@combinedblffloats`.)

`\@startcolumn`  
`\@startdblcolumn`

We could combine (most of) these two into `\@startcol <list>`. Note that `\@xstartcol` was only used once (i.e. in `\@startcolumn`); it has therefore been removed. This is not quite as efficient but it now has the same structure as `\@startdblcolumn`.

The empty-list test has been moved to `\@tryfcolumn`.

```

```

CHANGE TO \addtocurcol:  
 $\z@$  changed to  $\penalty\interlinepenalty$  so  $\samepage$  works properly with figure and table environments. (Changed 23 Oct 86)

There is also an  $\addpenalty\interlinepenalty$  above.

Since in 2e  $\samepage$  is no longer supported, these could be removed.

Although it is best to use  $\addvspace$  in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1150 \if@nobreak
1151 \nobreak
1152 \nobreakfalse
1153 \everypar{}%
1154 \else
1155 \addpenalty \interlinepenalty
1156 \fi
1157 \vskip \intextsep
1158 \box@\currbox
1159 \penalty\interlinepenalty
1160 \vskip\intextsep
1161 \ifnum\outputpenalty <- \Mii \vskip -\parskip\fi

```

Typesetting ends here.

```

1162 \outputpenalty \z@
1163 \inserttrue
1164 <*trace>
1165 \else
1166 \f@trace{Fail---no room at 2nd test of colroom

\@addmarginpar

```

1813 <*2ekernel>
1814 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox
1815 \@cons\@freelist\@currbox}\@latexbug\@tempcnta\@ne
1816 \if@twocolumn
1817 \if@firstcolumn \@tempcnta\m@ne \fi
1818 \else
1819 \if@mparswitch
1820 \ifodd\c@page \else\@tempcnta\m@ne \fi
1821 \fi
1822 \if@reversemargin \@tempcnta -\@tempcnta \fi
1823 \fi
1824 \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1825 \@tempdima\@mparbottom
1826 \advance\@tempdima -\@pageht
1827 \advance\@tempdima\ht\@marbox
1828 \ifdim\@tempdima >\z@
1829 \@latex@warning@no@line {Marginpar on page \thepage\space moved}%
1830 \else
1831 \@tempdima\z@
1832 \fi
1833 \global\@mparbottom\@pageht
1834 \global\advance\@mparbottom\@tempdima
1835 \global\advance\@mparbottom\dp\@marbox
1836 \global\advance\@mparbottom\marginparpush
1837 \advance\@tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

1838 \global\setbox\@marbox
1839 \vbox {\vskip \@tempdima
1840 \box \@marbox}%
1841 \global\ht\@marbox \z@
1842 \global\dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```
1843 \kern -\@pagedp
1844 \nointerlineskip
1845 \hb@xt@\columnwidth
1846 {\ifnum \atempcnta >\z@%
1847 \hskip\columnwidth \hskip\marginparsep
1848 \else
1849 \hskip -\marginparsep \hskip -\marginparwidth
1850 \fi
1851 \box\@marbox \hss}%

```

For this reason the following code can vanish:

```
\nobreak %% No longer needed. CAR92/12
\vskip -\tempdima %% No longer needed. CAR92/12

1852 \nointerlineskip
1853 \hbox{\vrule \height\z@ \width\z@ \depth\@pagedp}}%

```

(End definition for \addmarginpar.)

### 1.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L<sup>A</sup>T<sub>E</sub>X2e.

```
\enlargethispage{<dim>}
```

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

```
\enlargethispage*{<dim>}
```

Similar to \enlargethispage but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with \pagebreak) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a \clearpage: please give keep them clear of such places.

\@kludgeins The insert which makes T<sub>E</sub>X do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1854 \newinsert \@kludgeins
1855 \global\dimen\@kludgeins \maxdimen
1856 \global\count\@kludgeins 1000
```

(End definition for \@kludgeins.)

\enlargethispage The user command.

```

1857 \gdef \enlargethispage {%
1858 \@ifstar
1859 {%
1860 (*trace)
1861 \f@l@trace{Enlarging page height * }%
1862 }(/trace)
1863 \enlargepage{\hbox{\kern\p@}}%
1864 {%
1865 (*trace)
1866 \f@l@trace{Enlarging page height exactly---}%
1867 }(/trace)
1868 \enlargepage\@empty}%
1869 }
```

(End definition for `\enlargethispage` and `\enlargethispage*`.)

\enlargepage This actually inserts the insert, after checking for extreme values of the change.

```

1870 \gdef\enlargepage#1#2{%
1871 (*trace)
1872 \f@l@trace{\@spaces\@spaces by #2}%
1873 }(/trace)
1874 \tempskipa#2\relax
1875 \ifdim \tempskipa>.5\maxdimen
1876 \lat@error{Suggested\space extra\space height\space
1877 (\the\tempskipa)\space dangerously\space
1878 large}\@eha
1879 \else
1880 \ifdim \vsize<.5\maxdimen
1881 (*trace)
1882 \f@l@trace {Kludgeins added--pagegoal before: \the\pagegoal}%
1883 }(/trace)
1884 \bsphack
1885 \insert\kludgeins{#1\vskip-\tempskipa}%
1886 \esphack
```

This next bit is for tracing only:

```

1887 (*trace)
1888 \ifvmode \par
1889 \f@l@trace {Kludgeins added--pagegoal after: \the\pagegoal}%
1890 \fi
1891 }(/trace)
1892 \else
1893 \lat@error{Page\space height\space already\space
1894 too\space large}\@eha
1895 \fi
1896 \fi
1897 }
```

(End definition for `\enlargepage`.)

\ShowFloat This command provides some information about the contents of a float register. Float registers have internal names of the form `\bx@⟨Uppercase-letter(s)-or numbers⟩` and you specify just this letter or letters as the argument, e.g., `\ShowFloat{A}`. (There is not much error recovery if you specify something that isn't a float.)

```

1898 </2ekernel>
1899 <*2ekernel | latexrelease>
1900 <latexrelease>\IncludeInRelease{2021/11/15}%
1901 <latexrelease> {\ShowFloat}{Show float register contents}%
1902 \def\ShowFloat#1{\begingroup

1916 \f1@traceval{\wd#1}%
1917 {\tracingonline1\showboxbreadth10\showboxdepth3\showbox#1}%
1918 }

```

Here are two definitions from `fltrace` that make the above code work:

```

1919 \def \f1@traceval #1{\f1@trace{\string #1 = \the #1}}
1920 \def \f1@tracemessage #1{\let\@elt\@empty\typeout{LaTeX2e: #1}{}}
1921 </2ekernel | latexrelease>
1922 <latexrelease>\EndIncludeInRelease
1923 <latexrelease>\IncludeInRelease{0000/00/00}%
1924 <latexrelease> {\ShowFloat}{Show float register contents}%
1925 <latexrelease>
1926 <latexrelease>\let\ShowFloat\@undefined
1927 <latexrelease>\let\f1@ShowFloat\@undefined
1928 <latexrelease>\let\f1@traceval\@undefined
1929 <latexrelease>\let\f1@tracemessage\@undefined
1930 <latexrelease>\EndIncludeInRelease

```

(*End definition for `\ShowFloat`.*)

### 1.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in `LaTeX2e`.

`\suppressfloats`

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

`[t]` suppresses only floats at the top of the page `[b]` suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, `!`, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the following are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```
\f@trace Set-up tracing for floats independent of other tracing as it produces mega-output. Default
\f@tracefloatoff is no tracing.

\tracefloats 1931 {*f@trace}
\@f@traceval 1932 \def \f@tracemessage #1{{\let\@elt\empty\typeout{LaTeXe: #1}}}

(End definition for \suppressfloats and \@fstop.)

Manipulation of float placement and type; both their strings and the corresponding count registers.

\@fpstype First a new count register to go with \currtype.

\@reqcolroom Then a new skip register, for information needed to remove the \maxsep conservatism: it is possible that this could use a temporary register.

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of \addtocurcol which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

2022 \newcount \@fpstype
2023 \newdimen \@reqcolroom
2024 \newdimen \@textfloatsheight
2025
```

(End definition for \@fpstype, \@reqcolroom, and \@textfloatsheight.)

\@fpsadddefault Adds the default placement to what is already there.

Should not need to change this, but could do it as follows:

```

def \@fpsadddefault {%
 @temptokena \expandafter\expandafter\expandafter
 {\csname fpss@\@capttype \endcsname}%
 \edef \reserved@a {\the\@temptokena}%
 @onelevel@sanitize \reserved@a
 \edef \@fps {\@fps\reserved@a}%

2026
```

```

2104 \fi
2105 }
```

(End definition for \@resethfps.)

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \@addtoblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```
2106 \def \@flsetnum #1{%
2107 {*trace}
2108 \f@trace{fpstype: \the \fpstype (flsetnum \string#1)}%
2109 {/trace}
2110 \ifnum \fpstype<\sixt@n

(End definition for \@flupdates.)

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn` floatplacement was wrong: dbl not needed, ord needed.
3. `\@floatplacement` was not called after `\@startdblcol` or `\@topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just `h` and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘`th`’: this is only an error-recovery action, putting just `h` or `!h` should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltexfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.
7. After an `h` float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive `h` floats are separated by twice `\intextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an `h` float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just `p` fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.

14. The ! option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:
 

```
\twocolumn[\maketitle more text]
```

One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user's viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-\* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the vskip to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.  
It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the vskip adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.  
It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

\@opcol should do \@floatplacement, but where? Right at the end, since it always occurs at the start of a column.

```

\def\@opcol{%
% Why is this done first?
\global \c@mparbottom \z@
\if@twocolumn
 \outputdblcol
\else
 \outputpage
 % This is not needed since it is done at the end of
 % |\@outputpage|:
\global \c@colht \textheight
\fi}

```

Only tracing has been added to these.

### 1.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

#### Limits for the placement of floating objects

|                              |                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\c@topnumber</code>    | This counter holds the maximum number of floats that can appear at the top of a text page or column.                                     |
|                              | <pre> 2324 &lt;* 2ekernel&gt; 2325 \newcount\c@topnumber 2326 \setcounter{topnumber}{2} </pre> <i>(End definition for \c@topnumber.)</i> |
| <code>\topfraction</code>    | This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.        |
|                              | <pre> 2327 \newcommand\topfraction{.7} </pre> <i>(End definition for \topfraction.)</i>                                                  |
| <code>\c@bottomnumber</code> | This counter holds the maximum number of floats that can appear at the bottom of a text page or column.                                  |
|                              | <pre> 2328 \newcount\c@bottomnumber 2329 \setcounter{bottomnumber}{1} </pre> <i>(End definition for \c@bottomnumber.)</i>                |
| <code>\bottomfraction</code> | This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.     |
|                              | <pre> 2330 \newcommand\bottomfraction{.3} </pre>                                                                                         |

|                       |                                                                                                                                                                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Floats on a text page

\floatsep    When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

\textfloatsep is the space between adjacent floats that are placed at the top or bottom of the text page or column.

\intextsep is the space between the main text and floats at the top or bottom of the page or column.

\intextsep is the space between in-text floats and the text.

```
2339 \newskip\floatsep
2340 \newskip\textfloatsep
2341 \newskip\intextsep
2342 \setlength\floatsep {12\p@ \oplus 2\p@ \ominus 2\p@}
2343 \setlength\textfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}
2344 \setlength\intextsep {12\p@ \oplus 2\p@ \ominus 2\p@}
```

(End definition for \floatsep, \textfloatsep, and \intextsep.)

\dblfloatsep    When double-column floats (floating objects that span the whole \textwidth) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by \dblfloatsep and \dbltextfloatsep. They are rubber lengths.

\dblfloatsep is the space between adjacent double-column floats placed at the top of the text page.

\dbltextfloatsep is the space between the main text and double-column floats at the top of the page.

```
2345 \newskip\dblfloatsep
2346 \newskip\dbltextfloatsep
2347 \setlength\dblfloatsep {12\p@ \oplus 2\p@ \ominus 2\p@}
2348 \setlength\dbltextfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}
```

(End definition for \dblfloatsep and \dbltextfloatsep.)

## Floats on their own page or column

\@fptop    When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

\@fpsep    At the top of the page \@fptop is inserted; typically this supplies some stretchable whitespace. At the bottom of the page \@fpbot is inserted. Between adjacent floats \@fpsep is inserted.

\@fpbot    These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters \@fptop and \@fpbot should contain a plus ...fil so as to fill the remaining empty space.

```
2349 \newskip\fptop
2350 \newskip\fpsep
2351 \newskip\fpbot
2352 \setlength\fptop{0\p@ \oplus 1fil}
2353 \setlength\fpsep{8\p@ \oplus 2fil}
2354 \setlength\fpbot{0\p@ \oplus 1fil}
```

(End definition for \@fptop, \@fpsep, and \@fpbot.)

```
\@dblfpsep \newskip\@dblfpsep
2355 \newskip\@dblfpsep
2356 \newskip\@dblfpsep
2357 \newskip\@dblfpsep
2358 \setlength\@dblfpsep{0\p@ \oplus 1fil}
2359 \setlength\@dblfpsep{8\p@ \oplus 2fil}
2360 \setlength\@dblfpsep{0\p@ \oplus 1fil}
```

(End definition for `\@dblfpsep`, `\@dblfpbot`, and `\@dblfpbot`.)

`\topfigrule` The macros can be used to put in rules between floats and text; whatever they insert  
`\botfigrule` should be vertical mode material which takes up zero space.

```
\dblfigrule 2361 \let\topfigrule=\relax
2362 \let\botfigrule=\relax
2363 \let\dblfigrule=\relax
2364 {/2ekernel}
```

(End definition for `\topfigrule`, `\botfigrule`, and `\dblfigrule`.)

## File Z

### lthyphen.dtx

This file contains the code for loading hyphenation patterns into L<sup>A</sup>T<sub>E</sub>X. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L<sup>A</sup>T<sub>E</sub>X system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the `DOCSTRIP` program, or one can run this file directly through L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> .

```
1 <*driver>
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T<sub>E</sub>X's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 <*default>
8 \InputIfFileExists{hyphen.tex}%
9 {\message{Loading hyphenation patterns for US english.}%
10 \language=0
11 \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking `\@@end` (which is the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  name for T<sub>E</sub>X's `\end` primitive).

```
12 {\errhelp{The configuration for hyphenation is incorrectly
13 installed.^^J}%
14 If you don't understand this error message you need
15 to seek^Jexpert advice.}%
16 \errmessage{OOPS! I can't find any hyphenation patterns for
17 US english.^^J \space Think of getting some or the
18 latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
language=0
input hyphen % (or \input ushyphen1 if the file has been renamed)
language=1
input ghyp31
```

```
language=0
lefthyphenmin=2
righthyphenmin=3
endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

# File aa

## ltfinal.dtx

### 1 Final settings

This section contains the final settings for L<sup>A</sup>T<sub>E</sub>X. It initializes some debugging and typesetting parameters, sets the default \catcodes and uc/lc codes, and inputs the hyphenation file.

#### 1.1 Debugging

By default, L<sup>A</sup>T<sub>E</sub>X shows statistics:

```
1 <*2ekernel>
2 \tracingstats1
```

#### 1.2 Typesetting parameters

\@lowpenalty These are penalties used internally.  
\@medpenalty  
\@highpenalty

```
3 \newcount\@lowpenalty
4 \newcount\@medpenalty
5 \newcount\@highpenalty
```

(End definition for \@lowpenalty, \@medpenalty, and \@highpenalty.)

\newmarks Allocate extended marks types if etex is active. Placed here at the end of the format to increase compatibility with count allocations in earlier releases.

```
6 </2ekernel>
7 <*2ekernel | latexrelease>
8 <latexrelease>\IncludeInRelease{2015/01/01}%
9 <latexrelease> {\newmarks}{Extended Allocation}%
10 \ifx\marks\@undefined\else
11 \def\newmarks{%
12 \e@alloc\marks \e@alloc@chardef{\count256}\m@ne\@alloc@top}
13 \fi
14 </2ekernel | latexrelease>
15 <latexrelease>\EndIncludeInRelease
16 <latexrelease>\IncludeInRelease{0000/00/00}%
17 <latexrelease> {\newmarks}{Extended Allocation}%
18 <latexrelease>\let\newmarks\@undefined
19 <latexrelease>\EndIncludeInRelease
20 <*2ekernel>
```

(End definition for \newmarks.)

Allocate 3 mark classes to be used in \markboth and \markright. Should be done earlier but for that definition of \newmarks needs moving (which it should I guess).

```
21 </2ekernel>
22 <*2ekernel | latexrelease>
23 <latexrelease>\IncludeInRelease{2022/06/01}%
24 <latexrelease> {2e-left}{Delayed legacy marks}%
25 \NewMarkClass {2e-left}
```

```

26 \NewMarkClass {2e-right}
27 \NewMarkClass {2e-right-nonempty}
No rollback really, the marks will remain.
28 </2ekernel | latexrelease>
29 <latexrelease>\EndIncludeInRelease
30 <latexrelease>\IncludeInRelease{0000/00/00}%
31 <latexrelease> {2e-left}{Delayed legacy marks}%
32 <latexrelease>
33 <latexrelease>\EndIncludeInRelease
34 <*2ekernel>

\newXeTeXintercharclass Allocate \XeTeXintercharclass types if xetex is active. previously defined in xetex.ini.
\xe@alloc@intercharclass
\@alloc@intercharclass@top
35 </2ekernel>
36 <*2ekernel | latexrelease>

*(End definition for trace\string\_stack\string\_levels.)*

The default values of the picture and \fbox parameters:

```

149 \unitlength = 1pt
150 \fboxsep = 3pt
151 \fboxrule = .4pt

```

The saved value of T<sub>E</sub>X's \maxdepth:

```

152 \Qmaxdepth = \maxdepth

```

\vsize initialized because a \clearpage with \vsize < \topskip causes trouble.  
\@colroom and \@colht also initialized because \vsize may be set to them if a \clearpage is done before the \begin{document}

```

153 \vsize = 1000pt
154 \@colroom = \vsize
155 \@colht = \vsize

```

Initialise \textheight \textwidth and page style, to avoid internal errors if they are not set by the class.

```

156 \textheight=.5\maxdimen
157 \textwidth=\textheight
158 \ps@empty

```

### 1.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only \lccode but also other related data. The \lccode part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide \Umathcode.

```

223 <*2ekernel>

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
224 \lccode`-='`- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
225 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```

226 \def\reserved@a#1#2{%
227 @_tempcnta#1\relax
228 @_tempcntb#2\relax
229 \reserved@b
230 }
231 \def\reserved@b{%
232 \ifnum @_tempcnta> @_tempcntb\else
233 \reserved@c @_tempcnta
234 \advance @_tempcnta \ne
235 \expandafter \reserved@b
236 \fi
237 }
```

Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters.

```

238 \def\reserved@c#1{%
239 \count@=#1\advance \count@ by -"20
240 \uccode#1=\count@
241 \lccode#1=#1
242 }
```

```

243 \reserved@{\`a}{\`z}
244 \reserved@{"AO}{ "BC}
245 \reserved@{"E0}{ "FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcodes` set to 999.

```

246 \def\reserved@#1{%
247 \count@=\#1\advance\count@ by "20
248 \uccode#1=\#1
249 \lccode#1=\count@
250 \sfcodes#1=999
251 }
252 \reserved@{\`A}{\`Z}
253 \reserved@{"80}{ "9C}
254 \reserved@{"C0}{ "DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

255 \uccode`^Y=\`I % dotless i
256 \lccode`^Y=\^Y % dotless i
257 \uccode`^Z=\`J % dotless j, ae in OT1
258 \lccode`^Z=\^Z % dotless j, ae in OT1
259 \lccode`^9d=\`i % dotted I
260 \uccode`^9d=\^9d % dotted I
261 \lccode`^9e=\^9e % d-bar
262 \uccode`^9e=\^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```
263 \lccode`^=[\^[\`oe in OT1
```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```

264 \lccode`-\ =\`- % default hyphen char
265 \lccode 127=127 % alternate hyphen char
266 \lccode 23 =23 % textcompwordmark in T1

```

End of the conditional to select either Unicode or T1 encoding defaults.

```
267 \fi
```

At this stage, we can install any last-minute `expl3` set-up.

```

268 \Oexpl@finalise@setup@@
269 \def\@expl@finalise@setup@@{}}

```

This is as good a place as any to active a few XeTeX-specific settings

```

270 \ifx\XeTeXuseglyphmetrics\undefined
271 \else
272 \XeTeXuseglyphmetrics=1 %
273 \XeTeXdashbreakstate=1 %
274 \fi

```

## 1.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```

275 \InputIfFileExists{hyphen.cfg}

```

## 1.6 Input encoding

Starting with the 2018 L<sup>A</sup>T<sub>E</sub>X release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, encTeX or mltex.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```

346 </2ekernel>
347 <*2ekernel | latexrelease>

```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```

532 \reserved@af{`a}{`z}

```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab ( $\wedge I$ ), nl ( $\wedge J$ ), ff ( $\wedge L$ ) and cr ( $\wedge M$ ).

## 1.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their \uccode and \lccode values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the TeX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeTeX and LuaTeX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

533 \ifnum 0%
534 \ifx\Umathcode\@undefined\else 1\fi
535 \ifx\XeTeXmathcode\@undefined\else 1\fi
536 >\z@
537 \else
538 \def\reserved@c#1{%
539 \count@=#1\advance\count@ by -"20
540 \uccode#1=\count@
541 \lccode#1=#1
542 }
543 \reserved@a{\a}{\z}
544 \reserved@a{"A0}{ "BC}
545 \reserved@a{"E0}{ "FF}

```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```

546 \def\reserved@c#1{%
547 \count@=#1\advance\count@ by "20
548 \uccode#1=#1
549 \lccode#1=\count@
550 \sfcode#1=999
551 }
552 \reserved@a{\A}{\Z}
553 \reserved@a{"80}{ "9C}
554 \reserved@a{"C0}{ "DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

555 \uccode`^Y='I % dotless i
556 \lccode`^Y='^Y % dotless i
557 \uccode`^Z='J % dotless j, ae in OT1
558 \lccode`^Z='^Z % dotless j, ae in OT1
559 \lccode`^9d='i % dotted I
560 \uccode`^9d='^9d % dotted I
561 \lccode`^9e='^9e % d-bar
562 \uccode`^9e='^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

563 \lccode`^=[`^= % oe in OT1
564 \fi % End of reset block for 8-bit engines

```

\MakeUppercase  
\MakeLowercase  
\MakeTitlecase  
\NoCaseChange  
\AddToNoCaseChangeList  
\CaseSwitch  
\DeclareCaseChangeEquivalent

And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

Wrappers around the L3 case changing functions. \protected to make them mostly safe as replacements for uppercase and \lowercase.

In

```
\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}
```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```
\mark{\MakeUppercase Table of Contents}
{\MakeUppercase Table of Contents}
```

In order to get round this, we redefine `\MakeUppercase` and `\MakeLowercase` to grab their argument and brace it.

Earlier versions needed to process `\@cuclclist` in an `\edef` to handle legacy input encodings, but recent (2022) expl3 versions handle non-UTF8 text natively so we simply call the `\text_{...}.case:n` functions.

```
565 \ExplSyntaxOn
566 \cs_new_protected_nopar:cpn{MakeUppercase~}{\text_uppercase:n}
567 \cs_set_nopar:Npx\MakeUppercase#1{\use:c{MakeUppercase~}{#1}}
568 \cs_new_protected_nopar:cpn{MakeLowercase~}{\text_lowercase:n}
569 \cs_set_nopar:Npx\MakeLowercase#1{\use:c{MakeLowercase~}{#1}}
570 \cs_new_protected_nopar:cpn{MakeTitlecase~}{\text_titlecase:n}
571 \cs_set_nopar:Npx\MakeTitlecase#1{\use:c{MakeTitlecase~}{#1}}
572 \NoCaseChange protects its argument from the case change functions.
573 \AddToNoCaseChangeList Allows new commands to protect their arguments, eg
574 AddToNoCaseChangeList{\eqref} would protect the argument of \eqref in the same
575 way as the argument of \ref.
576 \cs_new_protected_nopar:Npn\AddToNoCaseChangeList
577 {\tl_put_right:Nn \l_text_case_exclude_arg_tl}
578 \AddToNoCaseChangeList{ \NoCaseChange }
579 \cs_new_eq:NN \CaseSwitch \text_case_switch:nnnn
580 \cs_new_eq:NN \DeclareCaseChangeEquivalent
581 \text_declare_case_equivalent:Nn
582 \ExplSyntaxOff
583 \def\@cuclclist{\oe\OE\o\O\ae\AE
584 \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\ij\IJ\th\TH}
```

(End definition for `\MakeUppercase` and others.)

## 1.8 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

Patch file code removed.

```
582 \%\\IfFileExists{ltpatch.ltx}
583 % {\typeout{=====
584 % Applying patch file ltpatch.ltx^^J%
585 % ======}
586 % \def\fmtversion@topatch{unknown}
587 % \input{ltpatch.ltx}
588 % \ifx\fmtversion\fmtversion@topatch
589 % \ifx\patch@level\@undefined
590 % \typeout{^^J^^J^^J%
```

```

591 % !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! ^J%
592 % !! Patch file 'ltpatch.ltx' not suitable for this^J%
593 % !! version of LaTeX.^J^J%
594 % !! Please check if initex found an old patch file:^J%
595 % !! --- if so, rename it or delete it, and redo the^J%
596 % !! initex run.^J%
597 % !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! ^J}%
598 % \batchmode \@@end
599 % \else

```

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

```

600 % \def\fmtversion@topatch{0}%
601 % \ifx\fmtversion@topatch\patch@level\else
602 % \def\reserved@a{\typeout##1##2\reserved@a{%
603 % \typeout{##1 patch level \patch@level}##2}
604 % \everyjob\expandafter\expandafter\expandafter{%
605 % \expandafter\reserved@a\the\everyjob\reserved@a}
606 % \let\reserved@a\relax
607 % \the\everyjob
608 % \fi
609 % \fi
610 % \else
611 % \typeout{^J^J^J}%
612 % !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! ^J%
613 % !! Patch file 'ltpatch.ltx' (for version <\fmtversion@topatch>)^J%
614 % !! is not suitable for version <\fmtversion> of LaTeX.^J^J%
615 % !! Please check if initex found an old patch file:^J%
616 % !! --- if so, rename it or delete it, and redo the^J%
617 % !! initex run.^J%
618 % !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! !!!!!!! ^J}%
619 % \batchmode \@@end
620 % \fi
621 % \let\fmtversion@topatch\relax
622 % }{}}

```

## 1.9 Freeing Memory

`\reserved@a` And just to make sure nobody relies on those definitions of `\reserved@b` and friends.  
`\reserved@b` These macros are reserved for use in the kernel. *Do not use them as general scratch macros.*

```

623 \let\reserved@a\@filelist
624 \let\reserved@b=\@undefined
625 \let\reserved@c=\@undefined
626 \let\reserved@d=\@undefined
627 \let\reserved@e=\@undefined
628 \let\reserved@f=\@undefined

```

(End definition for `\reserved@a` and `\reserved@b`.)

```

\toks
629 \toks0{}
630 \toks2{}
631 \toks4{}
632 \toks6{}

```

```
633 \toks8{}
```

(End definition for `\toks`.)

`\errhelp` Empty the error help message, which may have some rubbish:

```
634 \errhelp{}
```

(End definition for `\errhelp`.)

## 1.10 Initialise file list

`\@providesfile` Initialise for use in the document. During initex a modified version has been used which leaves debugging information for `latexbug.tex`.

```
635 \def\@providesfile#1[#2]{%
636 \wlog{File: #1 #2}%
637 \expandafter\xdef\csname ver@#1\endcsname{#2}%
638 }
```

(End definition for `\@providesfile`.)

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list built up

`\@addtofilelist` so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any L<sup>A</sup>T<sub>E</sub>X command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
639 \let\@filelist\@gobble
640 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

(End definition for `\@filelist` and `\@addtofilelist`.)

## 1.11 Preparation for supporting PDF in backends

At the current point in time, basic support for PDF in backends is not part of L<sup>A</sup>T<sub>E</sub>X core; it is provided by external packages. At some time in the future that work will be placed into the kernel but for now it is separate and has to be explicitly loaded in the document.

In that code there is a command `\IfPDFManagementActiveTF` which can be used by packages in order to execute different code depending on the whether this basic backend support is loaded.

To make this also work properly when this external package is not loaded at all, we here add this command already in the kernel (with a trivial definition); thus any package can query this loading state in all circumstances. Once this basic PDF backend support gets moved to the kernel, this definition will vanish again from here or, rather, it will be replaced by a real test.

`\IfPDFManagementActiveTF` So long as the code for the basic backend support for PDF is not loaded, the test that is implicit here will always return the false branch. Once this code is loaded, this definition will get replaced by a real test (as it is then possible that the management code is either activated or not activated).

```
641 \let \IfPDFManagementActiveTF \@secondoftwo
```

(End definition for `\IfPDFManagementActiveTF`.)

## 1.12 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

## 1.13 Some last minute initializations ...

Load the first aid set of definitions for external packages that await updates.

```
642 \@input{latex2e-first-aid-for-external-files.ltx}
```

## 1.14 Dumping the format

Finally we make @ into a letter, ensure the format will be in the ‘normal’ error mode, and dump everything into the format file.

```
643 \makeatother
644 \errorstopmode
645 \dump
646 </2ekernel>
```

# Change History
